## BACKGROUND

[0002] Cereblon (CRBN), a component of the DDBl-CUL4a-Rocl ubiquitin ligase complex, is a molecular target of immunomodulatory agents such as thalidomide, lenalidomide, and pomalidomide. Inhibition of CRBN ubiquitination by these agents may allow CRBN to accumulate, leading to the increased cullin-4 RING E3 ligase-mediated degradation of target proteins.
[0003] The discovery process of CRBN type E3 ligase ligand is related to the study of thalidomide's mechanism of action. In 2010, while studying the toxicity of thalidomide, scientists discovered that cereblon is a binding protein of thalidomide (Science 2010, 327, 1345). Cerebellar protein is part of the E3 ubiquitin ligase protein complex, which acts as a substrate receptor to select ubiquitinated proteins. The study shows that thalidomide-cerebellar protein binding in vivo may be the cause of thalidomide teratogenicity. Subsequent studies found that the compound and related structures can be used as anti-inflammatory agents, anti-angiogenic agents and anti-cancer agents. Lenalidomide and pomalidomide obtained by further modification of the structure of thalidomide have greatly improved their safety and significantly reduced their teratogenic effects. Lenalidomide has been approved by the FDA in 2006 for marketing. Two groundbreaking papers published in Science in 2014 pointed out that lenalidomide works by degrading two special B cell
transcription factors, Ikaros family zinc finger structural proteins 1 and 3 (IKZF1 and IKZF3). The structure of thalidomide may be combined with the E3 ubiquitin ligase protein complex of the cerebellar protein to further play a role in degrading the target protein (Science, 2014, 343, 301; Science, 2014, 343, 305).
[0004] On this basis, CRBN ligands are widely used in protein degradation, and a series of PROTAC molecules based on CRBN ligands have been developed. Due to the influence of CRBN ligand itself on the target point, it may additionally degrade zinc finger domain proteins. Therefore, the design and synthesis of new and highly selective CRBN ligands is also particularly important in the synthesis of PROTAC molecules.

## Biological Assays

[0366] The biological activities of the compounds of the present application can be assessed with methods and assays known in the art.
[0367] The CRBN-DDB1 binding potency of the present disclosure was determined using HTRF assay technology (Perkin Elmer). Compounds are serially diluted and are transferred multi-well plate. The reaction was conducted with addition of His tagged (e.g., CRBN+DDB-DLS7+CXU4) followed by addition of 60 nM fluorescent probe (e.g., Cy5-labeled Thalidomide), and MAb Anti6 HIS Tb cryptate Gold in the assay buffer. After one hour incubation at room temperature, the HTRF signals were read on Envision reader (Perkin Elemer).
[0368] ERa degradative activity of compounds can be assessed in MCF-7 and T47D Cells. MCF7 and T47D cell are seeded and are subsequently treated with the compounds at certain concentrations (e.g., 0.02 to 300 nM ). DMSO can be used as vehicle control. Cells are fixed and are blocked with Intercept (PBS) Blocking Buffer (e.g., Li-COR, Odyssey Blocking Buffer), and are stained with ER (e.g., 1:500, Cell signaling) primary antibody for overnight at cold room. Secondary Antibody (e.g., IRDye 800CW Goat anti-Rabbit IgG) and CellTag 700 Stain are added in Intercept (PBS) Blocking Buffer. Finally, cell plate is placed in incubator to dry. Image and signal were captured on Odyssey® DLx Imaging System.
[0369] In vitro assay can be accompolished by MCF-7 and T47D Cell Titer Glo (CTG) assay. MCF-7 and T47D cell (From HDB) are cultured in multi-well white plate with phenol red-free RPMI1640 $+10 \%$ CS-FBS $+1 \% \mathrm{P} / \mathrm{S}$ medium (e.g., at 1,000 cells/well). On day 0 : Cells were treated with compound at certain concentrations (e.g., 0.5 to 10000 nM ) (DMSO and Staurosporine as control). On day 0 and day 6: add Cell Titer Glo reagent and read on EnVision after 30min incubation for data generation.
