This Draft: March 27, 2015

Abstract

Using a novel hand-collected dataset of 17,331 publicly listed firms from 52 countries and their international subsidiaries, we investigate the motives for establishing subsidiaries in tax havens. We document five sets of results. First, a 1 percentage point reduction in firms' home-country corporate tax rate is associated with a 1.2 percent increase in value of firms without tax haven subsidiary while firms with tax haven subsidiary are unaffected. Second, the signing of Tax Information Exchange Agreements (TIEAs) increases average shareholder value by 2.5 percent. Third, the positive effect is stronger for firms with more complex firm structure within the tax haven. Fourth, firms respond to TIEAs by engaging in *haven hopping*, i.e. moving their subsidiaries from tax havens that entered TIEAs to tax havens that did not. Fifth, TIEAs do not increase average shareholder value of firms that engage in haven hopping. These results suggest that tax haven subsidiaries are used for entrenchment activities beyond pure tax saving.

Keywords: Tax havens, firm value, entrenchment, tax avoidance

Preliminary. We have benefitted from comments by Hans Christensen, Michael Faulkender (discussant), John Graham, Denis Gromb, Maria Guadalupe, Charlie Hadlock, Niels Johannesen, Pedro Matos, Urs Peyer, and Joel Slemrod (discussant). We thank the participants of the UBC Winter Finance Conference as well as seminars at Chulalongkorn University, INSEAD (Economics, Finance), and the University of Michigan (Finance, Public Finance, Economics and Finance Day).

1. Introduction

A tax haven is a state or territory where corporate and personal tax rates are so low that foreign companies – or individuals – have incentives to establish shell companies to shield their income from higher tax liabilities at home. The OECD estimates that between USD 5 trillion and USD 7 trillion were held offshore in 2007; a study by *PriceWaterhouseCoopers* reveals that between USD 21 trillion and USD 32 trillion were held offshore in 2012. The US organization *Citizens for Tax Justice* finds that three in four Fortune 500 firms are active in tax havens and that the thirty US firms with highest offshore investment collectively hold USD 1.2 trillion in tax havens. In early 2014, the press uncovered prominent tax schemes involving companies such as Apple and Starbucks. In November 2014, the *Luxembourg Tax Leak* brought to light that close to 400 large international companies had made private arrangements with the Luxembourgish tax authority to pay less than 1% in tax – the official Luxembourgish corporate tax rate is 29%. While this will likely become a major policy issue in the European Union in the coming years, the US has shown a strong interest in regulating the use of offshore tax havens ever since first signing tax information exchange agreements with tax havens more than 15 years ago.¹

Despite the large amount of tax shielding that takes place in international corporations and the enormous attention tax havens have received in policy making and media, relatively little is known about the motives for multinational corporations to establish tax haven subsidiaries.² In this paper, we show that tax havens are used for activities that go beyond the pure tax saving motive. We provide evidence from a novel hand-collected dataset covering 17,331 publicly listed firms from 52 countries and their circa 232,000 domestic and foreign subsidiaries.

Saving corporate taxes is the most analyzed motive for establishing subsidiaries in tax havens (e.g. Hines and Rice 1990, Graham and Tucker 2006). Typically, firms pursue little operational activities in tax haven subsidiaries yet revenues can be shifted from high-tax environments to tax haven subsidiaries. For instance, firms can register patents, licenses, or trademarks in tax haven subsidiaries and charge operational subsidiaries in high tax environments for using these assets.

¹ The public debate largely focuses on the costs of tax havens for high tax countries yet some studies show that low tax regimes have positive spillovers on nearby high tax regimes (e.g. foreign direct investment, subsidiary investment and growth, and mitigation of tax competition – see Dharmapala 2008, Desai, Foley and Hines 2004 & 2006A, and Slemrod and Wilson 2006).

² As we will outline in more detail below, the empirical literature has by and large focused on US firms, with focus on their motive to use tax haven subsidiaries for tax motives (Dyregang and Lindsey 2009, Dyregang et al. 2013). Hanlon and Heitzman (2010) summarize academic research on motives and determinants of tax avoidance more broadly; Graham et al. 2014 provide evidence from a survey of tax executives.

This strategy reduces the firm's tax bill though it may lock cash in tax havens if the repatriation of foreign revenues or income gives rise to repatriation taxes (e.g. Hanlon et al. 2014).

In this paper, we show that corporate tax havens come at a cost. Insiders have motives for establishing subsidiaries in tax havens that go beyond tax savings: These motives may reduce shareholder value.

One illustrative example of using tax havens to transfer resources from investors to third parties was uncovered in courts after the collapse of Enron in 2002. Enron CFO Andrew Fastow created a staggering 881 offshore subsidiaries, 692 thereof in the Cayman Islands, 119 in Turks and Caicos, 43 in Mauritius, and 8 in Bermuda. Not only did this network of subsidiaries allow Enron to avoid paying taxes but the court case also revealed that Fastow and his friends were able to transfer considerable resources to companies that they controlled outside of Enron. In particular, Fastow and his friends constructed Special Purpose Entities with names such as CHIWCO, LJM1, and LJM2 (LJM are the initials of Fastow's wife and children). These and other Special Purpose Entities allowed Fastow and his friends to transfer at least USD 42 million to their own accounts, which contributed significantly to the downfall of Enron. In hindsight, the complex structure of tax haven subsidiaries served a dual purpose, allowing Enron to save taxes and Fastow and his friends to enrich themselves on account of the shareholders.

The Enron case highlights the importance of a complex structure for entrenchment. For aggressive tax planning, it is sufficient to transfer tangible and intangible asset to one or a few shell companies in tax havens – a complex corporate structure in the tax haven is not pivotal. On the other hand, if entrenched managers and potentially controlling owners use tax haven subsidiaries for their own private interests, it is important to set up a complex structure that deters non-controlling shareholders and other monitors such as tax authorities and auditors from unveiling the flow of resources within the firm. The main contribution of this paper is to provide novel evidence that tax haven activities are driven by entrenchment motives that go beyond the interest of saving corporate taxes and that entrenchment activities are correlated with firm complexity.

Our data reveals that firms using tax haven subsidiaries are indeed more complex, measured by the number of subsidiaries and hierarchical depth. Complex structure coupled with lack of transparency of tax havens makes monitoring difficult and provides managers and controlling

owners with opportunities to pursue goals that are not aligned with maximizing shareholder value. For instance, controlling managers may pile cash in tax havens to finance future activities such as inefficient acquisitions (Hanlon, Lester and Verdi 2014). Moreover, entrenchment can involve tunneling or outright theft e.g. through third party transactions. Such activities have been documented in environments that lack transparency and enforcement, e.g. in the context of Russia (Desai, Dyck and Zingales 2007 and Mironov 2013). Tax haven subsidiaries may facilitate such activities even when firms are headquartered in high enforcement regimes.

We document three sets of results. First, we explore cross-country differences and changes in tax rates to provide evidence that tax haven activities are linked to tax savings. We find that tax haven subsidiaries are more prominent among firms headquartered in countries with high tax rates, particularly income tax rates. Exploiting reductions in corporate tax rates over the past 7 years, we document that a 1 percentage point reduction in firms' home-country corporate tax rate is associated with a 1.2% increase in value of firms without tax haven subsidiaries while firms with tax haven subsidiaries are unaffected. While these results are not surprising, they confirm and extend existing knowledge about the link between tax savings and corporate tax haven activities.

Second, we exploit the passage of Tax Information Exchange Agreements (TIEAs). TIEAs are bilateral agreements between countries and tax havens facilitating the exchange of information relevant for civil and criminal tax investigations against individuals and firms. Thus, TIEAs increase the likelihood that firms' and individuals' tax haven operations – such as potential tax evasion and/or transfer of corporate resources to third parties – are detected. While TIEAs do not directly affect tax rates or tax rules in either of the involved countries, they facilitate detection and regulatory enforcement and through this they may also facilitate the ability of non-controlling owners and market analysts to monitor corporate activity within the tax haven.

TIEAs provide a natural experiment to test if there is a managerial entrenchment motive embodied in corporations' activities in tax havens that extends beyond the pure tax saving interest. TIEAs do not directly affect corporate tax rates. Indirectly, information provided under these agreements may be helpful in detecting e.g. too aggressive transfer pricing schemes,

allowing tax authorities to reassess a firm's tax base. Thus, under the tax savings motive on its own, TIEAs would have zero or negative impact on firm value. If managers also use tax havens to hide, tunnel, or destroy resources, TIEAs facilitate the detection of such activities by owners and monitors. If managers use tax havens to their own benefits and TIEAs do not impact the ability to save taxes, we conjecture that the introduction of TIEAs can increase shareholder value. TIEAs are not without criticism³; however, even a small increase in the probability of detection constitutes an additional cost to insiders engaged in activities against the interest of owners because information obtained through TIEAs can be used in civil and criminal tax investigations. Furthermore, managers may be fired based on suspicion or even rumors whereas tax authorities need hard evidence that can be brought to court. Thus, under the entrenchment motive, shareholders should endorse TIEAs as they have a positive impact on firm value through increasing the expected managerial cost of wasting corporate resources for their own private interest.

TIEAs provide an ideal experimental setting not only because they enable us to separate the two main motives to use tax havens but also because they are bilateral: They affect some firms headquartered in one signatory country with operations in the other signatory country (the tax haven) while leaving other firms with operations in different tax havens or headquartered in different countries unaffected. More than 500 TIEAs were passed at different points in time over the past 15 years, affecting more than 300 publicly listed firms headquartered in different countries and at different points in time. Above all, counterfactuals – such as publicly traded companies that are headquartered in one signatory country but that do not have tax haven subsidiaries – are easily identified.⁴

Using annual data, we show that the implementation of a TIEA increases average shareholder value, measured by Tobin's Q, by 2.5 percent on average. We re-confirm this result using daily

³ Among such criticism, Hanlon, Maydew and Thornock (2015) list that (i) information is only exchanged upon request rather than automatically, (ii) bank secrecy laws remain unaffected from the passage of TIEAs, and (iii) exchanged information is limited to information collected by signatory countries. It is important to emphasize that almost all TIEAs cover both tax haven activities by individuals and firms.

⁴ Few papers have exploited the passage of TIEAs. Johannesen and Zucman (2014) show that after the passage of TIEAs, bank deposits are shifted from affected to unaffected tax havens. German foreign direct investment and the number of German subsidiaries in tax havens declined after Germany passed TIEAs (Braun and Weichenrieder 2014). Bilicka and Fuest (2014) document that TIEAs are typically passed between countries and tax havens with stronger economic links though we do not confirm this result when we measure economic links by the number of foreign subsidiaries in tax havens. Hanlon, Maydew and Thornock (2015) document that TIEAs help reduce round-tripping tax evasion.

abnormal stock returns around the signing of TIEAs, reducing the concern that the signing of TIEAs coincides with similar policy changes that may occur within the same year.⁵ This result provides strong evidence that shareholders and investors applaud the introduction of TIEA, supporting the notion that corporate tax haven activities are used by managers and controlling owners for activities that benefit themselves beyond the pure tax saving interest.

Our third set of results documents drivers of the effect of TIEAs on shareholder value. First, we show that the impact of TIEAs on shareholder value is more positive for firms with greater involvement in tax havens. We measure involvement in tax havens by the number of subsidiaries in tax havens and the percentage of firm subsidiaries in tax havens. We argue that the complexity of a firm's structure within tax havens makes it even more difficult for the marginal investor to monitor controlling shareholders'/managers' activities within the tax haven while a more complex structure within tax havens is not more useful for saving taxes. Thus, the positive interaction effect between TIEAs and complexity within the tax haven provides additional support that tax havens are used for entrenchment activities.

