## Materials

4-Acetylpyridine, ammonium hexafluorophosphate, 4,4-bipyridine, 2,5-di-tert-butyl-4methoxyphenol, bromomethylbenzene, 1,3-bis(bromomethyl)benzene, 1,3,5$\operatorname{tris}\left(\right.$ bromomethyl)benzene, chloroform- $d_{3} \quad(99.5 \%$ atom $\quad \mathrm{D}), \quad 18$-crown-6, 1,2dimethoxyethane (DME, 99.5\%, anhydrous), ethyl iodide, potassium carbonate, propylene carbonate (PC, 99.7\%, anhydrous), silver(I) hexafluorophosphate (99.99\% trace metals grade), tetrabutylammonium hexafluorophosphate (TBAPF $6, ~ 99.0 \%$ ), tetrafluoroterephthalonitrile (99\%), and 3,3,3',3'-tetramethyl-1,1'-spirobisindane$5,5^{\prime}, 6,6^{\prime}$-tetraol ( $96 \%$ ) were obtained from Sigma-Aldrich. Battery grade lithium hexafluorophosphate ( $\mathrm{LiPF}_{6}$ ) (99.9+\%) was obtained from STREM Chemicals, Inc. 2,6-Bis(4-azidobenzylidene)cyclohexanone ( $90 \%$, wetted with ca. $30 \%$ water) was obtained from TCI. $N$-ethyl-4,4'-bipyridinium hexafluorophosphate and viologen monomer (1a) were synthesized using reported protocols. ${ }^{1}$ Glassy carbon electrodes with 1 mm diameter were purchased from BAS Inc. (West Lafayette, IN) and polished before each experiment with $3-\mu \mathrm{m}$ diamond paste. $\mathrm{Ag} / \mathrm{Ag}^{+}$reference electrodes were purchased from CHI instruments (Austin, TX) and filled with 10 mM silver(I) hexafluorophosphate in 0.5 M $\mathrm{LiPF}_{6}$ in ACN (for experiments in ACN ) or $0.1 \mathrm{M} \mathrm{TBAPF}_{6}$ in PC or DME (for experiments in PC or DME, respectively). A bulk electrolysis cell with a reticulated vitreous carbon working electrode and platinum wire counter electrode was purchased from BAS Inc. (West Lafayette, IN). Celgard ${ }^{\circledR} 2325$ was purchased from Celgard (Charlotte, NC). Daramic 175 was received as a free sample from Daramic (Charlotte, NC ). $\mathrm{N}, \mathrm{N}$-dimethylformamide (DMF) and acetonitrile ( ACN ) were taken from a JC Meyer solvent system. Chloroform (HPLC grade) and methanol were obtained from EMD Millipore. All chemicals were used as received unless otherwise specified. Lithium hexafluorophosphate and tetrabutylammonium hexafluorophosphate were dried under vacuum for 16 h at $100^{\circ} \mathrm{C}$ and $90^{\circ} \mathrm{C}$, respectively. ACN was dried over $3 \AA$ molecular sieves to $<20 \mathrm{ppm}$ water. For experiments with ROM and RAOs 1a-3a, electrolyte refers to $0.1 \mathrm{M} \mathrm{LiPF}_{6}$ in acetonitrile. For experiments with RAOs 3b or 3c, electrolyte refers to 0.1 M tetrabutylammonium hexafluorophosphate in propylene carbonate or 1,2dimethoxyethane, respectively.

## Instrumentation

Unless otherwise mentioned, all manipulations were performed in an argon glovebox with oxygen and water levels below 5 and 1 ppm , respectively. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on Bruker Avance II 500 MHz , Varian Unity 500, and VXR 500 NMR spectrometers. Chemical shifts are reported in $\delta$ ( ppm ) relative to the residual solvent peak $\left(\mathrm{CD}_{3} \mathrm{CN}\right.$ : 1.94 for ${ }^{1} \mathrm{H}$; 1.32 for ${ }^{13} \mathrm{C}, \mathrm{CDCl}_{3}: 7.24$ for ${ }^{1} \mathrm{H}$; 77.23 for ${ }^{13} \mathrm{C}$, DMSO- $d_{6}$ : 2.50 for ${ }^{1} \mathrm{H}$; 39.51 for ${ }^{13} \mathrm{C}$ ). Coupling constants $(J)$ are expressed in Hertz (Hz). Splitting patterns are designated as $s$ (singlet), $d$ (doublet), $t$ (triplet), $q$ (quartet), dd(doublet of doublets), and m(multiplet). Low- and high-resolution EI mass spectra were recorded on a Micromass $70-\mathrm{VSE}$ spectrometer. Low- and high-resolution ESI mass spectra were recorded on a Synapt G2 Q-Tof spectrometer. High-resolution ESI-MS of 3b and 3c were performed by the University of California, Berkeley QB3/Chemistry Mass Spectrometry Facility. Elemental analyses were performed by the University of California, Berkeley

College of Chemistry Microanalytical Facility. Polymer molecular weight was measured using size-exclusion chromatography with a Malvern Viscotek TDA 302 system calibrated with a $99-\mathrm{kDa}$ monodisperse polystyrene standard. Electrochemical experiments were performed on a Bio-Logic VMP3 potentiostat. Cyclic voltammograms were acquired with iR drop compensation by measuring the uncompensated resistance with a 100 kHz impedance measurement and correcting for $85 \%$ of the expected drop. FT-IR spectra were acquired in transmission mode on a Varian 3100 FT-IR spectrometer. Water content measurements were performed on a Mettler Toledo C20 Coulometric KF Titrator Karl-Fischer apparatus.