[0370] In-cell western blot analysis. Cells are seeded in multi-well plates (e.g., at 40,000 or 10,000 cells/well). Diluted compounds at certain concentration are added (final 0.5\% DMSO) and cells are incubated for certain period of time (e.g., 16 hours). Formaldehyde (e.g., PBS:FA=9:1) is added and followed by washing with PBS. The cells are blocked with Licor blocking buffer (Li-

Cor). The relative ER percentage in treated cells were obtained by comparing the values of treated wells to those in untreated and DMSO-treated wells as $100 \%$.
[0371] Western Blot Analysis. The cells that are treated with the compounds are lysed in Radioimmunoprecipitation Assay Protein Lysis and Extraction Buffer (e.g., $25 \mathrm{mmol} / \mathrm{L}$ Tris. HCl , $\mathrm{pH} 7.6,150 \mathrm{mmol} / \mathrm{L} \mathrm{NaCl}, 1 \%$ Nonidet P-40, $1 \%$ sodium deoxycholate, and $0.1 \%$ sodium dodecyl sulfate) containing proteinase inhibitor cocktail. Equal amounts of total protein are electrophoresed through $10 \%$ SDS-polyacrylamide gels after determination of protein concentration by BCA assay. The separated protein bands were transferred onto PVDF membranes and blotted against different antibodies. The blots are scanned, and the band intensities were quantified (e.g., by using GelQuant.NET software provided by biochemlabsolutions.com). The relative mean intensity of target proteins is expressed after normalization to the intensity of glyceraldehyde-3-phosphate dehydrogenase bands.
[0372] Cell Growth Assay. The cells were seeded at certain concentration (e.g., at 1500/well) in multi-well plates overnight. Cells are subsequently treated with the compounds. A certain period of time (e.g., 4 days) after the compound treatment, $10 \%$ WST- 8 reagent was added to the culture medium and incubate under certain condiction (e.g., in a $\mathrm{CO}_{2}$ incubator at $37^{\circ} \mathrm{C}$ for 2.5 hours). The absorbance is measured on each sample using a microplate reader at certain wavelength (e.g., 450 nm ). The relative absorbance is calculated against the vehicle control from three individually repeats.
In vivo pharmacodynamic and efficacy studies. To develop breast cancer cell line xenografts, mice is given $17 \beta$-Estradiol in drinking water for certain period of time. Certain number (e.g., five million) of cells in $50 \%$ Matrigel are injected subcutaneously into SCID mice to induce tumor formation. When tumors reach certain size (e.g., $100-400 \mathrm{~mm}^{3}$ ), mice are treated with vehicle control (e.g., $5 \%$ DMSO, $10 \%$ solutol, $85 \%$ Water) or the compound, and sacrificed at indicated time points. Tumor tissue is harvested for analysis. Tumor sizes and animal weights were measured 2-3 times per week. Tumor volume $\left(\mathrm{mm}^{3}\right)=($ length $\times$ width 2$) / 2$. Tumor growth inhibition is calculated using TGI $(\%)=(\mathrm{Vc}-\mathrm{Vt}) /(\mathrm{Vc}-\mathrm{Vo}) \times 100$, where $\mathrm{Vc}, \mathrm{Vt}$ are the median of control and treated groups at the end of the study and $\mathrm{V}_{0}$ at the start.

[0449] "Solvate" refers to forms of the compound that are associated with a solvent or water (also referred to as "hydrate"), usually by a solvolysis reaction. This physical association includes hydrogen bonding. Conventional solvents include water, ethanol, acetic acid and the like. The compounds of the invention may be prepared e.g., in crystalline form and may be solvated or hydrated. Suitable solvates include pharmaceutically acceptable solvates, such as hydrates, and further include both stoichiometric solvates and non-stoichiometric solvates. In certain instances, the solvate will be capable of isolation, for example when one or more solvent molecules are incorporated in the crystal lattice of the crystalline solid. "Solvate" encompasses both solutionphase and isolable solvates. Representative solvates include hydrates, ethanolates and methanolates.