Second, we document that the passage of TIEAs does not lead to significant increases in firms' efficiency, measured by gross margin and profit margin. Thus, it does not seem that our result is driven by an increase in operational activities and/or a reduction in managerial slack. Similar, it could be that the positive effect of TIEAs on shareholder value arises from a reduction in uncertainty because TIEAs may facilitate monitoring. While beta is not a perfect measure of investors' discount rate, we find that the passage of TIEAs is not associated with a reduction in treated firms' beta.

Third, we provide evidence that roughly one third of treated firms engage in *haven hopping*: They strategically move subsidiaries from tax havens that entered TIEAs to tax havens that did not. It is difficult to explain haven hopping with the tax savings motive, particularly as we do not observe a significant effect of TIEAs on effective tax rates. Haven hopping may suggest that our estimate of the true effect of TIEAs on firm value is understated, given that firms that move subsidiaries to tax havens that did not enter TIEAs do not become more transparent. Indeed, we

⁵ A further endogeneity concern arises from the fact that TIEAs may be passed between specific countries and tax havens at specific times, e.g. as a function of economic links. Measuring economic links by the number of subsidiaries for any country-tax haven pair, we do not confirm that TIEAs are passed with tax havens harboring particularly many or few affected subsidiaries.

find that the positive impact of TIEAs on treated firms is not present among firms that engage in haven hopping. As a side effect, haven hopping may also suggest that TIEAs benefit the least compliant tax havens.

Fourth, we show that the positive effect of TIEAs on firm value is smaller for firms with less institutional ownership. Institutional ownership is a proxy for the strength of monitoring and governance by non-controlling owner. Hence, our interpretation is that the positive shareholder effect of the introduction of TIEA is stronger for weakly governed firms, consistent with the notion that weakly governed firms might be more exposed to entrenchment by controlling owners/managers.

Taken together, these results provide novel evidence that corporate tax haven activities are driven by private motives of managers and/or controlling owners that extend beyond pure tax saving interests.

In addition to these key results, our cross-country setting with 52 countries allows us to add new evidence to the existing literature on the link between country characteristics and use of tax havens. We find that the use of tax havens is more prevalent in countries with higher income taxes and stronger regulatory enforcement even after controlling for economic development. While this evidence is far from causal, it is suggestive of notions that tax savings are more valuable when tax rates are high and that expropriation requires more complex mechanisms when regulatory enforcement is high. Thus, weaker regulatory enforcement in e.g. Russia (Desai, Dyck and Zingales 2007) or India may allow for outright tunneling or theft while stricter regulatory enforcement may require complex firm structures with non-transparent elements such as tax haven subsidiaries.

Of course, the benefit of a cross-country study comes at the cost of having to abstract away from institutional differences. One example of institutional differences is provided by the treatment of foreign income. For instance, Markle and Robinson (2012), studying 8,000 multinational firms from 28 countries, document a negative correlation between firms' tax rate in non-tax haven subsidiaries and the use of tax havens. This result is best explained by repatriation taxes and is confirmed in our data. In Germany, however, foreign income is tax exempt and consequently, manufacturing firms do not exhibit this negative relation (Gumpert, Hines and Schnitzer 2011).

In order to ensure that our results are not driven by specific countries, we remove countries individually from our analysis and our results are robust. A further concern with our analysis is that firms with tax haven subsidiary differ from other firms. Matching such firms by country, industry, size, and age, we re-confirm our results. Moreover, all results are robust to removing financial firms and to using alternative lists of tax haven territories to define tax haven firms. Our results on entrenchment are also robust to removing each event year individually from our analysis.

A few papers have provided by and large country-specific evidence on the use of tax haven subsidiaries. Desai, Foley and Hines (2006B) study US firms: large firms, more international firms, and firms with extensive intra-firm trade and high R&D intensity are more likely to use tax havens. US firms use large tax havens to reallocate taxable income and small tax havens to avoid taxation of foreign income in the US. Moreover, constrained firms are less likely to use tax haven subsidiaries (Dyreg and Markle 2013). In their international setting, Markle and Robinson (2012) document that tax haven firms are larger but – surprisingly – less R&D intensive. We find a positive relation between several measures of innovative activity (including R&D) and the use of tax havens. This relation is robust to adding additional controls (including country and industry fixed effects) and using alternative definitions of tax haven territories.

In terms of tax enforcement, the paper closest to ours is Desai, Dyck and Zingales (2007) who show that stronger tax enforcement reduces income diversion by insiders. Their model features a trade-off between tax enforcement's impact on taxes paid and the cost of income diversion to insiders. Empirically, Desai, Dyck and Zingales (2007) show that the Russian oil firm Sibneft earns positive abnormal returns over five tax enforcement actions in Russia, indicating that tax enforcement can have a positive impact on firm value. Linking this finding to private benefits of control, the authors then document that tax enforcement actions aimed at extractive industries lead to a reduction in the control premium compared to the reduction in control premium experienced by firms in other industries. This confirms a notion made by Dyck and Zingales (2004): The premium paid in block sales is negatively related to the strength of tax enforcement. These studies are supported by Mironov (2013): In Russia, tax enforcement correlates positively with operating performance. We contribute to this literature by showing that the enforcement channel is not restricted to weak institutional environments such as Russia.

A few papers have studied the link between tax savings and leverage. Heider and Ljungqvist (2012) document an asymmetric relation between changes in state-level tax rates and leverage adjustments. Faulkender and Smith (2014) construct a new measure of firm-specific foreign tax rates to show that US firms with higher such tax rate are more levered. In a carefully collected sample of 44 tax sheltering cases, Graham and Tucker (2006) show that firms engaged in tax sheltering have lower leverage than matched firms. Leverage – studied in this stream of the literature – and the use of corporate tax havens – studied in the paper at hand – can be regarded as substitute tax saving mechanisms. Both come with benefits but also with costs.

Many papers have examined the relation between firm-specific accounting measures of tax avoidance and firm value. Representatively, Desai and Dharmapala (2005) show that tax avoidance (measured at the firm level by the book-tax gap) has no effect on firm value on average but a positive effect among strongly governed firms. Hanlon and Heitzman (2010) summarize this literature in great detail and put it into perspective; they highlight that accounting-based measures of tax avoidance are not ideal for international studies because differences in e.g. the book-tax gap can be due to differences in accounting rules or due differences in e.g. expropriation of outside shareholders. Compared to a vast literature on accounting measures, we measure tax avoidance by identifying firms with tax haven subsidiary.

The paper is organized as follows. In Section 2, we define tax havens, introduce our dataset, and study the use of tax haven subsidiaries by country characteristics. In Section 3, we examine firm characteristics that correlate with the use of tax haven subsidiaries and establish evidence that tax haven subsidiaries are used to save taxes. In Section 4, we establish evidence for the entrenchment motive using the passage of TIEAs. Section 5 concludes.

2. Country-level analysis

In this section, we define and describe tax havens and present country-level measures on the use of tax havens, tax savings, and the cost of rent extraction. We illustrate that firms' use of tax haven subsidiaries is associated with country level measures of benefits and costs of tax avoidance. We introduce our subsidiary data along the way.

2.1 Tax havens

There is no universally agreed upon definition of what a Tax Haven is. A popular and short definition defines a Tax Haven as ‘*a country or territory where certain taxes are levied at a low rate or not at all*’ (Wikipedia). A slightly more elaborated definition is given by Geoffrey Powell (former economic adviser to Jersey): “What ... identifies an area as a tax haven is the existence of a composite *tax structure established deliberately to take advantage of, and exploit, a worldwide demand for opportunities to engage in tax avoidance.*” The key element of Tax Havens for our purpose is thus that they offer income and/or corporate tax rates so low that individuals and/or corporations from abroad are incentivized to engage in tax avoidance (e.g. Dharmapala and Hines 1996).

Lists of countries and territories that constitute Tax Havens are abundant. Table 1 summarizes four such lists and adds an additional list of countries that entered Tax Information Exchange Agreements (TIEA) at some point in time.

--- TABLE 1 ABOUT HERE ---

First, countries and non-sovereign states that have not substantially implemented internationally agreed tax standards constitute the OECD Grey List (see *List 1* in Table 1). Using the Grey List as of August 17, 2009, 34 territories are described as tax haven. These territories are predominantly located in Europe and the Caribbean though some are located in Africa, the Middle East, and the Pacific. Larger independent countries such as Hong Kong and Ireland are not classified as a tax haven though Singapore is. Second, while never enacted, the ‘Stop Tax Haven Abuse Act’ (S.1533) is widely cited as a source of Tax Haven territories. The Act lists 30 territories including Hong Kong and Singapore (see *List 2*). Third, is the original OECD Tax Haven list, which includes 42 territories (see *List 3* in Table 1). Fourth, Hines and Rice (1994) provide a more practical list based on true corporate tax rates rather than official corporate tax rates (see *List 4*). Luxembourg, for instance, has an official corporate tax rate of 29% and does therefore not fall under any of the definitions used to establish the first three Lists. Yet companies can enter private agreements on low taxes (1% and less) and Advanced Tax Agreements with the Luxembourgish tax authorities, making it effectively a tax haven. Fifth, as we use TIEAs for an experiment, we provide a list of all low-tax regimes that entered such agreements according to the OECD (see *OECD Harmful Tax Practices*).

2.2 Subsidiary data and country-level characteristics

In order to investigate how tax havens are used by foreign firms, we construct a novel hand collected dataset for a large set of public listed firms and their national and international subsidiaries. We start from the 2013/2014 volume of Dun and Bradstreet's *Who Owns Whom*; this data set lists public and private ultimate owner firms, subsidiaries held to 50% or more, and subsidiaries of subsidiaries, as well as subsidiaries' headquarter country.⁶ To be able to analyze changes in corporate structures after the introduction of TIEAs we supplement the 2013/14 with 2008/2009 and 1998/1999 data.

Using Dun and Bradstreet's 2013/14 *Who Owns Whom*, we collect information about national and international subsidiaries for 17,331 publicly listed firms from 52 countries. These firms have a total of 231,850 subsidiaries at home and abroad.

It is worth remarking that our data do not distinguish operational subsidiaries from pure tax vehicles. However, setting the number of foreign subsidiaries located in each tax haven in relation to size and area of the tax haven, and comparing these ratios to the USA, it becomes apparent that tax havens harbor relatively many foreign subsidiaries per capita and per square kilometer. We do this in the last six columns of Table 1. In the USA, on average, one can find 1 foreign subsidiary per 307 square kilometers and per 9,946 inhabitants. In the British Virgin Islands and the Cayman Islands, one foreign subsidiary comes with 19 and 50 inhabitants, respectively, and with less than 0.1 square kilometers of land.⁷ Furthermore, we estimate the average number of population and square kilometers per subsidiary in the 37 sovereign and 12 non-sovereign territories classified as tax havens under any of the five definitions from Table 1. Among sovereign Tax Havens, one finds 1 subsidiary per 5,567 inhabitants and per 19 square

⁶ Similarly, Capital IQ and Orbis provide some subsidiary information. However, we compare data on 20 randomly selected firms in Dun&Bradstreet to data in Capital IQ. We find that Capital IQ reports fewer subsidiaries in all cases; the missing subsidiaries tend to be subsidiaries headquartered in smaller countries but these are crucial for our analysis. Additionally, Capital IQ does not provide historical data. While Orbis goes back to 2005, we observe similar coverage issues. Also, some of our later analysis is based on events that occur in the early 2000s and requires pre-2005 data.