## Synthesis of $N$-ethyl-4,4'-bipyridinium hexafluorophosphate

$N$-ethyl-4,4'-bipyridinium hexafluorophosphate was synthesized as described previously. ${ }^{1}$ Briefly, ethyl iodide ( $5.12 \mathrm{~mL}, 64.0 \mathrm{mmol}, 1.0$ equiv) was added to a solution of 4,4-bipyridine ( $10.0 \mathrm{~g}, 64.0 \mathrm{mmol}, 1.0$ equiv) in $\mathrm{DCM}(50 \mathrm{~mL})$. As the reaction progressed, an orange solid precipitated from solution. The mixture was stirred for 24 h at RT , and additional orange solid was precipitated from solution by adding diethyl ether. The solid was isolated by filtration and rinsed with DCM/ether (1:1 v/v). The solid was then dissolved in a minimum volume of water and ammonium hexafluorophosphate $(53.0 \mathrm{~g}, 325 \mathrm{mmol}, 5.0$ equiv) was added portion-wise. As ammonium hexafluorophosphate was added, a beige solid precipitated out of solution. The resulting mixture was stirred for 24 h , and the solid was isolated by filtration, followed by rinsing with water, methanol, and ether. The resulting solid was dried under vacuum for 24 h to yield $N$-ethyl-4,4'-bipyridinium hexafluorophosphate ( $6.27 \mathrm{~g}, 30 \%$ yield, 2 steps) as a beige solid.

2a

## Synthesis of viologen dimer (2a)

1,3-Bis(bromomethyl)benzene ( $2.5 \mathrm{~g}, 9.47 \mathrm{mmol}, 1.0$ equiv) was reacted with $N$-Ethyl-4,4'-bipyridinium hexafluorophosphate ( $12.5 \mathrm{~g}, 37.9 \mathrm{mmol}, 4$ equiv) in DMF. The solution was then allowed to reach $60^{\circ} \mathrm{C}$ and stirred at this temperature for 3 days. Solids precipitated out as the reaction progressed. The mixture was added to diethyl ether, and the solids filtered and rinsed with additional diethyl ether. The solids were then dissolved in a minimal amount of acetonitrile/water $(1: 4, v / v)$ and ammonium hexafluorophosphate
(10 equiv) in a minimal amount of water was added portion wise. The resulting mixture was stirred for 24 h . Acetonitrile was removed under reduced pressure and water was added to the mixture to further precipitate out the solid. The solid was filtered out and rinsed with water, methanol, and diethyl ether. The product was dried under vacuum for 24 h to yield the viologen dimer, $\mathbf{2 a}(8.0 \mathrm{~g}, 80 \%, 2$ steps $)$ as a white powder. ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{CN}$ ): $\delta 8.96-8.91(\mathrm{~m}, 8 \mathrm{H}), 8.41-8.38(\mathrm{~m}, 8 \mathrm{H}), 7.61-7.60(\mathrm{~m}, 4 \mathrm{H})$, $5.84(\mathrm{~s}, 4 \mathrm{H}), 4.68(\mathrm{q}, J=7.5 \mathrm{~Hz}, 4 \mathrm{H}), 1.65 \mathrm{ppm}(\mathrm{t}, J=5 \mathrm{~Hz}, 6 \mathrm{H}){ }^{13} \mathrm{C}$ NMR ( 125 MHz , $\left.\mathrm{CD}_{3} \mathrm{CN}\right): \delta 151.7,150.9,146.8,146.5(\mathrm{t}, J=8.1 \mathrm{~Hz}), 146.4,134.9,131.9,131.8,131.5$, 128.5, 128.3, 65.2, 58.8, 16.6 ppm ; HRMS (ESI-TOF): $m / z$ for $\mathrm{C}_{32} \mathrm{H}_{34} \mathrm{~F}_{18} \mathrm{~N}_{4} \mathrm{P}_{3}\left(\mathrm{M}-\mathrm{PF}_{6}{ }^{-}\right)^{+}$ calculated 909.1709, found 909.1667.