[0450] A "subject" to which administration is contemplated includes, but is not limited to, humans (i.e., a male or female of any age group, e.g., a pediatric subject (e.g, infant, child, adolescent) or an adult subject (e.g., young adult, middle aged adult or senior adult) and/or a non-human animal, e.g., a mammal such as primates (e.g., cynomolgus monkeys, rhesus monkeys), cattle, pigs, horses, sheep, goats, rodents, cats, and/or dogs. In certain embodiments, the subject is a human. In certain embodiments, the subject is a non-human animal.
[0451] An "effective amount" means the amount of a compound that, when administered to a subject for treating or preventing a disease, is sufficient to affect such treatment or prevention. The
"effective amount" can vary depending on the compound, the disease and its severity, and the age, weight, etc., of the subject to be treated. A "therapcutically cffective amount" refers to the effective amount for therapeutic treatment. A "prophylatically effective amount" refers to the effective amount for prophylactic treatment.
[0452] "CRBN E3 ubiquitin ligase protein complex" is art recognized and refers to an association of proteins in which CRBN, a 442-amino acid protein, forms a Cullin-4-RING E3 ubiquitin ligase (CRL4) complex and interacts with the adaptor protein damaged DNA-binding protein 1 (DDB1), Cullin-4A (CUL4A), and regulator of cullins 1 (ROC1). Within the CRL4 complex, CRBN acts as a substrate-specificity receptor.
[0453] "Preventing", "prevention" or "prophylactic treatment" refers to a reduction in risk of acquiring or developing a disease or disorder (i.e., causing at least one of the clinical symptoms of the disease not to develop in a subject not yet exposed to a disease-causing agent, or in a subject who is predisposed to the disease in advance of disease onset).
[0454] The term "prophylaxis" is related to "prevention," and refers to a measure or procedure the purpose of which is to prevent, rather than to treat or cure a disease. Non limiting examples of prophylactic measures may include the administration of vaccines; the administration of low molecular weight heparin to hospital patients at risk for thrombosis due, for example, to immobilization, and the administration of an anti-malarial agent such as chloroquine, in advance of a visit to a geographical region where malaria is endemic or the risk of contracting malaria is high.
[0455] "Treating" or "treatment" or "therapeutic treatment" of any disease or disorder refers, in one embodiment, to ameliorating the disease or disorder (i.e., arresting the disease or reducing the manifestation, extent or severity of at least one of the clinical symptoms thereof). In yet another embodiment, "treating" or "treatment" refers to modulating the disease or disorder, either physically, (e.g., stabilization of a discernible symptom), physiologically, (e.g., stabilization of a physical parameter), or both. In a further embodiment, "treating" or "treatment" relates to slowing the progression of the disease.
[0456] It is also to be understood that compounds that have the same molecular formula but differ in the nature or sequence of bonding of their atoms or the arrangement of their atoms in space are
termed "isomers." Isomers that only differ in the arrangement of their atoms in space are termed "stercoisomers."
[0457] Stereoisomers that are not mirror images of one another are termed "diastereomers" and those that are non-superimposable mirror images of each other are termed "enantiomers." When a compound has an asymmetric center, for example, it is bonded to four different groups, a pair of enantiomers is possible. An enantiomer can be characterized by the absolute configuration of its asymmetric center and is described by the R - and S - sequencing rules of Cahn and Prelog, or by the manner in which the molecule rotates the plane of polarized light and designated as dextrorotatory or levorotatory (i.e., as (+)- or (-)- isomers respectively). A chiral compound can exist as either individual enantiomer or as a mixture thereof. A mixture containing equal proportions of the enantiomers is termed a "racemic mixture".
