Figure S-1. Inhibitor treatment did not induce significant DC death. iDC were treated with SB203580 or BAY-117082 (10 μ M). After treatment for 3 hours, the cells were collected for viability detection. 1% DMSO vehicle was used as control. (A) Trypan blue staining was performed to count the percentage of live cells. (B) The percentage of iDC apoptosis was quantified with an annexin V and propidium iodide viability assay.