## Synthesis of viologen trimer (3a)

1,3,5-Tris(bromomethyl)benzene ( $3.37 \mathrm{~g}, 9.46 \mathrm{mmol}, 1.0$ equiv) was reacted with N -ethyl-4,4'-bipyridinium hexafluorophosphate ( $10.0 \mathrm{~g}, 30.28 \mathrm{mmol}, 3.2$ equiv) in DMF. The solution was then allowed to reach $60^{\circ} \mathrm{C}$ and stirred at this temperature for 3 days. Solid precipitated out as the reaction progressed. The mixture was added to diethyl ether, and the solid was filtered out and rinsed with additional diethyl ether. The solid was then dissolved in a minimal amount of acetonitrile/water ( $1: 4, v / v$ ) and ammonium hexafluorophosphate ( 10 equiv) in a minimal amount of water was added portion wise. The resulting mixture was stirred for 24 h . Acetonitrile was removed under reduced pressure and water was added to the mixture to further precipitate out the solid. The solid was filtered out and rinsed with water, methanol, and diethyl ether. The solid was dried under vacuum for 24 h to yield the viologen trimer, $\mathbf{3 a}$ ( $10.3 \mathrm{~g}, 69 \%$, 2 steps) as a white powder. ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{CN}$ ): $\delta 8.92(\mathrm{~d}, J=10 \mathrm{~Hz}, 12 \mathrm{H}), 8.41-8.37(\mathrm{~m}, 12 \mathrm{H})$,
$7.67(\mathrm{~s}, 3 \mathrm{H}), 5.84(\mathrm{~s}, 6 \mathrm{H}), 4.68(\mathrm{q}, J=7.5 \mathrm{~Hz}, 6 \mathrm{H}), 1.65 \mathrm{ppm}(\mathrm{t}, J=7.5 \mathrm{~Hz}, 9 \mathrm{H}) ;{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $125 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{CN}$ ): $\delta 152.0,151.0,147.0,146.6,136.2,133.1,128.7,128.4,64.9$, 59.0, 16.8 ppm ; HRMS (ESI): $m / z$ for $\mathrm{C}_{45} \mathrm{H}_{48} \mathrm{~N}_{6} \mathrm{PF}_{6}{ }^{5+}\left(\mathrm{M}-5 \mathrm{PF}_{6}\right)^{5+}$ calculated 163.4711, found 163.4710; m/z for $\mathrm{C}_{45} \mathrm{H}_{48} \mathrm{~N}_{6} \mathrm{P}_{2} \mathrm{~F}_{12}{ }^{4+}\left(\mathrm{M}-4 \mathrm{PF}_{6}^{-}\right)^{4+}$ calculated 240.5801, found 240.5798; m/z for $\mathrm{C}_{45} \mathrm{H}_{48} \mathrm{~N}_{6} \mathrm{P}_{3} \mathrm{~F}_{18}{ }^{3+}\left(\mathrm{M}-3 \mathrm{PF}_{6}-\right)^{3+}$ calculated 369.0950, found 369.0945; Anal. Calc'd for $\mathrm{C}_{45} \mathrm{H}_{48} \mathrm{~N}_{6} \mathrm{P}_{6} \mathrm{~F}_{36}$ : C, 35.04; H, 3.14; N, 5.45; Found: C, 34.92; H, 3.21; N, 5.34.

## Synthesis of acylpyridinium trimer (3b)

4-Acetylpyridine ( $10.0 \mathrm{~g}, 83 \mathrm{mmol}, 4.0$ equiv) was added to a solution of $1,3,5-$ tris(bromomethyl)benzene ( $7.4 \mathrm{~g}, 21 \mathrm{mmol}, 1.0$ equiv) in acetonitrile ( 100 mL ). The solution was stirred at $60^{\circ} \mathrm{C}$ for 5 days. A precipitate formed, and was filtered and rinsed with diethyl ether. The solid was then dissolved in acetonitrile and water, and ammonium hexafluorophosphate ( $21.0 \mathrm{~g}, 130 \mathrm{mmol}, 6.2$ equiv) was added. The mixture was stirred overnight. Acetonitrile was removed under reduced pressure, and the solid was filtered off, dissolved in a minimal amount of acetonitrile, and precipitated by adding excess water with vigorous stirring. This process was repeated once more, followed by rinsing the solid with methanol $(2 \times)$ and diethyl ether. The product was dried overnight to yield 17 g of the acylpyridinium trimer, $\mathbf{3 b}$ ( $89 \%$, over 2 steps). Further purification of $\mathbf{3 b}$ was carried out by dissolving the crude mixture in a minimal amount of acetonitrile and then filtering away the dark-colored solids. Water was added to the filtrate and the mixture was cooled at $4{ }^{\circ} \mathrm{C}$ to precipitate $\mathbf{3 b}$ as a tan solid, which was isolated by filtration. The product was washed with methanol ( 50 mL ) and diethyl ether $(50 \mathrm{~mL})$ before drying in vacuo. ${ }^{1} \mathrm{H}$ NMR ( 500 MHz, DMSO- $d_{6}$ ): $\delta 9.28(\mathrm{~d}, J=7 \mathrm{~Hz}, 6 \mathrm{H}), 8.55$ (d, $J=7 \mathrm{~Hz}, 6 \mathrm{H}$ ), $7.62(\mathrm{~s}, 3 \mathrm{H}), 5.90(\mathrm{~s}, 6 \mathrm{H}), 2.76(\mathrm{~s}, 9 \mathrm{H}) \mathrm{ppm} ;{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR (125 MHz, DMSO- $d_{6}$ ): $\delta$ 160.6, 149.0, 146.6, 135.8, 126.4, 62.8, 27.4 ppm ; HRMS (ESI): $\mathrm{m} / \mathrm{z}$ for $\mathrm{C}_{30} \mathrm{H}_{30} \mathrm{O}_{3} \mathrm{~N}_{3}{ }^{3+}$ $\left(\mathrm{M}-3 \mathrm{PF}_{6}{ }^{-}\right)^{3+}$ calculated 160.0757, found $160.0755 ; \mathrm{m} / \mathrm{z}$ for $\mathrm{C}_{30} \mathrm{H}_{30} \mathrm{O}_{3} \mathrm{~N}_{3} \mathrm{PF}_{6}{ }^{2+}(\mathrm{M}-$ $\left.2 \mathrm{PF}_{6}{ }^{-}\right)^{2+}$ calculated 312.5959, found 312.5955 ; $\mathrm{m} / \mathrm{z}$ for $\mathrm{C}_{30} \mathrm{H}_{30} \mathrm{O}_{3} \mathrm{~N}_{3} \mathrm{P}_{2} \mathrm{~F}_{12}{ }^{+}\left(\mathrm{M}-\mathrm{PF}_{6}^{-}\right)^{+}$ calculated 770.1565, found 770.1554; Anal. Calc'd for $\mathrm{C}_{30} \mathrm{H}_{30} \mathrm{P}_{3} \mathrm{~F}_{18} \mathrm{~N}_{3} \mathrm{O}_{3}$ : C, 39.36; H, 3.30; N, 4.59; Found: C, 39.23; H, 3.48; N, 4.49.

