

**DEVELOPING A BACTERIAL P450 AS A GENERAL AND REGIOSELECTIVE
CATALYST FOR C–H BOND OXIDATION**

by
Solymer Negretti

A dissertation submitted in partial fulfillment
of the requirements for the degree of
Doctor of Philosophy
(Medicinal Chemistry)
University of Michigan
2014

Doctoral committee:

Professor John Montgomery, *chair*

Professor Scott D. Larsen

Assistant Professor Pavel Nagorny

Professor David H. Sherman

DEDICATION

This dissertation is dedicated to my parents Juan Carlos and Angelina.

ACKNOWLEDGEMENTS

I would like to thank my advisor Professor John Montgomery for his guidance and support throughout my doctoral studies. Thank you for helping me develop as an independent scientist and thinker as well as for surrounding me with great co-workers that helped me learn the ropes of chemistry. I am particularly thankful to Dr. Grant Sormunen, Dr. Aireal Jenkins and Dr. Benjamin Thompson who were great in helping me get settled in the Montgomery lab. I would also like to thank Dr. Zachary Buchan, Dr. Allison Knauff, Dr. Katherine Partridge and Dr. Rafay Shareef for teaching me a lot of laboratory skills and for their guidance during my early years. As I progressed into seniority in my graduate studies, I had the great experience of working with younger students Michael Gilbert and Jessica Stachowski who in turn taught me a lot about how to be a good mentor. I would like to thank Professor David Sherman for being a like second advisor to me and allowing me to be part of this exciting collaborative project. I am very thankful to current and former members of his laboratory whom I have had the chance of working with, Dr. Shengying Li, Dr. Karoline Chiou and particularly Dr. Alison Narayan. I would also like to thank collaborators Prof. Larissa Podust at UCSF and Prof. Ken Houk at UCLA for their great contributions to the project. I am grateful to dissertation committee members Prof. Scott Larsen and Asst. Prof. Pavel Nagorny for enlightening discussions during committee meetings. I am grateful to Prof. Matthew Soellner for an enriching learning experience during my rotation in his laboratory which helped me to be successful in the laboratory of Prof. John Montgomery. I would like to acknowledge chemistry department staff

Roy Wentz, Dr. Eugenio Alvarado, Dr. James Windak and Paul Lennon for support with equipment and instrumentation.

Finally I would like to thank my family and friends for the support that has kept me going and allowed me to pursue my goals.

Abstract	xvi
Chapter I: Transition-Metal Based and Enzymatic C–H functionalization, Macrolide Natural Product Biosynthesis and the Cytochrome P450 PikC	1
1.1 Introduction.....	1
1.2 Transition metal based C–H functionalization strategies	1
1.2.1 Directed C–H functionalization	1
1.2.2 Remote directed C–H functionalization.....	6
1.2.3 Non-directed C–H functionalization.....	8
1.3 Enzymes in organic synthesis and C–H functionalization	12
1.4 Introduction to P450 Enzymes.....	15
1.5 Biosynthesis of macrolide natural products, introduction to the pikromycin pathway and the cytochrome P450 PikC.....	18
1.5.1 Macrolide natural products	18
1.5.2 Pre-oxidation enzymatic tailoring of the pikromycin pathway natural products	19

1.5.3 PikC mediated oxidation of pikromycin and YC-17	22
1.5.4 Replication of PikC activity in vivo and in vitro	24
1.6 Summary and outlook.....	25
Chapter II: Replacing desosamine with simplified removable anchoring groups for unnatural substrates.....	27
2.1 Introduction: PikC mediated oxidation of carbolides	27
2.2 Replacing desosamine with simple ethers and esters with a terminal dimethylamino group	30
2.2.1 Synthetic attachment of unnatural anchors	31
2.2.2 Results from PikC _{D50N} -RhFRED oxidation of cycloalkyl ether and alkyl ester derivatives	32
2.2.3 Characterization of PikC _{D50N} -RhFRED reaction products	35
2.2.4 Co-crystal structure of cycloalkyl derivative in the Pik _{D50N} active site.....	38
2.3 10-deoxymethynolide and narbonolide core substrates with unnatural anchoring groups.....	39
2.3.1 Isolation of narbonolide and 10-deoxymethynolide	39
2.3.2 Hydroxylation of unnatural YC-17 and pikromycin derivatives by PikC ...	40
2.3.3 Crystallographic data of 10-dml derivatives	44
2.3.4 Product characterization.....	46
2.4 Conclusions and outlook.....	48
2.5 Collaborator acknowledgements	49
Chapter III: Exploring the structural requirements for selectivity in 12-membered macrolide hydroxylation	50