⁷ Some narrative examples taken from the data tell the story. For instance, there are 1,759 breweries in the US, roughly 1 per 180,000 inhabitants. There are 3 breweries in the Cayman Islands, roughly 1 per 20,000 inhabitants. SAB Miller Plc (the multinational brewery) alone had 6 subsidiaries in the Cayman Islands in 2013/2014, some of them certainly not breweries.

kilometer. Among smaller non-sovereign Tax Havens, one finds 1 subsidiary per 671 inhabitants and per 2 square kilometers.⁸

Table 2 provides summary statistics by country. Countries are sorted by percentage of publicly listed firms that have at least one subsidiary headquartered in a tax haven as defined by the OECD Grey List (*List 1*).

--- TABLE 2 ABOUT HERE ---

Table 2 reveals that besides Singapore – where 100% of sample firms are classified as Tax Haven Firm (because Singapore is a Tax Haven by the OECD ‘Grey List’) – the use of Tax Haven subsidiaries by public traded firms is most frequent in Switzerland, Norway, Malaysia, and the Netherlands: More than one in five firms headquartered in these countries have at least one tax haven subsidiary. Some countries do not have any firm with tax haven subsidiary, most notably Argentina, Greece, and Russia. Notice, however, that one in six Greek firms make use of tax haven subsidiaries by Lists 2 and 3. 9.7% of US firms use tax haven subsidiaries; fewer Chinese firms (1.2%) use tax haven subsidiaries though this figure increases to 11.6% when using List 4 which includes Hong Kong and Macau. The average country has between 6.9% and 19.6% tax haven firms (by the TIEA List and List 4, respectively). While further analysis of summary statistics will be based on List 1, all results are robust to using other lists.

Table 2 also provides country-level variables for further analysis. *Log (GDP per capita)* is the natural logarithm of GDP per capita in USD in 2013 (Source: World Bank). Two direct measures of the benefits of saving taxes are the *Corporate Tax Rate* and the *Income Tax Rate*. We obtain the maximum brackets in 2013 from government agencies and audit firms. *Tax Evasion* is obtained from the Global Competitiveness Report conducted by the World Economic Forum: Countries’ tax evasion is rated on a scale from 1 (strongly disagree) to 7 (strongly agree) to the statement ‘Tax evasion is minimal’. Arguably, tax evasion is an indirect measure of the benefits of saving taxes or a measure of potential entrenchment.

⁸ A further caveat is that the data source does not provide information on the degree to which firms use their tax haven subsidiaries. Thus, our indicator variable is but a proxy of the use of tax haven subsidiaries.

Entrenchment is hard to measure yet the institutional environment provides an indirect proxy. First, we use *ICRG (Property Rights Protection)* which captures political, economic and financial risk in 2013 and is obtained from the International Country Risk Guide. The measure ranges from 1 to 6 and increases in protection of property rights. Second, *Corruption Level* is based on Transparency International's Corruption Perception Index as of 2013 (Source: Transparency International), an index that measures corruption levels on a scale from 1 (high corruption) to 10 (low corruption).

2.3 The use of tax havens and country characteristics

Figure 1 illustrates correlations between the use of tax haven subsidiaries at the country level and country-level measures variables. The y-axis denotes the percentage of publicly listed firms that have at least one tax haven subsidiary using the OECD 'Grey List' as of August 17, 2009. Hong Kong, Singapore and Ireland are omitted because these jurisdictions constitute tax havens by at least one of the tax haven definitions. The x-axis denotes country level characteristics.

--- FIGURE 1 ABOUT HERE ---

Panel A shows the correlation between use of tax haven subsidiaries and respectively corporate tax rates (left figure) and income tax rates (right figure). While the relation between corporate tax rates of firms' home country and the use of tax haven subsidiaries is merely slightly positive, the use of tax haven subsidiaries is more wide-spread in countries with higher income tax rates. While not causal, this indicates that tax haven subsidiaries may have a higher marginal benefit in high tax environments.

Panel B illustrates the use of tax haven subsidiaries is more prevalent in countries with stronger property rights protection and lower corruption levels. Again, while not causal, it is costlier to divert resources from shareholders in countries with strong property right protection and little corruption. The opaque nature of tax haven subsidiaries facilitates stealing when stealing is costly at home. On the other hand, when corruption is large and shareholder protection is absent, managers do not need a Tax Haven neither to reduce taxes nor to divert resources from shareholders (see evidence from Russia in Desai, Dyck and Zingales 2007 or Mironov 2013).

The left side of Panel C shows that tax haven firms are more wide-spread in countries with low levels of tax evasion. Again if it is easy to avoid taxes in the home country there is less use for a Tax Haven subsidiary to reduce the amount of taxes paid to the government.

The right figure in Panel C of Figure 1 shows that the use of tax havens is more prevalent in countries that are economically more advanced as measured by the natural logarithm of GDP per capita. Thus, our simple correlations with country variables maybe be flawed by not controlling for economic development. We address this concern in Appendix 1 by running a logit regression where the dependent variable is the percentage of firms that use tax haven subsidiaries. In addition to the country characteristics discussed above, we control for economic development. We find that the use of tax havens correlates with tax rates, protection of property rights, low corruption levels, and low tax evasion after controlling for economic development. Moreover, protection of property rights and low corruption levels are robust to additionally controlling for overall taxes.

A related concern is that our correlations are driven by outliers – such as countries with few observations in our dataset. Panel B of Appendix 1 confirms our results weighing observations by the number of sample firms.

Overall, Figure 1 supported by the Appendix provides indication that there is a correlation between the use of tax havens and corporations' ability to implement an aggressive tax policy in their home country. Beyond the pure tax saving motive, Figure 1 Panel A and B also provide the first indication that the ability to transfer resources away from shareholders may play an additional role in the decision to establish subsidiaries in Tax Havens. In later part of this paper there will be a strong focus on establishing a causal link between the use of tax haven and managerial actions that goes beyond the pure tax saving interest of minority shareholders. However, before we do that we will introduce firm level data.

3. Firm-level analysis

In this section, we study the relation between the use of tax havens and firm characteristics. We describe firm level data, and provide a univariate and multivariate description of the data. The aim is to gain a better understanding of the data by examining correlations. Furthermore we

provide causal evidence of the importance of home country tax rates on the valuation of firm with tax haven subsidies.

3.1 Univariate analysis

We enrich the subsidiary data described in the previous section by firm-level accounting data and data on trademarks and patents from Orbis/Osiris. Following Demsetz and Lehn (1985) and Morck, Shleifer and Vishny (1988), we use Tobin's Q to measure firm value. *Tobin's Q* is obtained from Osiris as $(\text{Enterprise Value} + \text{Total Liabilities}) / (\text{Total Shareholder Equity (Book Value)} + \text{Total Liabilities})$. We restrict the sample to those 10,513 publicly listed firms for which we can construct Tobin's Q . All control variables are constructed as described in Table 3 and winsorized at 1st and 99th percentile though our results are robust to other specifications.

Summary statistics are presented in Table 3. All accounting measures are constructed at the firm-year level and then summarized by firm over the 2004-2013 period to obtain one observation per firm.⁹ Panel A shows number of observations and mean values for each variable and splits firms into firms with and without tax haven subsidiary. While we use the definition of the OECD Grey List, our results are robust to using any other list. Panel B focuses on the subset of firms with at least one foreign subsidiary. Panels C and D provide the results of multivariate probit regressions with country and industry fixed effects.

--- TABLE 3 ABOUT HERE ---

Roughly one in six sample firms (17.23%) have at least one tax haven subsidiary. Firms with tax haven subsidiary tend to be larger, are older, grow more slowly, but are more profitable (measured by profit margin and ROA). Overall, they have a lower Tobin's Q .

Moreover, tax haven firms are 2.2%pts more highly levered. The marginal benefit of saving taxes through tax haven subsidiaries may be larger for highly levered firms, given that additional leverage may come with substantial additional costs of distress. Graham and Tucker (2006) document that tax sheltering is associated with a decrease in leverage yet their 44 sample observations are matched. Table 3, however, provides univariate splits without matching for firm

⁹ Our univariate split and multivariate results are robust to using 2013 data (where sales growth is constructed from 2012-2013 data).

characteristics. Firms with tax haven subsidiary also face higher effective tax rates: Again, this does most likely not mean that tax haven subsidiaries increase effective tax rate; much rather, it could indicate that some firms are unable to reduce taxes at home, increasing the benefits from using tax haven subsidiaries. Interestingly, firms with tax haven subsidiary hold less cash though this result is turned around in the multivariate setting. Moreover, tax haven firms pay higher dividends though this might be correlated with size, age, and leverage.

In line with the idea that it is easier to transfer revenues through intangible assets such as patents registered in low tax countries, tax haven firms are firms with higher fraction of intangible assets, patents, and trademarks, and are more likely to have trademarks or patents.

Panel B repeats the previous analysis on firms with at least one foreign subsidiary and confirms most of the univariate results above. Additionally, Panel B introduces a measure of the cost of repatriating foreign revenue. Many jurisdictions (such as the US) impose repatriation taxes on revenues shifted from abroad to the home country; such repatriation taxes typically increase in the difference between (low) taxes paid abroad and (high) taxes paid at home. We document that tax haven firms are firms that face much lower average taxes abroad than non-tax haven firms; also, their average foreign taxes are much lower than their home taxes.

3.2 Multivariate analysis

In order to more formally study the use of tax haven subsidiaries, we employ firm-level probit regressions with industry and country fixed effects and control for various firm characteristics in Panels C and D of Table 3. The dependent variable is an indicator variable equal to one if a firm has at least one subsidiary headquartered in a tax haven on the OECD Grey List.

Adding country and industry fixed effects does not change the correlation between using a tax haven subsidiary and size, return on assets, effective tax rate, leverage, being a dividend payer, and cash documented in the univariate analysis. Controlling for all of these at once, the results for size, leverage, and being a dividend payer survive, while having more cash over assets becomes positively associated with having a tax haven subsidiary. Adding the difference between taxes paid abroad and taxes paid at home as an additional control provides further evidence on the repatriation argument discussed above.

Panel D further investigates whether the transferability of assets, measured by intangible assets, R&D, and the use of patents and trademarks, explains the use of tax havens. Indeed, after controlling for all of the factors outlined in Panel C, firms with assets that allow for easier transfer of revenues are more likely to have tax haven subsidiaries. Appendix 2 further splits our sample into US and non-US firms: all previous results are by and large confirmed.

Overall, this section provides correlations between firm characteristics and the use of tax haven subsidiaries. While these correlations confirm the tax savings motive, this analysis also highlights that tax haven firms are different, suggesting the importance of matching by firm characteristics in later analysis.

3.3 Causal relationship between changes in corporate tax rates and firm value of firms with tax haven subsidiary

We argue that saving taxes is a key motive for establishing Tax Haven subsidiaries. Relevant to this motive, we have so far documented that the use of tax havens correlates with country-level tax rates and that firms with tax haven subsidiary are firms that face relatively low taxes abroad which means that they face higher repatriation taxes.

In this section, we exploit changes in corporate tax rates to provide causal evidence on the tax savings motive and firm value. Over the period 2008-2013, some countries reduced their maximum corporate tax bracket. All else equal, a reduction in corporate taxes increases firm value. However, we predict that firms that avoid home taxes through tax haven subsidiaries should be unaffected or less positively affected by a reduction in corporate taxes at home.