## Synthesis of DB3 trimer (3c)

To a solution of 2,5-di-tert-butyl-4-methoxyphenol (7.80 g, 33 mmol ), 1,3,5tris(bromomethyl)benzene ( $3.57 \mathrm{~g}, 10 \mathrm{mmol}$ ), and 18 -crown-6 ( $871 \mathrm{mg}, 1.0 \mathrm{mmol}$ ) in acetone $(50 \mathrm{~mL})$ was added freshly pulverized, oven-dried potassium carbonate ( 6.83 g , 49.5 mmol ) while stirring vigorously. The reaction mixture was heated at reflux for 16 h , cooled, and then the solids filtered; the solids were then washed with dichloromethane (3 $\times 50 \mathrm{~mL}$ ). The filtrate was concentrated in vacuo. The crude product was dissolved in diethyl ether ( 150 mL ), which was then extracted with aqueous sodium hydroxide ( $15 \%$ $w / w)(3 \times 50 \mathrm{~mL})$, water $(1 \times 50 \mathrm{~mL})$, and brine $(1 \times 50 \mathrm{~mL})$. The ethereal layer was dried over magnesium sulfate, which was removed by filtration. After concentrating the ethereal layer in vacuo, the product was recrystallized from ethanol/dichloromethane to yield $\mathbf{3 c}$ as colorless needles $(7.44 \mathrm{~g}, 90 \%) .{ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 7.52(\mathrm{~s}, 3 \mathrm{H})$, $6.89(\mathrm{~s}, 3 \mathrm{H}), 6.85(\mathrm{~s}, 3 \mathrm{H}), 5.10(\mathrm{~s}, 6 \mathrm{H}), 3.81(\mathrm{~s}, 9 \mathrm{H}), 1.37(\mathrm{~s}, 27 \mathrm{H}), 1.32(\mathrm{~s}, 27 \mathrm{H}) \mathrm{ppm}$; ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 152.4,151.3,138.9,136.8,136.5,125.8,113.1$, $111.9,71.4,56.1,34.9,34.8,30.2,30.0 \mathrm{ppm}$; HRMS (ESI): $\mathrm{m} / \mathrm{z}$ for $\mathrm{C}_{54} \mathrm{H}_{78} \mathrm{O}_{6}{ }^{+}(\mathrm{M})^{+}$ calculated 822.5793, found 822.5792; Anal. Calc'd for $\mathrm{C}_{54} \mathrm{H}_{78} \mathrm{O}_{6}$ : C, 78.79; H, 9.55; Found: C, 78.81; H, 9.60.

## Synthesis of PIM-1

PIM-1 with molecular weight $M_{W}=386 \mathrm{~kg} \mathrm{~mol}^{-1}\left(M_{N}=136 \mathrm{~kg} \mathrm{~mol}^{-1}\right.$, PDI= 2.8) was synthesized as described elsewhere. ${ }^{2-4}$ Briefly, a mixture of anhydrous potassium carbonate ( $8.3 \mathrm{~g}, 60 \mathrm{mmol}$ ), 3,3,3', $3^{\prime}$ 'tetramethyl-1,1'-spirobisindane-5,5',6,6'-tetrol ( 6.8 g, 20 mmol ) and 2,3,5,6-tetrafluoroterephthalonitrile ( $4.0 \mathrm{~g}, 20 \mathrm{mmol}$ ) in dry DMF was stirred at $65^{\circ} \mathrm{C}$ for 4 d . On cooling, the mixture was added to water and the crude product collected by filtration. Repeated precipitations from a concentrated solution of polymer in chloroform into methanol yielded 8.90 g ( $19.3 \mathrm{mmol}, 97 \%$ yield) of the fluorescent yellow polymer (PIM-1).

## Membrane preparation

PIM-1 was dissolved in chloroform at a concentration of $12.5 \mathrm{mg} \mathrm{mL}^{-1}$. PIM-1 membranes were cast by depositing 1 mL of solution into 3.5 cm diameter Teflon wells. The solvent was left to evaporate under an evaporation dish under ambient pressure for 5 h or until dryness. The films were further dried in vacuo overnight. Cross-linked PIM-1 membranes were prepared by adding 0.1 molar equivalents of 2,6-bis(4-azidobenzylidene)-cyclohexanone to the casting solution. Once dried, the cross-linked films were activated by heating in a vacuum oven at $175{ }^{\circ} \mathrm{C}$ for 7.5 h . The dried films were used as cast and Celgard ${ }^{\circledR} 2325$ membranes were punched into 1 and $3 / 16$ inch circles. All membranes were soaked in electrolyte overnight before use.