3.1 Introduction.....	50
3.2 Macrolactone 55.....	50
3.2.1 Rationale	50
3.2.2 Synthesis	52
3.2.3 PikC _{D50N} -RhFRED oxidation studies.....	53
3.3 Increasing substitution in macrolactone analogues	54
3.3.1 Rationale	54
3.3.2 Synthesis of ethyl-substituted macrolactone	55
3.3.3 Synthesis of enone-substituted macrolactones	56
3.4 Additional determination of bio-activity	58
3.5 Conclusions and outlook.....	58
3.6 Collaborator acknowledgements.....	59
Chapter IV: Expanding the substrate scope of the PikC catalyzed hydroxylation to include small ring systems	60
4.1 Introduction	60
4.2 Moderately regioselective hydroxylation of small bicyclic systems	60
4.3 PikC catalyzed hydroxylation of 6-membered ring systems	62
4.3.1 Menthol series	62
4.3.2 Additional 6-membered ring substrates to understand hydroxylation selectivity	66
4.4 Conclusions and outlook.....	68
4.5 Collaborator acknowledgements.....	68
Chapter V: Conclusions and Future Directions	70

Chapter VI: Experimental Supporting Information	73
6.1 General Protocols.....	73
6.2 Chapter II Experimental.....	75
6.2.1 General procedure for ester hydrolysis	75
6.2.2 Experimental for PikC substrates and intermediates, hydroxylated standards and intermediates	75
6.2.3 Experimental data for PikC control substrates	98
6.3 Chapter 3 Experimental	102

ABSTRACT

The biosynthetic macrolide P450 monooxygenase $\text{PikC}_{\text{D50N}}$ -RhFRED has been employed as a biocatalyst for the stereo- and regioselective oxidation of C–H bonds. Previous results from collaborative work between the Montgomery, Podust and Sherman groups reported employing $\text{PikC}_{\text{D50N}}$ -RhFRED for the moderately regioselective hydroxylation of several desosamine linked carbocyclic rings, proving PikC to be capable of oxidizing unnatural substrates. The *N,N*-dimethylamino group in desosamine anchors the substrates in the active site and enables hydroxylation.

This thesis describes the expansion the substrate scope of the $\text{PikC}_{\text{D50N}}$ -RhFRED hydroxylation of unnatural substrates, by probing structural modifications in the aglycone and replacing desosamine with anchoring groups that are easier to synthesize and cleave from the substrates to develop this enzymatic reaction as a synthetic tool for the selective oxidation of C–H bonds. Through substrate engineering, optimized the regioselectivity and stereoselectivity of the oxidation and insights into the factors site-selectivity of PikC catalyzed hydroxylation were gained. A benzylic *N,N*-dimethylamino anchoring group effectively controlled the regioselectivity of the reaction of 10-deoxymethynolide derivatives while unnatural anchors had little effect on the regioselectivity of the enzymatic oxidation of simple carbocycles.

The degree of structural complexity necessary for selective oxidation for 12-membered ring macrolides was probed by synthesis of variety of 12-membered macrolide analogues that more closely resemble the endogenous substrates from PikC . We found it is possible to modestly

control selectivity by the choice of anchor, in systems with moderate functionality. Finally, $\text{PikC}_{\text{D50N}}\text{-RhFRED}$ was employed as a bio-catalyst for the selective hydroxylation of small-molecules by coupling of alcohols with larger linkers containing the dimethylamino anchor.