Illustratively, Figure 2 plots changes in corporate tax rates between 2008 and 2013 against changes in firm value and changes in the use of tax haven subsidiaries, respectively. Changes in the corporate tax rate are obtained from KPMG' *Corporate and indirect Tax Rate Survey 2014*; a negative value denotes a reduction in corporate tax rates over the five year period. On the left, the y-axis denotes changes in the difference in Tobin's Q from 2008 to 2013 for a balanced panel of roughly 4,000 firms that we could track over that time period. Specifically, firms are identified as tax haven firms in 2008. We then take the difference between Tobin's Q of firms with tax haven subsidiaries in 2008 and firms without tax haven subsidiaries in 2008 and deduct it from

the respective difference in Tobin's Q in 2013. A negative value denotes that firms with tax haven subsidiary have become relatively less valuable over the five year period. In line with our prediction, we find that the difference in firm value between tax haven and non-tax haven firms becomes more negative in countries that reduce corporate tax rates more substantially: Tax reductions benefit firms but less so when firms use tax havens.¹⁰

--- Figure 2 ABOUT HERE ---

In order to test this more formally at the firm level, Table 4 investigates the effect of changes in the corporate tax rate on firm value in a panel of publicly listed firms from 2008 to 2013. The left hand side is *Tobin's Q*. The key control variable is *Change in Tax Rate*, the percentage change in corporate tax rates over the previous year. *Tax Haven Subsidiary* is an indicator variable equal to one if a firm has at least one subsidiary in a tax haven (as defined by the OECD 'Grey List'). Columns (1) and (2) use the full sample while Columns (3) and (4) use a sample of firms with tax haven subsidiary and control firms matched by industry, headquarter country, the natural logarithm of assets, and the natural logarithm of firms' age (measured by years since foundation). All regressions control for the natural logarithm of assets, the natural logarithm of assets squared, firm fixed effects, and time fixed effects. Standard errors are clustered at the country and year level (2-way clustering).¹¹

--- TABLE 4 ABOUT HERE ---

Indeed, while a reduction in corporate tax rates leads to an increase in firm value, this result only holds for the subset of firms that do not have tax haven subsidiaries.¹² In the matched sample, a 1 percentage point decrease in the corporate tax rate is associated with a 1.2% increase in the value of firms without tax haven subsidiary but no increase in the value of tax haven firms.

When faced with a reduction in corporate tax rates, the marginal benefit of having a tax haven subsidiary may decrease. In the right Panel of Figure 2, the y-axis denotes the difference between

¹⁰ We restrict our sample to countries in which we can track at least 5 firms with accounting data from 2008 to 2013.

¹¹ Our results are robust to other specifications, such as omitting controls from the matched regressions and clustering along other dimensions.

¹² The sample of tax changes is a sample abundant of tax reductions. A negative *Change in Tax Rate* coefficient indicates that an increase in the tax rate leads to a reduction in firm value. Yet knowing that the sample contains by and large tax reductions, we chose to interpret the coefficients in that way. All results are robust to removing countries that did not change their corporate tax rate.

the percentage of firms with tax haven subsidiaries in 2013 and the percentage of firms with tax haven subsidiaries in 2008. We focus on firms that we can track from 2008 to 2013 though we do not require that accounting data is available. A positive value means that the fraction of firms with tax haven subsidiary has increased over the five year period. Somewhat in line with the idea that tax haven subsidiaries become more valuable when corporate tax rates are relatively higher, the percentage of firms with tax haven subsidiary increases less over the 5 year sample period in countries that reduce corporate tax rates.

In sum, this section has shown that the tax saving motive is important component in understanding why public traded firms establish tax haven subsidiaries.

4. Entrenchment Motive: Evidence from Tax Information Exchange Agreements

In this section we analyze to what extent entrenchment is an additional component to explaining the use of tax haven subsidiaries – beyond the tax saving motive documented above. To do this, we focus on the effect of tax information exchange agreements (TIEAs) on shareholder value.

4.1 Tax Information Exchange Agreements and identification strategy

TIEAs are bilateral agreements between territories aimed at promoting the exchange of tax-relevant information in civil and criminal tax investigations. Regarding firms, such tax-relevant information comprises bank details and ownership details of companies, funds, and trusts. Similarly, TIEAs allow for the exchange of tax information on individuals' accounts.

TIEAs improve tax authorities' ability to enforce tax laws – with civil and criminal consequences for firms and individuals. They increase the expected detection cost associated with tax evasion and aggressive tax avoidance through increasing the probability of detection. It is important to emphasize that TIEAs do not change tax laws in any or the countries signing the agreement. Thus, if firms' tax policy follows the rules in both signatory countries, TIEAs do not require any change in firms' tax policy.¹³

¹³ See e.g. oecd.org/tax/exchange-of-tax-information/taxinformationexchangeagreementstieas.htm and hmrc.gov.uk/taxtreaties/tiea.htm for more information.

Since 2000, over 500 TIEAs have been signed (see Panel A of Figure 3). While most of these agreements have been signed after 2008, the number of treated firms in our sample increased substantially in 2001 and 2002, as well as in the years following 2008. This time series variation in the passage of agreements is important for our identification strategy as it rules out alternative explanations such as the financial crisis that may affect tax haven firms differentially.

--- FIGURE 3 ABOUT HERE ---

As we are interested in implications of tax enforcement for publicly listed firms, we focus on the TIEAs that involve at least one sovereign non tax haven territory.¹⁴ Some countries are not among the signatory countries, e.g. Brazil and Russia. These countries would provide some interesting cross-country predictions: In Russia, for instance, tax avoidance or tax fraud do not require complex tax haven constructs but can be achieved through outright theft (Desai et al. 2007, Mironov 2013). Thus, a TIEA signed by Russia might have no impact on Russian tax haven firms. We speculate that this may be one reason for why Russia has not yet signed any TIEAs. Appendix 3 lists TIEAs involving exactly one tax haven country (or non-sovereign nation) and one non-tax haven country (Source: OECD *Harmful Tax Practices*) and affecting at least one sample firm. Listed are 362 agreements between non-tax haven signatories (Panel A) and tax haven signatories (Panel B)¹⁵. Some sample firms may be affected by more than one TIEA yet we focus on the first treatment.

As we discussed in the introduction, TIEAs provide us with a powerful natural experiment to separate the entrenchment motive from the tax saving motives. A TIEA will weakly increase the cost of aggressive tax behaviour which should have a zero or negative impact on shareholder value. On the other hand, a TIEA may make it more costly for managers to engage in entrenchment activities. There are a number of reasons for this: First, if managers or owners transfer money illegally to third party firms owned by themselves, friends, or straw men, a TIEA increases the likelihood that these transfers are detected by the tax authorities and owners of the firm. Thus, a TIEA may increase the likelihood of criminal charges against entrenched managers or owners. Second, if complex firm structures are used by managers to pile up cash (see e.g.

¹⁴ At least on third of TIEAs are between two tax havens or between tax havens and economically small non-sovereign territories such as between the Faroe Islands and Greenland.

¹⁵ Roughly one third of the more than 500 TIEAs were signed between tax havens or between tax havens and non-sovereign territories: We do not list these agreements in Appendix 3.

Hanlon et al. 2014 for evidence that havens are used to pile cash that is used for inefficient acquisitions), a TIEA may increase the likelihood that owners detect that managers are withholding money that could be paid out to shareholders (at the potential cost of repatriation taxes). More information may induce owners to fire managers pursuing their own interest even if activities are legal in both home country and Tax Haven. If managers or controlling owners use complex subsidiary structures in Tax Havens to pursue their own interests, a TIEA will reduce entrenchment activities which increases shareholder value.

We estimate the effect of tax enforcement on firm value using a difference-in-difference approach that follows Bertrand and Mullainathan (2003). Specifically, we estimate

$$y_{it} = \alpha_i + \alpha_t + \beta_1 TREATED_{it} + \mathbf{X}_{it} + \varepsilon_{it} \quad (1)$$

where i denotes firms, t denotes time, y_{it} is the dependent variable of interest (e.g. Tobin's Q), α_i and α_t are firm and year fixed effects, $TREATED_{it}$ is a dummy that equals one if a firm has been affected by a Tax Information Exchange Agreement signed between its headquarter country and a tax haven in which that firm has a subsidiary, \mathbf{X}_{it} is a vector of controls, and ε_{it} is an error term. Besides year and firm fixed effects, controls comprise size, age, and size squared. Because treatment is staggered over time (see Figure 3), alternative events affecting treated firms at the same time – such as the financial crisis – are less likely to drive our results. Standard errors are clustered at the country and year level (2-way clustering) though results are robust to alternative specifications.

Figure 4 illustrates our identification strategy. Firms 1 through to 4 are headquartered in Headquarter Country 1 (HQ Country 1). Firms A through to D are headquartered in Headquarter Country 2 (HQ Country 2). These firms have subsidiaries at home and in two tax havens (TH 1 and TH 2). In Panel A, at time t , HQ Country 1 and Tax Haven 2 enter a Tax Information Exchange Agreement (TIEA) and Firms 3 and 4 become treated while all remaining firms in both countries act as control firms. In Panel B, at some later point in time $t+s$, HQ Country 2 and Tax Haven 1 also enter a TIEA which means that (besides Firms 3 and 4) Firms A and C become treated while Firms 1, 2, B, and D are control firms. In robustness tests, one treated firm is

matched to one control firm that is headquartered in the same country, operates in the same industry, and is similar in age and size. This match is based on data 5 years prior to treatment.

--- FIGURE 4 HERE ---

In a variation, we run (1) on treated firms and matched control firms and additionally include post-treatment dummies for control firms. In a further variation of (1) above, y_{it} denotes daily returns. Accordingly, $TREATED_{it}$ denotes days around the signing to TIEAs.¹⁶

The implementations of TIEAs is a particularly useful setting to study entrenchment motives in Tax Haven activities for at least three reasons. First, the signing of TIEAs is a bilateral action resulting from a political process that is generally exogenous to those firm level variables important for this study. Additionally, in Appendix 4, we confirm that the passage of TIEAs between country pairs is not easily explained by economic links between non-haven countries and tax havens. We run logit regressions explaining the passage of TIEAs between pairs of tax haven territories and non-tax haven countries. The left hand side variable is a Dummy variable equal to one if a pair of non-haven country (as listed in Table 2) and tax haven territory (as listed in Table 1) has passed a TIEA by 2013 and zero otherwise. The key right hand side control is the economic link between respective pairs. In Columns (1), (3) and (5), economic links are measured by the sum of the number of subsidiaries of public and private firms from Country 1 in Country 2 and the number of subsidiaries of public and private firms from Country 2 in Country 1. In Columns (2), (4) and (6), economic ties are measured by the maximum of the number of subsidiaries of public and private firms from Country 1 in Country 2 and the number of subsidiaries of public and private firms from Country 2 in Country 1, accounting for the fact that the passage of a TIEA may be driven by the stronger partner. Columns (7) to (8) repeat the analysis using the number of subsidiaries of publicly listed firms between country pairs. We include fixed effects for non-tax haven countries (Columns (1) and (2)), tax haven territories (Columns (3) and (4)), and both (Columns (5)-(8)). Economic links do not significantly explain the passage of TIEAs, alleviating the concern that TIEAs are explained by economic links.

¹⁶ In that variation, rather than including firm and day fixed effects, we demean the dependent variable by firm and include day fixed effects.

Second, even if the passage of TIEAs is not explained by economic links, the passage may be driven by general changes in the regulatory environment in firms' home country, i.e. by time trends. For instance, the passage of TIEAs may be part of regulatory efforts to increase tax enforcement. Our *difference-in-difference* methodology takes such potentially omitted variables into account by comparing treated firms to control firms headquartered in the same country. Especially when we match treated firms to firms headquartered in the same country, we are able to compare treated and control firms before and after the passage of TIEAs.

Third, some concerns about the exogeneity of the passage of TIEAs remain when considering other unobservable or non-measurable determinants of the passage of TIEAs. For instance, the signing of a TIEA may be driven by the fact that public firms headquartered in one signatory country use specific Tax Havens for very aggressive tax avoidance. For instance, the US regulator may be aware that US firms use their Cayman Island subsidiaries for very aggressive tax avoidance and therefore decide to sign an agreement. However, we argue that such considerations typically work against us finding a positive effect of TIEAs on firm value: If investors could predict country-tax haven pairs that enter TIEAs, the effect of TIEAs would be priced before the signing is announced. Additionally, the illustrative consideration outlined above would suggest that the signing of a TIEA between the US and the Cayman Islands increases the cost of using the Cayman Islands to reduce corporate taxes. All else equal, this cost would destroy some of the value potentially created by TIEAs.