## Computational methods

## Computational methodology

The systematic study of solvation structures of ROMs at different states of charges was performed in two steps. In the first step, the quantum mechanical study of small molecular clusters (isolated molecules) of RAOs (1a, 2a, 3a), ACN and $\mathrm{PF}_{6}^{-}$at $T=0 \mathrm{~K}$ was carried out. First, we calculated the lowest energy molecular configurations of the RAOs with and without counter-ions and solvent (ACN) molecules. Next we evaluated charge distributions, and performed HOMO/LUMO orbital analysis (Figures S1-3). The purpose of these calculations was to see the distribution of charge in different states of charge as well as to check if there was a significant orbital overlap between viologens,
solvent ( ACN ) molecules and counter-ions $\left(\mathrm{PF}_{6}^{-}\right)$. The effects of finite temperature and condensed liquid phase on the ROMs solvation in ACN were accounted for by the use of classical MD. The Generalized Amber force field ${ }^{5}$ (GAFF) was used for solute and solvent molecules as well as for counter-ions. Note that GAFF charges on nitrogen atoms underestimate the effects of the polarity of the ROM molecules. The comparison between the GAFF charge scheme and the charges obtained ab initio is shown in Tables S1-S2. Therefore, in our simulations we used GAFF force field parameters in combination with Mulliken partial charges derived from ab initio calculations for the optimized geometry of ROMs. The free energy profiles were computed using the metadynamics technique. ${ }^{6,7}$ For the study of solvated structures of RAOs/ACN we calculated pair radial distribution functions (rdf) obtained with an algorithm adapted for non-spherical objects. Instead of taking the center of the mass of the ROM molecule as a reference point for the rdf, the algorithm explicitly evaluates the distribution of distances from each atom of the ROM molecule to the solvent molecules (either the center of the mass of ACN or a particular atom in the solvent molecule, e.g., N ) by sampling the MD trajectory.

## Quantum chemistry calculations

Optimized geometries, relative energies, and molecular orbitals were calculated with the DFT TeraChem package. ${ }^{8}$ As suggested in the previous extensive computational studies of aprotic ionic liquids, for RAOs/ACN systems in our calculations we used the B3LYP5-D3 functional with the $6-311++\mathrm{G}^{* *}$ basis set ${ }^{9}$ employing the third version of Grimme's empirical dispersion correction. ${ }^{10}$ We used the L-BFGS geometry optimization
method ${ }^{11}$ with the termination criterion for the maximum energy gradient component of $4.5 \times 10^{-4} \mathrm{au}$. The wave function convergence threshold was set as $3.0 \times 10^{-5}$. The twoelectron integral threshold was set as $1.0 \times 10^{-12}$, and the basis set linear dependency threshold was $1.0 \times 10^{-4}$. Partial charges were computed using the full natural bond orbital (NBO) and Mulliken analysis. For the open shell molecules unrestricted KohnSham orbitals were computed.

## Molecular dynamics calculations

Classical molecular dynamics (MD) simulations were conducted on the solutions (ROMs and RAOs in ACN ) - with $\mathrm{PF}_{6}^{-}$ions added accordingly to attain zero total charge-using the LAMMPS simulation package. ${ }^{12}$ Long-range electrostatic interactions were treated within the particle-mesh Ewald (PME) method with a cutoff distance 1.0 nm with grid spacing in $k$-space of $10^{-5}$. A cut-off of 1.0 nm with a spline from 0.9 to 1.0 nm was used for Lennard-Jones interactions. The relaxation of the initial structures was performed in two steps, first using steepest descent with a convergence criterion of $10^{-4} \mathrm{kcal} \mathrm{mol}^{-1}$ for energies and $10^{-4} \mathrm{kcal} \mathrm{mol}^{-1} \AA^{-1}$ for forces. The systems were first heated to 298 K in the canonical ensemble (NVT). To remove any "memory" effects, the systems were first melted at 400 K and then annealed back to 298 K three times (evolving the trajectory 2 ns for annealing each step). Then, isothermal-isobaric (NPT, $P=1 \mathrm{~atm}, T=298 \mathrm{~K}$ ) simulations were performed for 2 ns ( 2 fs time step) to obtain the correct density using a Nose/Hoover thermostat and Nose/Hoover barostat. ${ }^{13,14}$ Afterwards, NVT simulations were performed ( $T=298 \mathrm{~K}$ ) for 1 ns ( 2 fs time step) to equilibrate and sample the properties of interest. Structural properties were obtained from 10 ns MD simulation runs with an integration time step 1 fs in NVT ensemble. We ran several parallel simulations of solvated 1a, 2a and 3a at different concentrations. For 1a, $C_{R O M}=0.03-0.1 \mathrm{M}$ with a simulation cell (box) size of $4 \times 4 \times 4 \mathrm{~nm}$. For $\mathbf{2 a}, C_{R O M}=0.02-0.1 \mathrm{M}$ with a box size of $6 \times 6 \times 6 \mathrm{~nm}$. For 3a, $C_{R O M}=0.01-0.05 \mathrm{M}$ with a box size of $8 \times 8 \times 8 \mathrm{~nm}$.

Figure S1. Viologen ROM (1a) at $2+$ state of charge and optimal configurations of its HOMO and LUMO orbitals.

Figure S2. Viologen dimer (2a) at 4+ state of charge and optimal configurations of its HOMO and LUMO orbitals.

Figure S3. Viologen trimer (3a) at 6+ state of charge and optimal configurations of its HOMO and LUMO orbitals. LUMO, LUMO+1, and LUMO+2 are nearly degenerate.

The LUMO orbitals are well delocalized over the viologen branches in the highest and lower charge states (not shown). This implies that Coulombic repulsion between branches of viologen dimers and trimers maintains the open molecular structure. We also found no molecular orbital overlap between viologens and solvent ( ACN ) molecules or $\mathrm{PF}_{6}^{-}$ions.

Table S1. Comparison between two charge schemes: GAFF vs. Mulliken charges from ab initio DFT calculations: 1a at two different states of charge

Crossover measurements and analysis

A membrane of known thickness (typically $10-25 \mu \mathrm{~m}$ ) was placed between two halves of an H-cell with an aperture diameter of 1.6 cm and sealed in place with a chemically resistant O-ring. One half of the H-cell (the retentate) was charged with 10 mL of 0.100 M ROM monomer (1a), 0.050 M dimer (2a), or 0.033 M trimer (3a, 3b, or 3c) in electrolyte, while the other half (the permeate) was charged with the same volume of electrolyte with no ROM (or RAO). For viologen-based ROM and RAOs (1a-3a), the salt concentration in the permeate was increased to $0.250,0.225$, and 0.215 M for the monomer, dimer, and trimer experiments, respectively, in order to minimize the initial osmotic pressure difference between the two compartments. Similarly, for acylpyridinium trimer $\mathbf{3 b}$, the salt concentration in the permeate was increased to 0.166 M. Both compartments were stirred to ensure homogeneity. Every $5-60 \mathrm{~min}$, the stirring was stopped and the concentration of ROM or RAO in the permeate was measured electrochemically by acquiring a CV at $100 \mathrm{mV} \mathrm{s}^{-1}$ from -0.40 to -0.85 V (for 1a, 2a, and 3a), -1.00 to -1.70 V (for $\mathbf{3 b}$ ), or 0.30 to 0.75 V (for $\mathbf{3 c}$ ) vs. $\mathrm{Ag} / \mathrm{Ag}^{+}$. The peak cathodic (for 1a, 2a, 3a, and 3b) or anodic (for 3c) current was related to ROM concentration with a calibration curve (Fig. S8 and Table S4). To test the effect of state-of-charge on crossover behavior, a 0.100 M solution of 1a was reduced by bulk electrolysis to -0.65 V vs. $\mathrm{Ag} / \mathrm{Ag}^{+}$and the crossover behavior of the resulting solution was measured in the same way as non-reduced $\mathbf{1 a}$.

Figure S8. Calibration plots for a) viologen monomer (1a), b) reduced viologen monomer (1a), c) viologen dimer (2a), d) viologen trimer (3a), e) acylpyridinium trimer ( $\mathbf{3 b}$ ), and f) DB3 trimer (3c). The black and red lines correspond to the low and high concentration calibration regimes, respectively.

Table S4. Calibration curve parameters and fitting errors for each ROM and RAO

| Molecule | Slope (mA/mM) | Intercept (mM) | $\mathbf{R}^{\mathbf{2}}$ |
| :--- | :---: | :---: | :---: |
| Viologen-based ROM and RAOs |  |  |  |
| 1a (low conc.) | $(-2.77 \pm 0.02) \times 10^{-3}$ | $(0 \pm 2) \times 10^{-5}$ | 0.9993 |
| 1a (high conc.) | $(-2.69 \pm 0.05) \times 10^{-3}$ | $(0 \pm 2) \times 10^{-4}$ | 0.9986 |
| 1a, <br> (leduced <br> low conc.) | $(-2.34 \pm 0.05) \times 10^{-3}$ | $(5 \pm 3) \times 10^{-5}$ | 0.9987 |
| 1a, reduced <br> (high conc.) | $(-1.95 \pm 0.07) \times 10^{-3}$ | $(-4 \pm 1) \times 10^{-4}$ | 0.9943 |
| 2a (low conc.) | $(-5.18 \pm 0.04) \times 10^{-3}$ | $(2 \pm 2) \times 10^{-5}$ | 0.9992 |
| 2a (high conc.) | $(-5.76 \pm 0.05) \times 10^{-3}$ | $(8 \pm 2) \times 10^{-4}$ | 0.9992 |
| 3a (low conc.) | $(-6.85 \pm 0.06) \times 10^{-3}$ | $(2 \pm 3) \times 10^{-5}$ | 0.9993 |
| 3a (high conc.) | $(-7.57 \pm 0.04) \times 10^{-3}$ | $(6 \pm 1) \times 10^{-4}$ | 0.9998 |
| Acylpyridinium-based RAOs |  |  |  |
| 3b (low conc.) | $(-2.46 \pm 0.02) \times 10^{-3}$ | $(-1 \pm 1) \times 10^{-5}$ | 0.9994 |
| 3b (high conc.) | $(-2.34 \pm 0.01) \times 10^{-3}$ | $(-11 \pm 3) \times 10^{-5}$ | 0.9999 |
| DB3-based RAOs |  |  |  |
| 3c (low conc.) | $(5.89 \pm 0.06) \times 10^{-3}$ | $(10 \pm 3) \times 10^{-5}$ | 0.9988 |
| 3c (high conc.) | $(4.14 \pm 0.05) \times 10^{-3}$ | $(20 \pm 2) \times 10^{-4}$ | 0.9991 |

## Calculation of $\boldsymbol{D}_{\text {eff }}$ from crossover measurements

At any moment, the flux of active-species across the membrane $\left(J, \mathrm{~mol} \mathrm{~cm}^{-2} \mathrm{~s}^{-1}\right.$ can be described with Fick's first law:

$$
J=D_{e f f} \frac{\partial C}{\partial x}=D_{\text {eff }} \frac{C_{\text {retentate }}(t)-C_{\text {permeate }}(t)}{l}
$$