4.2 The impact of TIEA on firm value.

In Table 5 Panel A, we study the effect of TIEAs on firm value using OLS regressions for a panel of firms from 1996 to 2013 following Equation (1). Column (1) uses the full sample of firms. In columns (2) and (3), one non-treated (control) firm is matched to each treated firms five years prior to the year a TIEA is signed. In columns (4) and (5), 10 firms are matched to treated firms. Firms are matched by country, industry, log of assets, and log of age with replacement.

--- TABLE 5 ABOUT HERE ---

We find that the passage of TIEAs does indeed lead to an increase in firm value. In the full sample, Tobin's Q increases by 2.5% after treatment. The effect is still significant and similar in

magnitude for samples of 1 control firm (2.6%) and 10 control firms (2.3%). In Column (1), the counterfactual constitutes all non-treated firms as well as treated firms prior to the passage of a TIEA. In Columns (2) and (4), treated firms before the passage and control firms from the same headquarter country both before and after the passage of TIEAs act as control group. In Columns (3) and (5), we add a dummy for non-treated firms after the TIEA. This allows us to rule out that headquarter country-specific shocks that correlate with the passage of TIEAs – such as changes in tax enforcement – explain our results. The coefficient on control firms after the passage of TIEAs is very close to zero and statistically insignificant, suggesting that no such shocks are at play. We conclude that TIEAs only affect treated firms and that this result is not driven by country-specific characteristics.

Of course, one immediate concern is that we capture a time trend: Firms with subsidiary in treated havens may become more valuable year after year’ our crude before- and after-dummies pick up that time trend. We therefore analyze firm value year by year around the passage of TIEAs. Figure 5 plots the evolution of firm value of treated firms around the passage of TIEAs. The x-axis denotes years around the passage of TIEAs. The y-axis shows the coefficient from an interaction between year-to-event dummies and a treatment indicator variable. The increase in firm value occurs abruptly between year -1 and year +1 around the treatment date, alleviating the concern.

--- FIGURE 5 ABOUT HERE ---

To further alleviate the concern of time trends, we study daily abnormal returns around the signing of TIEAs. Such event study using daily data also reduces the concern that an annual measure such as Tobin’s Q captures some policy changes that occur on an annual basis, as well as the concern that Tobin’s Q may increase mechanically due to some change in accounting practices associated with the passage of TIEAs.

While it is impossible to nail down precisely the first announcement of most TIEAs by the press, anecdotal evidence suggests that TIEAs are not discussed in public long before they are signed. Indeed, when we randomly select 10 TIEAs and search for their first mentioning in Factiva, we find that four of these ten agreements are not mentioned in the press. Three agreements are mentioned in the five days preceding the signature date, one on the signature day,

and two during the 5 days after the signature date. Figure 6 shows cumulative returns around the passage of TIEAs and re-confirms the positive effect on affected firms' value, alleviating concerns about Tobin's Q.

--- FIGURE 6 ABOUT HERE ---

The magnitudes in Figure 6 have to be interpreted with caution. First, raw returns also reflect risk (indeed, tax haven firms tend to have a higher beta). Second, TIEAs may have been signed during bull markets on average. In order to control for risk and general market movement, we study daily returns and abnormal returns in a multivariate framework (see Table 5 Panel B). We include firm and day fixed effects and cluster by firm and day to allow for correlation across firms on the same day as well as correlation across days within the same firm. We study a range of event windows around the signature date to account for the fact that TIEAs may be announced shortly before or after the signature day. We confirm our previous results: Firms affected by TIEAs have positive daily returns around the signature date, also after controlling for market risk. The magnitude of the effect is similar to that of the Tobin's Q regressions once we control for market risk.

In sum, we show in this subsection that a positive shock to regulators' ability to monitor subsidiaries in tax havens increases the value of firms with tax haven subsidiaries.

4.3 Evidence for entrenchment

In this subsection, we investigate channels of the firm value effect documented above. Specifically, TIEAs may increase firm value because they facilitate monitoring, thereby reduce managerial slack or outright stealing. We study whether TIEAs have a larger effect on firms with larger exposure to tax havens, whether firms actively avoid TIEAs by shifting operations to other tax havens, and whether TIEAs lead to operational gains.

4.3.1 TIEAs and complexity of firms' structure within tax havens

Operating tax haven subsidiaries comes with complexity. However, we argue that complex organizational structures in Tax Havens are more useful to hide entrenchment activities than to pursue (legal) tax saving activities. A common way to pursue aggressive tax planning is to

transfer material or immaterial assets – such as patents or trademarks – to a Tax Haven subsidiary and then charge the mother company for the use of these assets. This requires one subsidiary in a Tax Haven – adding additional subsidiaries does not further improve the ability to save taxes. Hiding other activities from shareholders and other monitors, however, benefits from a complex structure with many tax haven subsidiaries. Complexity may be discounted by shareholders because complexity facilitates entrenchment or because complexity increases uncertainty about operations. We discuss the reduction in uncertainty below and focus on entrenchment for now.

In Table 6, we first document that tax haven firms tend to be more complex even after controlling for other characteristics such as size. We provide a range of measures of complexity, including the number of subsidiaries and the number of hierarchical levels. Indeed, Panel A shows that firms with tax haven subsidiary have significantly more subsidiaries and have a significantly more complex subsidiary structure measured by the number of hierarchical levels; this still holds after controlling for country and industry fixed effects and various firm characteristics including size (Panel B).

--- Table 6 ABOUT HERE ---

We then link firms' complexity within the tax haven to the magnitude of the treatment effect (Panel C). As discussed above, a complex structure within a given tax haven may makes it harder for minority investors and outsiders to monitor and control the actions pursued by insiders, including managers and controlling owners. We study two measures of firms' complexity within tax havens. The first is the logarithm of the number of subsidiaries in tax havens. The second is the share of subsidiaries that are headquartered in tax havens. Interacting treatment with complexity within a given tax haven, we find that TIEAs have a significantly more positive effect for both measures. The effect is robust to matching treated firms to control firms.

We conclude that firms with more complex firm structures in tax havens are rewarded more by investors when affected by a TIEA. This finding is hard to explain by a pure tax saving motive and therefore, Table 6 provides additional evidence that tax haven activities are driven by entrenchment activities that go beyond pure tax saving.

4.3.2 Haven hopping

One alternative response to TIEAs is to engage in *haven hopping*: Managers might strategically close tax haven subsidiaries in treated tax havens and open new tax haven subsidiaries in unaffected tax havens.

We investigate this possibility in Table 7. Panel A follows firms through the first wave of TIEAs from 1998 to 2008 and the second wave from 2008 to 2013, respectively. We categorize firms as having no tax haven subsidiary, having a tax haven subsidiary in at least one subsequently affected tax haven, and having tax haven subsidiaries but exclusively in non-affected tax havens at the beginning of the sample period. We then establish whether firms change categories over the sample period.

--- Table 7 ABOUT HERE ---

Most importantly, one third of firms that have a subsidiary in a subsequently affected haven at the beginning of the sample period close that subsidiary and move exclusively to non-affected tax havens (33% from 1998 to 2008 and 31% from 2008 to 2013). At the same time, only 10% and 7% of firms with tax haven subsidiary move into affected tax havens from 1998 to 2008 and from 2008 to 2013, respectively. Moreover, most firms that do not have tax haven subsidiaries at the beginning of our sample period do not move into tax havens; however, among those firms that do open such subsidiaries, most open them in unaffected tax havens.

If such strategic haven hopping was sought by managers to continue entrenchment (and if shareholders value such activity accordingly as well as predict haven hopping to some extent), the value of firms that engage in haven hopping should be less responsive to the passage of TIEAs. While it is hard to obtain announcement dates of firms' decisions to engage in different tax havens, Panel B investigates whether the change in treated firms' value is partly explained by haven hopping. We follow our main specification (Table 5) but additionally interact treated firms with a Dummy that equals one if a firm engages in haven hopping. While statistically just around the 10% level, we find that treated firms that engage in haven hopping are less positively affected by the passage of TIEAs than firms that do not engage in haven hopping. Thus, the

positive impact of TIEAs on average shareholder value is driven by companies that do not engage in heaven hopping.

Taken together, this constitutes strong evidence that some firms strategically avoid tax havens entering TIEAs. The fact that such strategic moves are not associated with an increase in firm value is consistent with the notion that tax havens may be used for entrenchment.

4.3.3 Operational effects of TIEAs.

We conclude this section by investigating whether there are operational explanations for our main result that TIEAs have a positive effect on shareholder value. For instance, one could think that TIEAs improve monitoring which in turn reduces managerial slack.

Table 8 follows the methodology outlined in Equation (1) but tests for the effect of TIEAs on profit margin and gross margin. Moreover, we test for further drivers of Tobin's Q – specifically, we analyze the effective tax rate and risk (measured by beta), as well as leverage.

--- Table 8 ABOUT HERE ---

Overall, our results indicate that treated firms do not increase their profit margin or gross margin. While the gross margin does go up (at 10% significance level), this result does not hold when matching treated firms to control firms.

TIEAs might have an indirect on effective tax rates either because firms reduce activity in the grey area between legal and illegal tax avoidance or because home country tax authorities use TIEAs to adjust the home country tax base; however, both these channels would predict a decrease in Tobin's Q. Our analysis suggests that effective tax rates are unaffected by TIEAs.

Part of the increase in firm value may stem from a reduction in investors' uncertainty. While the discount rate applied by investors is hard to measure, one of its components is firms' exposure to the market. We find no significant effect of TIEAs on firms' beta.

Finally, if tax haven operations were a substitute tax savings mechanism to leverage, firms might respond to TIEAs by leveraging up. Of course, this would only happen if TIEAs had an impact on effective tax rates – and the impact of increased leverage on firm value would be

negative due to an increase in expected bankruptcy costs. We do not observe an increase in leverage after the passage of TIEAs.

This subsection provides evidence that the increase in firm value associated with the passage of TIEAs is not driven by operational efficiency gains.

4.5 Cross-sectional results

Having established that the use of tax haven subsidiaries is partly driven by entrenchment, we now turn our attention to characteristics of firms that benefit more from the passage of TIEAs. In Table 9, we re-run our main specification and interact treatment with a range of cross sectional firm characteristics.

--- Table 9 ABOUT HERE ---

First, we focus on intangible assets in Panel A. We established above that firms with intangible assets are more likely to use tax haven subsidiaries (Table 3 Panel D). Arguably, these firms benefit from the fact that they do not have to shift physical assets to tax havens in order to claim lower tax rates. Of course, while these firms may find it less costly to save taxes by shifting revenues, the unobservable nature of assets being shifted also makes such activities harder to observe. The passage of TIEAs does not challenge tax savings; however, it challenges potential entrenchment involved in shifting revenues from intangible assets into tax havens. Indeed, we document that firms with patents and trademarks – measured by numbers and indicator variables – are more positively affected by the passage of TIEAs.

Second, some firms are less monitored prior to the passage of TIEAs; outside shareholders of such firms may benefit even more from additional monitoring imposed by the passage of TIEAs. Indeed, we document that our result is driven by firms with lower institutional ownership. This goes in line with the notion that institutional investors, to some extent, act as monitors. Confirming this notion, we find that firms that are less levered and more fast-growing (measured by cash flow growth) are more positively affected by the passage of TIEAs (Panel B). This goes in line with the view of leverage as a monitoring device and with anecdotal evidence that internal control systems do not catch up in fast-growing firms.