Where $C$ is the concentration in $m o \mathrm{~cm}^{-3}$ and $l$ is the membrane thickness in cm . For short times, the difference $C_{\text {retentate }}(t)-C_{\text {permeate }}(t)$ does not change significantly from its initial value of $C_{\text {retentate }}\left(t_{0}\right)-C_{\text {permeate }}\left(t_{0}\right)=C_{0}$, and the flux is constant with time:

$$
J_{t \sim 0}=D_{e f f} \frac{C_{0}}{l}
$$

The concentration of active species in the permeate compartment can be calculated by integrating the flux of active species and dividing by the volume of solution in the permeate compartment:

$$
C_{\text {permeate }}(t)=\frac{A \int_{0}^{t} J(t) d t}{V_{\text {permeate }}}=\frac{D_{\text {eff }} C_{0} A}{l V_{\text {permeate }}} t
$$

By measuring active-species concentration in the permeate compartment and plotting these values as a function of time, the effective diffusion coefficient of the active-species through the membrane can be quantified.

## Limit of quantification

As the salt concentration between the retentate and permeate equalizes, an osmotic pressure difference builds between the two compartments. This induces osmotic flow of solvent from the permeate into the retentate, thus rendering measurements after this time invalid due to competing convection and diffusion in opposite directions. In acetonitrile, this solvent movement was never observed for times $<36$ hours, so the lower limit of quantification for $D_{\text {eff }}$ is set by this time and the minimum quantifiable ROM concentration. In propylene carbonate, this solvent movement wasn't observed even after 1 week, so the lower limit of quantification for $D_{\text {eff }}$ is set by the duration of the experiment.

## Summary of crossover measurements

Figure S9. Measured concentration of ROM or RAO in the permeate compartment as a function of time (points) and linear fits (lines) for a) viologen monomer (1a), b) reduced viologen monomer (1a), c) viologen dimer (2a), d) viologen trimer (3a), e) acylpyridinium trimer (3b), and f) DB3 trimer (3c). Circles represent Celgard (or Daramic for panel e), squares represent native PIM-1, and triangles represent cross-linked PIM-1 membranes. The dashed lines in panels c-e represent the maximum possible crossover rate for each molecule through cross-linked PIM-1 membranes, as none of these experiments surpassed the limit of quantification during the tested time.

Table S5. Measured values for $D_{\text {eff }}$ (in $\mathrm{cm}^{2} \mathrm{~s}^{-1}$ ) for all membrane/RAO pairings. * indicates that $D_{\text {eff }}$ was below the limit of quantification, so the reported value is an upper-bound for $D_{\text {eff }}$. $\dagger$ indicates that the measurement was performed with Daramic instead of Celgard due to poor wetting of Celgard with propylene carbonate.

|  | Celgard | Native PIM-1 | Cross-linked PIM-1 |
| :---: | :---: | :---: | :---: |
| Viologen-based ROM and RAOs |  |  |  |
| Monomer (1a) | $(5.4 \pm 0.4) \times 10^{-7}$ | $(1.3 \pm 0.1) \times 10^{-8}$ | $(1.1 \pm 0.1) \times 10^{-9}$ |
| Monomer, <br> reduced (1a) | - | $(2.2 \pm 0.2) \times 10^{-8}$ | - |
| Dimer (2a) | $(3.1 \pm 0.3) \times 10^{-7}$ | $(9 \pm 1) \times 10^{-10}$ | $3.4 \times 10^{-11} *$ |
| Trimer (3a) | $(2.2 \pm 0.2) \times 10^{-7}$ | $(2.1 \pm 0.3) \times 10^{-10}$ | $8.4 \times 10^{-11 *}$ |
| Acylpyridinium-based RAOs |  |  |  |
| Trimer (3b) | $(2.6 \pm 0.2) \times 10^{-7 \dagger}$ | - | $1.0 \times 10^{-11 *}$ |
| DB3-based RAOs |  |  |  |
| Trimer (3c) | $(3.7 \pm 0.3) \times 10^{-7}$ | - | $(8.1 \pm 0.7) \times 10^{-10}$ |

## Calculation of $\boldsymbol{D}_{\text {sol }}$ for viologen ROM and ROAs 1a-3a

The size and shape of viologen monomer (1a), dimer (2a), and trimer (3a) can be described by the smallest oblate spheroid that encompasses all of the atoms in each relaxed chemical structure. The predicted diffusion coefficient ( $D_{\text {sol }}$ ) of these spheroids can be calculated using a modified form of the Stokes-Einstein equation ${ }^{15}$ that takes into account the non-spherical shape of these molecules, as well as the ratio between solute and solvent size:

$$
D_{\text {sol }}=\frac{k T}{c\left(r_{\text {solv }}, r_{H}\right) f_{s}(a, b) \pi \eta r_{H}}
$$

where $D_{\text {sol }}$ is the molecule's diffusion coefficient in solution in $\mathrm{m}^{2} \mathrm{~s}^{-1}, k$ is the Boltzmann constant, $T$ is the temperature in $\mathrm{K}, c\left(r_{\text {solv }}, r_{H}\right)$ is a correction factor for molecules that are similar in size to the solvent, ${ }^{16} f_{s}(a, b)$ is a correction factor for non-spherical molecules, ${ }^{17}$ $\eta$ is the solvent's viscosity in Poise, and $r_{H}$ is the molecule's hydrodynamic radius in m . For large, spherical molecules, the product $c f_{s}=6$, yielding the Stokes-Einstein equation.