5. Conclusion

Tax haven subsidiaries can be used to reduce corporate taxes and to shield cash from outsiders such as minority shareholders. Consistent with the tax motive, we find that a 1 percentage point reduction in home-country corporate tax rates is associated with a 1.2% increase in value of firms without tax haven subsidiary while firms with tax haven subsidiary are unaffected. Consistent with the entrenchment motive, we document that the passage of TIEAs between countries and tax havens increases average shareholder value by 2.5%. While outright theft is hard to observe, this increase in firm value is unlikely driven by a reduction in managerial slack or by a reduction in uncertainty as indicated by our results on operational efficiency and beta. Suggesting entrenchment, the documented positive effect of TIEAs on firm value is more pronounced in firms with strong exposure to tax havens and not present among firms that avoid TIEAs by engaging in *haven hopping*. Last but not least, firms that are more likely to suffer from agency problems – such as weakly governed firms – are more positively affected by the passage of TIEAs. In sum, we establish that investors endorse regulatory initiatives that have the potential of illuminating corporate activities in Tax Havens.

The amount of cash held offshore by multinational corporations has grown significantly over the past years, reaching tens of trillions of US dollars. Our paper provides new insights into drivers of corporate decisions to move activities to Tax Havens. Our paper also provides relevant implications to policy makers. Specifically, the OECD's fight against offshore tax havens benefits shareholders. From this perspective, our results provide support to plans to further extend the current set of TIEAs to incorporate as many countries and tax havens as possible.

Table 1: Tax haven list

This table lists countries and non-sovereign nations that are classified as tax havens by at least one of five sources: First, by the OECD ‘Grey List’ (*List 1*; as of August 17, 2009). Second, by the ‘Stop Tax Haven Abuse Act’ (*List 2*; S.1533; not enacted). Third, by the original OECD Tax Haven List (*List 3*). Fourth, by Hines and Rice (1994) (*List 4*). Fifth, by entering a Tax Information Exchange Agreement (*TIEA*; OECD Harmful Tax Practices). *Sovereign* is a Dummy variable equal to one if a tax haven is a sovereign state and zero otherwise. *Population (in 000s)* denotes the population in 2013 (World Factbook). *Area (km²)* denotes the land area in square kilometers (World Factbook). *Pop Dens (ppl/km²)* is the population divided by area (km²). *#Foreign Subs* is the number of subsidiaries of public and private firms headquartered in the respective territory in 2013 but ultimately owned by a foreign parent firm (Dun & Bradstreet’s *Who Owns Whom 2013/2014*). Subsidiaries are defined as companies owned by at least 50%. *Pop/ForSub* and *km²/ForSub* denote the population and square kilometers per foreign subsidiary, respectively. While previous editions of *Who Owns Whom* listed a few British territories (the Channel Islands and the Isle of Man) and US territories (the US Virgin Islands) as separate headquarter countries, the most recent 2013/2014 version lists such subsidiaries as headquartered in the UK and in the US, respectively.

Table 2: Country level summary statistics and the use of tax haven subsidiaries around the world

This table provides country-level summary statistics. The sample consists of 52 countries for which at least one publicly listed firm with non-missing industry affiliation in Datastream/Worldscope could be matched to Dun & Bradstreet's *Who Owns Whom 2013/2014*. Countries are sorted by the % of public firms that have at least one subsidiary headquartered in a tax haven. Tax havens are countries or non-sovereign nations that appear on the OECD 'Grey List' as of August 17, 2009 (this percentage is 100% for Singapore as Singapore is a Tax Haven by that list). # *Parent Firms* denotes the number of publicly listed firms headquartered in the respective country. # *Subsidiary Firms* denotes the number of subsidiaries owned to 50% or more by the parent firms. *List 1* through to *List 4* and *TIEA* denote the % of parent firms that have at least one subsidiary in a tax haven where tax havens are countries or non-sovereign states on respective lists (see Table 1); this percentage is 100% if the country is defined as a tax haven by the respective list. *Log (GDP per capita)* is the natural logarithm, of GDP per capita in USD in 2013 (Source: World Bank). *Corporate Tax Rate* is the maximum corporate tax rate bracket and *Income Tax Rate* is the maximum income tax bracket in 2013, listed by Wikipedia and obtained through various sources (largely government agencies and audit firms). *Tax Evasion* is obtained from the Global Competitiveness Report conducted by the World Economic Forum: Countries' tax evasion is rated on a scale from 1 (strongly disagree) to 7 (strongly agree) to the statement 'Tax evasion is minimal.'. *ICRG (Property Rights Protection)* captures political, economic and financial risk in 2013 and is obtained from the International Country Risk Guide; the measure ranges from 1 to 6 and increases in protection. *Corruption Level* is based on Transparency International's Corruption Perception Index as of 2013 (Source: Transparency International), an index that measures corruption levels on a scale from 1 (high corruption) to 10 (low corruption).

Country	# Parent Firms	# Subsidiary Firms	% of Firms with Tax Haven Subsidiary (100% if country is TH by respective list)					Log (GDP per capita)	Corporate Tax Rate	Income Tax Rate	Tax Evasion	ICRG	Corruption Index

Table 3: Firm Level Summary Statistics

This table presents firm-level summary statistics and characteristics of firms with tax haven subsidiary in 2013. Panels A and B report the number of sample firms, the mean, the mean if such firm has at least one tax haven subsidiary or no tax haven subsidiary (using the OECD 'Grey List' to identify tax haven countries; see Table 1), and the difference in means with significance at 1%, 5% and 10% denoted by ***, **, and *, respectively. *TH Subsidiary (Dummy)* is a dummy variable equal to one if a firm has a tax haven subsidiary in 2013. *TH Subsidiary w/Acc Info* is constructed in the same way but restricted to firms with non-missing total assets and non-missing data required to construct Tobin's Q. Means of accounting variables are constructed from one observation per firm; firm-level observations are obtained from data going back up to 10 years. *Tobin's Q* is obtained from Osiris as (Total Equity+Total Liabilities)/(Total Shareholder Equity (Book Value) + Total Liabilities). *Sales Growth* is the average year-by-year growth in sales. *ROA(%)* is Profit & Loss before Tax / Total Assets in %. *Cash Flows over Sales* is Operating Cash Flow over Total Sales in %. *Profit Margin* and *Gross Margin* are Profit&Loss before Tax and Gross Profit over Operating Revenue, respectively. *Effective Tax Rate* is Income Taxes / Earnings before Interest, Tax, Depreciation and Amortization in %. *Leverage* is Total Liabilities and Debt / Total Assets. *Dividend Payer Dummy* is a Dummy equal to 1 if a firm pays a non-zero dividend. *Dividend Payout* is the fraction of income paid out in dividends, assuming that firms with missing dividend information do not pay a dividend. *Intangible Assets* and *R&D* are intangible assets and R&D as a fraction of total assets. *# Trademarks* and *# Patents* denote the number of registered trademarks and patents in 2013. *ID Trademark* and *ID Patent* are dummy variables equal to one if a firm has a trademark and patent, respectively. *ln(Assets)* is the natural logarithm of total assets; age is time between foundation and 2013. *Mean Foreign Tax* is the average maximum corporate tax rate faced by foreign subsidiaries weighing each subsidiary equally. *Dif(Foreign-Home Tax)* is the *Mean Foreign Tax* less the maximum tax rate at home. Accounting data and trademarks & patent data are obtained from Osiris and Orbis. Tax data is obtained from various sources including government agencies and KPMG Audit. Panels C and D show the results of firm-level probit regressions on the subset of firms headquartered in countries that contain at least one firm with tax haven subsidiary and one firm without tax haven subsidiary. The dependent variable *TH Sub* is an indicator variable equal to one if a firm has at least one subsidiary headquartered in a tax haven where tax havens are countries or non-sovereign nations on the OECD 'Grey List'. Panels C and D include industry fixed effects and country fixed effects. T-statistics for tests of significance based on robust standard errors are reported below coefficients. ***, ** and * indicate significance at the 1%, 5% and 10% level.

Table 4: Corporate Tax Rates and Firm Value

This table investigates the effect of changes in the corporate tax rate on firm value in a panel of publicly listed firms from 2008 to 2013. The left hand side is *Tobin's Q*, obtained from Osiris as (Enterprise Value+Total Liabilities)/(Total Shareholder Equity (Book Value) + Total Liabilities). The key control variable is *Change in Tax Rate*, the percentage change in corporate tax rates over the previous year obtained from KPMG' *Corporate and indirect Tax Rate Survey 2014*. Tax Haven Subsidiary is an indicator variable equal to one if a firm has at least one subsidiary in a tax haven (as defined by the OECD 'Grey List'). Columns (1) and (2) use the full sample while Columns (3) and (4) use a sample of firms with tax haven subsidiary and control firms matched by industry, headquarter country, the natural logarithm of assets, and the natural logarithm of firms' age (measured by years since foundation). All regressions control for the natural logarithm of assets, the natural logarithm of assets squared, firm fixed effects, and time fixed effects. T-statistics for tests of significance of coefficients based on robust standard errors clustered at the country and year level (2-way clustering) are reported below coefficients. ***, ** and * indicate significance at the 1%, 5% and 10% level.

Table 5: Tax Information Exchange Agreements and Firm Value

This table studies the effect of Tax Information Exchange Agreements (TIEAs) on firm value using OLS regressions. Panel A uses annual data from 1996-2013 and measures firm value by Tobin's Q. Panel B uses daily data from 2003 to 2013 and measures firm value by stock returns. In Panel A, the left-hand side variable is the natural logarithm of Tobin's Q, calculated as (Enterprise Value+Total Liabilities)/(Total Shareholder Equity (Book Value) + Total Liabilities). The key control *Treated after* is an indicator variable equal to one in the years after a firm has been directly affected by a TIEA. A firm is directly affected (*treated*) if it is headquartered in a country that signs a TIEA and has a subsidiary in the other signatory country or non-sovereign nation (a tax haven). Some firms are affected by more than one TIEA: They are counted as treated the moment they are affected for the first time. Column (1) uses the full sample of firms. In columns (2) and (3), one non-treated (control) firm is matched to each treated firms five years prior to the year a TIEA is signed. In columns (4) and (5), up to 10 firms are matched to treated firms with replacement. *Control after* is an indicator variable equal to one in the years after a firm is control firm to a firm affected by a TIEA. Firms are matched with replacement by country and industry and then additionally by the natural logarithm of assets and the natural logarithm of their age, measured as the number of years since the founding year. All regressions control for the natural logarithm of assets, the natural logarithm of assets squared, firm fixed effects, and time fixed effects. *Treated=Control* provides the p-value from testing that the coefficient on *Treated after* equals that on *Control after*. T-statistics for tests of significance of coefficients based on robust standard errors clustered at the country and year level (2-way clustering) are reported below coefficients. In Panel B, the dependent variable is firms' raw return (Columns (1)-(4)), and alpha calculated using a 1-factor CAPM estimated for a rolling estimation period starting 292 days before the respective day and ending 40 days before the respective day using the local market index as benchmark (Columns (5)-(8)). *Treated* is a Dummy equal to 1 if a firm is directly affected by a TIEA for the first time (through being headquartered in one signatory country and having at least one subsidiary in the other signatory country) during respective *treatment periods*. A *treatment period* of [-t,t] denotes that a firm is treated within the next or has been treated within the previous t days because its headquarter country signs a TIEA with a relevant tax haven. All regressions include firm, year, and month fixed effects. Firm fixed effects are accounted for by demeaning the dependent variable. Dependent variables are multiplied by 100. *Treated* measures the average daily effect during the treatment period; *Economic Effect* documents the overall economic effect during the treatment period (= *Treated* coefficient * number of days in the *treatment period*). T-statistics for tests of significance of coefficients based on robust standard errors clustered at the firm and day level (2-way clustering) are reported below coefficients. ***, ** and * indicate significance at the 1%, 5% and 10% level.