Table S6. Dimensions and volume of the oblate spheroids that encompass the calculated structures of 1a, 2a, and 3a, along with the calculated Stokes-Einstein (assuming spherical shape and small solvent size) and modified Stokes-Einstein (using the known shape and solvent size) diffusion coefficients in acetonitrile.

| Species | $a \operatorname{axis}(\AA)$ | $c$ axis (A) | Volume ( $\AA^{\mathbf{3}}$ ) | $\begin{aligned} & \text { Stokes- } \\ & \text { Einstein } D_{\text {sol }} \\ & \left(\mathrm{cm}^{2} \mathbf{s}^{-1}\right) \end{aligned}$ | Modified StokesEinstein $\boldsymbol{D}_{\text {sol }}$ $\left(\mathrm{cm}^{2} \mathrm{~s}^{-1}\right)$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Monomer (1a) | 3.75 | 6.00 | 353.4 | $1.5 \times 10^{-5}$ | $1.6 \times 10^{-5}$ |
| Dimer (2a) | 4.38 | 12.25 | 984.4 | $1.0 \times 10^{-5}$ | $1.0 \times 10^{-5}$ |
| Trimer (3a) | 12.25 | 3.94 | 2476.6 | $7.6 \times 10^{-6}$ | $7.1 \times 10^{-6}$ |

## Characterization of cross-linked PIM-1 membranes

Figure S10. FT-IR spectra of membranes cast from PIM-1 with 0.1 molar equivalents of cross-linker before (blue, solid) and after (red, dotted) heating at $175{ }^{\circ} \mathrm{C}$ for 7.5 h . Complete disappearance of the azide peak at $2110 \mathrm{~cm}^{-1}$ indicates complete reaction of the cross-linker.

## Membrane ionic conductivity

Membranes with a diameter of 14 mm were soaked in electrolyte and sandwiched between two 12 mm diameter stainless steel electrodes in a Swagelok cell, with the excess membrane folded around one of the electrodes. Electrochemical impedance spectra were acquired on a Biologic VMP3 at a 0 V DC bias and 10 mV AC bias from 200 kHz to 1 kHz . The data were fitted to an equivalent circuit (Fig. S11) with the ECLab software by minimizing the fitting error, $\chi^{2}$ given by $\chi^{2}=\sum_{i} \frac{\left(z_{\text {meas }}\left(f_{i}\right)-z_{f i t}\left(f_{i}\right)\right)^{2}}{\left|z_{\text {meas }}\left(f_{i}\right)\right|}$. The equivalent circuit accounts for the resistance and inductance of the wiring connecting the potentiostat and the conductivity cell, which were measured to be $0.34 \Omega$ and $2.7 \times$ $10^{-6} \mathrm{H}$, respectively. All capacitors were modeled as constant phase elements, which have an impedance given by $Z(f)=\left[Q(j 2 \pi f)^{\alpha}\right]^{-1}$. When $\alpha$ is 0 , the CPE acts as a perfect resistor, and when $\alpha$ is 1 , it acts as a perfect capacitor. For intermediate values of $\alpha$, the CPE acts as a "leaky capacitor." The membrane conductivity was calculated from the membrane resistance using the relation $\sigma=l\left(A R_{M}\right)^{-1}$, where $\sigma$ is the membrane conductivity in $\mathrm{S} \mathrm{cm}^{-1}, l$ is the membrane thickness in $\mathrm{cm}, A$ is the electrode area in $\mathrm{cm}^{2}$, and $R_{M}$ is the membrane resistance in $\Omega$.

Figure S11. Equivalent circuit used to model electrochemical impedance spectra of membranes soaked in electrolyte. $R_{W}$ and $L_{W}$ correspond to the resistance and inductance of the wiring leading from the potentiostat to the conductivity cell, respectively. $Q_{D L}$ and $Q_{M}$ correspond to the double layer and membrane capacitances, and $R_{M}$ corresponds to the ionic resistance of the membrane.

Figure S12. Measured EIS spectra (points) for Celgard (black squares) and cross-linked PIM-1 (red circles) membranes along with fits (lines)

Table S6. Fitting parameters for EIS spectra

| Membrane | Membrane <br> Thickness $(\boldsymbol{\mu m})$ | $\boldsymbol{Q}_{\boldsymbol{D L}}\left(\mathbf{F s}^{\boldsymbol{\alpha}-\mathbf{1}}\right)$ <br> $[\boldsymbol{\alpha}]$ | $\boldsymbol{Q}_{\boldsymbol{M}}\left(\mathbf{F s}^{\boldsymbol{\alpha}-\mathbf{1}}\right)$ <br> $[\boldsymbol{\alpha}]$ | $\boldsymbol{R}_{\boldsymbol{M}} \mathbf{( \boldsymbol { \Omega } )}$ | $\boldsymbol{\sigma}\left(\mathbf{m S ~ c m}^{-\mathbf{1}}\right)$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Celgard <br> $\mathbf{( 3 \times} \times$ | 75 | $11.9 \times 10^{-6}$ <br> $[0.94]$ | $35.5 \times 10^{-9}$ <br> $[1.00]$ | 3.086 | 2.15 |
| Cross- <br> linked <br> PIM-1 (3$\times)$ | 29 | $13.3 \times 10^{-6}$ <br> $[0.93]$ | $10.5 \times 10^{-9}$ <br> $[1.00]$ | 6.371 | 0.40 |