Table 6: Tax Information Exchange Agreements and Firm Complexity

This table investigates differences between firm structure of tax haven and non-tax haven firms (Panels A and B) and tax haven firms' response to the passage of Tax Information Exchange Agreements (TIEAs). Subsidiary data is obtained from Dun & Bradstreet's *Who Owns Whom 2013/2014* (Panels A-C) and complemented by *Who Owns Whom 2008/2009* and 1998/1999 (Panel C). In Panel A, the first measure of complexity is $\ln(\text{Number of Subsidiaries})$, the number of subsidiaries and subsidiaries of subsidiaries owned to 50% or more. $\% \geq 2$ layers, $\% \geq 3$ layers, and $\% \geq 4$ layers are Dummy variables that takes a value of 1 if a firm has at least 2 (3, 4) hierarchical layers. A firm with at least one subsidiary that owns a subsidiary in turn is a firm with at least 2 layers ($\% \geq 2$ layers=1) by that definition. $\% > 1$ Subsidiary is a dummy equal to one if a firm has strictly more than 1 subsidiaries. Panel A follows Table 3 (Panels A and B) in splitting the sample into firms with and firms without tax haven subsidiary. Panel B provides results of OLS and probit regressions where the dependent variable is one of the complexity measure and the key control is a dummy equal to one if a firm has a tax haven subsidiary and zero otherwise. Besides including industry and country fixed effects, firm-level controls outlined in Table 3 are included. Panel C repeats our main analysis (Table 5) but treatment is additionally interacted with the complexity of firms' tax haven operations. Complexity of tax haven operations is measured by the natural logarithm of the number of tax haven subsidiaries (Columns 1-5) and the percentage of a firm's subsidiaries that are headquartered in tax havens (Columns 6-10). For matched subsamples, firms are matched with replacement by country and industry and additionally by the natural logarithm of assets and the natural logarithm of age, measured as the number of years since the founding year. Controls include changes in firm size, changes in firm size squared, and country fixed effects. T-statistics for tests of significance of coefficients based on robust standard errors clustered at the country and year level (2-way clustering) are reported below coefficients. ***, ** and * indicate significance at the 1%, 5% and 10% level.

Panel A: Are firms with tax haven subsidiary more complex?

Table 7: Tax Information Exchange Agreements and Haven Hopping

This table investigates whether firms moved their subsidiaries out of tax havens subsequent to tax havens entering Tax Information Exchange Agreements (TIEAs; Panel A) and whether doing so mitigates the effect of TIEAs on firm value (Panel B). Panel A is a conversion matrix tracking firms between (i) 1998 and 2008 and (ii) 2008 and 2013, respectively. The sample is a balanced panel of firms with subsidiary data for 1998 and 2008, as well as 2008 and 2013, respectively. In part (i) of Panel A, each row gives the number of firms in 1998 and each column gives the number of firms in 2008. Shown are the number of firms without tax haven subsidiary, with tax haven subsidiaries in a tax haven that signed a TIEA between 1998 and 2008, with only tax haven subsidiary in tax havens that did not sign a TIEA between 1998 and 2008, and the number of sample firms. Numbers and percentages denote the number of firms and the percentage of the group moving from a category in 1998 to a category in 2008. For instance, out of 2,350 sample firms, 2,274 firms (97%) did not have a tax haven subsidiary in 1998 and 2,091 of these 2,274 firms (92%) did not have a tax haven subsidiary in 2008 either. Part (ii) of Panel A reports the same for firms in 2008 and 2013. Part (i) ignores firms affected by TIEAs after 2008; Part (ii) ignores firms affected by TIEAs prior to 2008. Panel B repeats our main analysis (Table 5) but treatment is additionally interacted with being a *haven hopper*. The left hand side variable is Tobin's Q. The left-hand side variable is the natural logarithm of Tobin's Q, calculated as (Enterprise Value+Total Liabilities)/(Total Shareholder Equity (Book Value) + Total Liabilities). *Treated after* is an indicator variable equal to one in the years after a firm has been directly affected by a TIEA. A firm is directly affected (*treated*) if it is headquartered in a country that signs a TIEA and has a subsidiary in the other signatory country or non-sovereign nation (a tax haven). *Haven Hopper* is a dummy variable equal to 1 if a firm is treated by a TIEA and subsequently moves out of tax havens that entered TIEAs and into tax havens that did not enter TIEAs. T-statistics for tests of significance of coefficients based on robust standard errors clustered at the country and year level (2-way clustering) are reported below coefficients.

Table 8: Tax Information Exchange Agreements and Determinants of Firm Value

This table studies the effect of Tax Information Exchange Agreements (TIEAs) on various contributors to firm value using OLS regressions for a panel of firms from 1995 to 2013. The analysis follows exactly Table 7 but the left-hand side is *Profit Margin* (Profit&Loss before Tax / Operating Revenue in %), *Gross Margin* (Gross Profit / Operating Revenue in %), *Effective Tax Rate* (Income Taxes / Earnings before Interest, Tax, Depreciation and Amortization in %), *Beta* (estimated in a 1-factor model of monthly excess stock returns on the headquarter country's main market index' excess return over 24 months), and *Leverage* (Total Liabilities and Debt / Total Assets). Odd-numbered columns report results for the whole sample; even-numbered columns report results for a sample of treated and control firms. Control firms are matched by country and industry and then additionally by the natural logarithm of assets and the natural logarithm of their age, measured as the number of years since the founding year. All regressions control for the natural logarithm of assets, the natural logarithm of assets squared, firm fixed effects, and time fixed effects. *Treated=Control* provides the p-value from testing that the coefficient on *Treated after* equals that on *Control after*. T-statistics for tests of significance of coefficients based on robust standard errors clustered at the country and year level (2-way clustering) are reported below coefficients. ***, ** and * indicate significance at the 1%, 5% and 10% level.

Table 9: Tax Information Exchange Agreements and Cross-Sectional Results

This table follows Table 5 in studying the effect of Tax Information Exchange Agreements (TIEAs) on firm value using OLS regressions. The left-hand side variable is the natural logarithm of Tobin's Q. Set-up and controls follow Table 5 but the treatment dummy is additionally interacted with firm characteristics. These interaction terms are generally continuous measures with the exception of patent dummies equal to one if a firm has at least one patent (Panel A Columns (3)-(4)), trademark dummies equal to one if a firm has at least one trademark (Panel A Columns (7)-(8)), and institutional ownership dummies equal to one if a firm has above-median institutional ownership by country and industry. Variable construction follows Table 3.

Appendix 1: Country-level regressions with log(GDP pc) control

This table presents the results of country-level logit models. The dependent variable *%TH Firms* denotes the % of publicly listed firms that have at least one subsidiary headquartered in a tax haven where tax havens are countries or non-sovereign nations that appear on the OECD 'Grey List' (as of August 17, 2009). Sample countries are those listed in Table 2 with the exception of countries that are a Tax Haven by any of the different tax haven definitions given in Table 1. Panel A reports results for equally weighted observations; Panel B reports results for value weighted observations where weights are determined by the % of public firms in the overall sample. All regressions control for log(GDP per capita). *Log (GDP per capita)* is the natural logarithm, of GDP per capita in USD in 2013 (Source: World Bank). *Corporate Tax Rate* is the maximum corporate tax rate bracket and *Income Tax Rate* is the maximum income tax bracket in 2013, obtained through various sources (largely government agencies and audit firms). *Total Tax* is *Corporate Tax Rate + (1 - Corporate Tax)*Income Tax*. *Tax Evasion* is obtained from the Global Competitiveness Report conducted by the World Economic Forum: Countries' tax evasion is rated on a scale from 1 (strongly disagree) to 7 (strongly agree) to the statement 'Tax evasion is minimal.'. *ICRG (Property Rights Protection)* captures political, economic and financial risk in 2013 and is obtained from the International Country Risk Guide; the measure ranges from 1 to 6 and increases in protection. *Corruption Level* is based on Transparency International's Corruption Perception Index as of 2013 (Source: Transparency International), an index that measures corruption levels on a scale from 1 (high corruption) to 10 (low corruption). T-statistics for tests of significance based on robust standard errors are reported below coefficients. ***, ** and * indicate significance at the 1%, 5% and 10% level.

Appendix 3: Tax Information Exchange Agreements passed by Non-Tax Haven Countries

This table lists Tax Information Exchange Agreements (TIEAs) involving exactly one tax haven country (or non-sovereign nation) and one non-tax haven country (Source: OECD *Harmful Tax Practices*) and affecting at least one sample firm. Listed are non-tax haven signatories (Panel A) and Tax Haven signatories. This table lists all 362 such agreements – some sample firms may be affected by more than one of these agreements.

Panel A: Non-Tax Havens

Panel B: Tax Havens

Appendix 4: The Passage of Tax Information Exchange Agreements (TIEAs) and Economic Ties

This table presents the results of logit models explaining the passage of Tax Information Exchange Agreements (TIEAs) between pairs of tax haven territories and non-tax haven countries. The left hand side variable is a Dummy variable equal to one if a pair has passed a TIEA by the end of 2013. Pairs are constructed from countries used in our sample (Table 1) and tax havens that occur on our tax haven list (Table 2). The key right hand side control is the economic link between respective pairs. In Columns (1), (3) and (5), economic ties are measured by the sum of the number of subsidiaries of public and private firms from country 1 in country 2 and the number of subsidiaries of public and private firms from country 2 in country 1. In Columns (2), (4) and (6), economic ties are measured by the maximum of the number of subsidiaries of public and private firms from country 1 in country 2 and the number of subsidiaries of public and private firms from country 2 in country 1. Columns (7) to (8) repeat the analysis using the number of subsidiaries of publicly listed firms. The right hand side includes fixed effects for non-tax haven countries (Columns (1) and (2)), tax haven territories (Columns (3) and (4)), and both (Columns (5)-(8)). T-statistics for tests of significance based on robust standard errors clustered at the non-tax haven country level are reported below coefficients. ***, ** and * indicate significance at the 1%, 5% and 10% level.

Figure 1: The use of tax haven subsidiaries and country characteristics

This Figure illustrates the use of tax haven subsidiaries at the country level. The y-axis denotes the percentage of publicly listed firms that have at least one tax haven subsidiary. Subsidiary data is collected from Dun & Bradstreet’s *Who Owns Whom 2013/2014* book series. Tax havens are sovereign countries or non-sovereign nations that appear on the OECD grey list (as of August 17, 2009); Hong Kong, Singapore and Ireland are omitted because they constitute tax havens by that list or other official tax haven lists. The x-axis denotes country level characteristics. *Corporate Tax Rate* is the maximum corporate tax rate bracket and *Income Tax Rate* is the maximum income tax bracket in 2013, obtained through various sources (largely government agencies and audit firms). *ICRG (Property Rights Protection)* captures political, economic and financial risk in 2013 and is obtained from the International Country Risk Guide; the measure ranges from 1 to 6 and increases in protection. *Corruption Level* is based on Transparency International’s Corruption Perception Index as of 2013 (Source: Transparency International), an index that measures corruption levels on a scale from 1 (high corruption) to 10 (low corruption). *Tax Evasion* is obtained from the Global Competitiveness Report conducted by the World Economic Forum: Countries’ tax evasion is rated on a scale from 1 (strongly disagree) to 7 (strongly agree) to the statement ‘Tax evasion is minimal.’. *Log (GDP per capita)* is the natural logarithm, of GDP per capita in USD in 2013 (Source: World Bank). Each country observation is represented by an ‘X’; the line of best fit for equally weighted observations is shown.

Panel A: Corporate Tax Rate and Income Tax Rate

Panel B: Property Rights Protection and Corruption Level

Panel C: Tax Evasion and log(GDP per capita)

Figure 2: Value and use of tax haven subsidiaries around changes in corporate tax rates

This figure plots changes in the corporate tax rate between 2008 and 2013 against changes in firm value and changes in the use of tax haven subsidiaries, respectively. Changes in the corporate tax rate are obtained from KPMG' *Corporate and indirect Tax Rate Survey 2014*; a negative value denotes a reduction in corporate tax rates over the five year period. On the left, the y-axis denotes changes in the difference in Tobin's Q from 2008 to 2013. Specifically, the difference between Tobin's Q of firms with tax haven subsidiaries in 2008 and firms without tax haven subsidiaries in 2008 is deducted from the respective difference in 2013. A negative value denotes that firms with tax haven subsidiary have become relatively less valuable over the five year period. Subsidiary data is collected from Dun & Bradstreet's *Who Owns Whom 2013/2014* book series. Tax havens are sovereign countries or non-sovereign nations that appear on the OECD grey list (as of August 17, 2009). *Tobin's Q* is obtained from Osiris as $(Enterprise\ Value + Total\ Liabilities) / (Total\ Shareholder\ Equity\ (Book\ Value) + Total\ Liabilities)$. On the right, the y-axis denotes the difference between the percentage of firms with tax haven subsidiaries in 2013 and the percentage of firms with tax haven subsidiaries in 2008. A positive value means that the fraction of firms with tax haven subsidiary has increased over the five year period. Each country observation is represented by an 'X'; the line of best fit for equally weighted observations is shown.

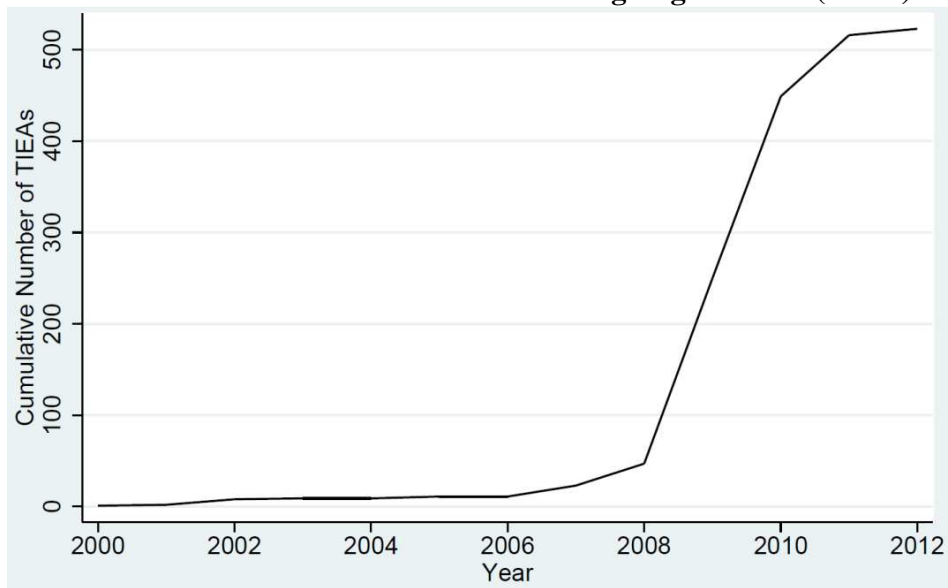

Figure 3: Tax Information Exchange Agreements and Treated Firms over time

This figure shows the evolution of passed Tax Information Exchange Agreements (TIEAs) and treated firms over time. The graph on the left shows all TIEAs passed between two countries or non-sovereign nations (Source: OECD *Harmful Tax Practices*). The graph on the right shows the number of publicly listed firms directly affected by TIEAs at any point in time. A firm is directly affected (*treated*) if it is headquartered in a country that signs a TIEA and has a subsidiary in the other signatory country (a tax haven). Some firms are affected by more than one TIEA: They are counted as treated the moment they are affected for the first time.

Panel A: Cumulative Number of Tax Information Exchange Agreements (TIEA) over Time

Panel B: Cumulative Number of Treated Firms over Time

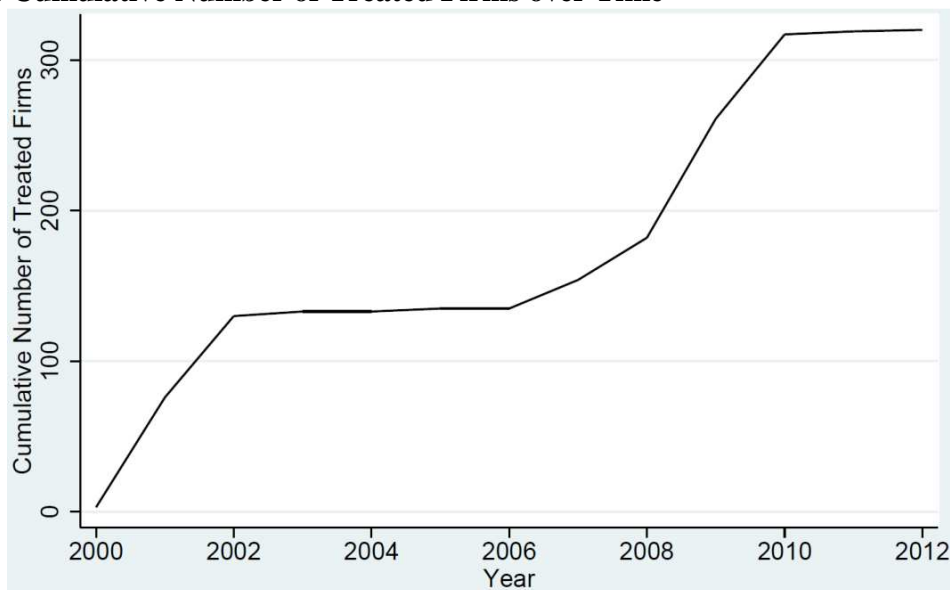

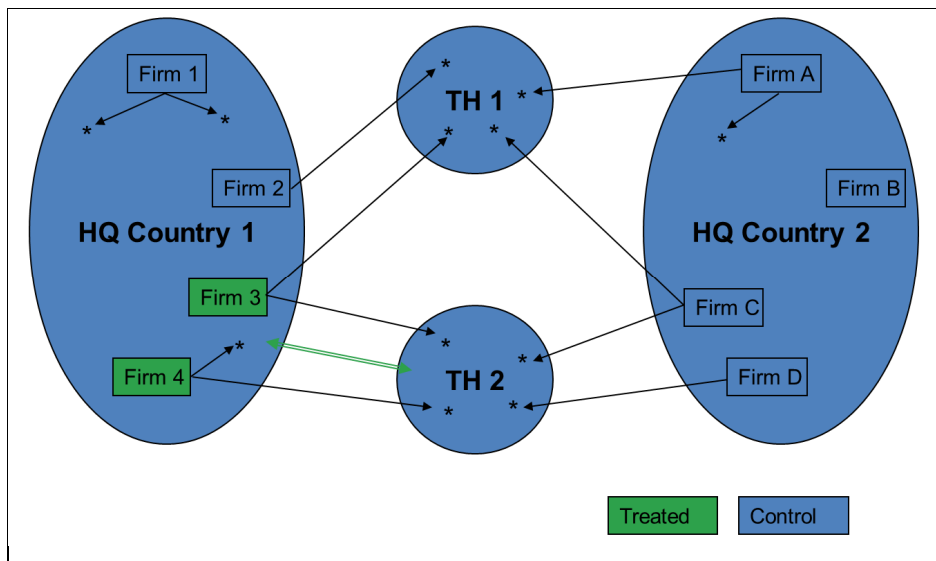

Figure 4: Illustration of the Identification Strategy

This figure illustrates the identification strategy. Firms 1 through to 4 are headquartered in Headquarter Country 1. Firms A through to D are headquartered in Headquarter Country 2. Asterisks denote subsidiaries, some of which are in tax havens, and arrows denote parent firms of these subsidiaries. In Panel A, at time t , HQ Country 1 and Tax Haven 2 enter a Tax Information Exchange Agreement (TIEA) and Firms 3 and 4 become treated while all remaining firms in both countries act as control firms. In Panel B, at some later point in time $t+s$, HQ Country 2 and Tax Haven 1 also enter a TIEA which means that (besides Firms 3 and 4) Firms A and C become treated while Firms 1, 2, B, and D are control firms. In robustness tests, one treated firm is matched to one control firm that is headquartered in the same country, operates in the same industry, and is similar in age and size.

Panel A: At time t , Headquarter Country 1 and Tax Haven 2 enter a TIEA

Panel B: At time $t+s$, Headquarter Country 2 and Tax Haven 1 also enter a TIEA

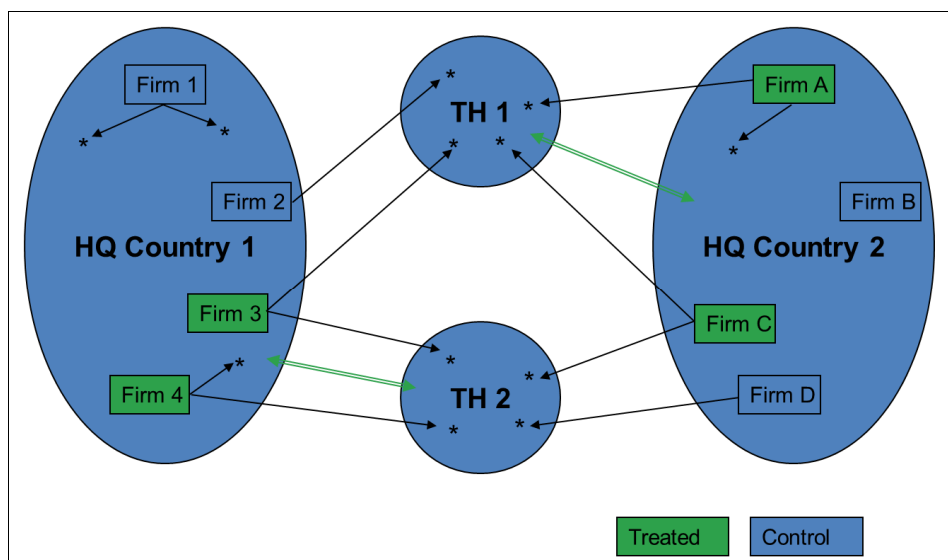

Figure 5: Firm Value around the Passage of Tax Information Exchange Agreements (TIEAs)

This figure shows the evolution of firm value of treated firms relative to control firms around the passage of Tax Information Exchange Agreements (TIEAs). The x-axis denotes years around the passage of TIEAs. The y-axis shows the interaction between year-to-event dummies and an indicator variable that equals 1 if a firm is directly affected by a TIEA. Interaction terms are obtained from an OLS regression on a sample of treated and control firms with the natural logarithm of Tobin's Q on the left hand side and controls for size and size squared as well as year and industry fixed effects on the right. Control firms are matched to treated firms 5 years before treatment by headquarter country, industry, as well as the natural logarithm of assets and the natural logarithm of assets squared.

Figure 6: Daily returns of affected firms around the passage of Tax Information Exchange Agreements (TIEAs)

This figure plots cumulative returns of firms affected by Tax Information Exchange Agreements (TIEAs) over the 100 days surrounding the signing of a TIEA. A firm is directly affected (*treated*) if it is headquartered in a country that signs a TIEA and has a subsidiary in the other signatory country (a tax haven). Some firms are affected by more than one TIEA: They are counted as treated the moment they are affected for the first time. Event dates are spread over 10 years (2002 to 2011). Returns are obtained from Datastream/Worldscope and cumulated; cumulative returns are standardized to equal zero a day before the signature date.