[0458] "Tautomers" refer to compounds that are interchangeable forms of a particular compound structure, and that vary in the displacement of hydrogen atoms and electrons. Thus, two structures may be in equilibrium through the movement of it electrons and an atom (usually H ). For example, enols and ketones are tautomers because they are rapidly interconverted by treatment with either acid or base. Another example of tautomerism is the aci- and nitro-forms of phenylnitromethane, that are likewise formed by treatment with acid or base. Tautomeric forms may be relevant to the attainment of the optimal chemical reactivity and biological activity of a compound of interest.
[0459] As used herein a pure enantiomeric compound is substantially free from other enantiomers or stereoisomers of the compound (i.e., in enantiomeric excess). In other words, an " $S$ " form of the compound is substantially free from the " $R$ " form of the compound and is, thus, in enantiomeric excess of the "R" form. The term "enantiomerically pure" or "pure enantiomer" denotes that the compound comprises more than $95 \%$ by weight, more than $96 \%$ by weight, more than $97 \%$ by weight, more than $98 \%$ by weight, more than $98.5 \%$ by weight, more than $99 \%$ by weight, more than $99.2 \%$ by weight, more than $99.5 \%$ by weight, more than $99.6 \%$ by weight, more than $99.7 \%$ by weight, more than $99.8 \%$ by weight or more than $99.9 \%$ by weight, of the enantiomer. In certain embodiments, the weights are based upon total weight of all enantiomers or stereoisomers of the compound.
[0460] As used herein and unless otherwise indicated, the term "enantiomerically pure (R)compound" refers to at least about $95 \%$ by weight (R)-compound and at most about $5 \%$ by weight (S)-compound, at least about $99 \%$ by weight (R)-compound and at most about $1 \%$ by weight (S)-
compound, or at least about 99.9 \% by weight (R)-compound and at most about $0.1 \%$ by weight (S)-compound. In certain embodiments, the weights are based upon total weight of compound.
[0461] As used herein and unless otherwise indicated, the term "enantiomerically pure (S)compound" refers to at least about $95 \%$ by weight (S)-compound and at most about $5 \%$ by weight (R)-compound, at least about $99 \%$ by weight ( S )-compound and at most about $1 \%$ by weight ( R )compound or at least about $99.9 \%$ by weight ( S )-compound and at most about $0.1 \%$ by weight (R)-compound. In certain embodiments, the weights are based upon total weight of compound.
[0462] In the compositions provided herein, an enantiomerically pure compound or a pharmaceutically acceptable salt, solvate, hydrate or prodrug thereof can be present with other active or inactive ingredients. For example, a pharmaceutical composition comprising enantiomerically pure (R)-compound can comprise, for example, about $90 \%$ excipient and about $10 \%$ enantiomerically pure ( R )-compound. In certain embodiments, the enantiomerically pure ( R )compound in such compositions can, for example, comprise, at least about $95 \%$ by weight (R)compound and at most about 5\% by weight (S)-compound, by total weight of the compound. For example, a pharmaceutical composition comprising enantiomerically pure (S)-compound can comprise, for example, about $90 \%$ excipient and about $10 \%$ enantiomerically pure ( S )-compound. In certain embodiments, the enantiomerically pure (S)-compound in such compositions can, for example, comprise, at least about $95 \%$ by weight (S)-compound and at most about $5 \%$ by weight (R)-compound, by total weight of the compound. In certain embodiments, the active ingredient can be formulated with little or no excipient or carrier.
[0463] Unless indicated otherwise, the description or naming of a particular compound in the specification and claims is intended to include both individual enantiomers and mixtures, racemic or otherwise, thereof. The methods for the determination of stereochemistry and the separation of stereoisomers are well-known in the art.
[0464] The term "about" when referring to a number or a numerical range means that the number or numerical range referred to is an approximation within experimental variability or within statistical experimental error, and thus the number or numerical range, in some instances, will vary between $1 \%$ and $15 \%$ of the stated number or numerical range. In certain embodiments, the number or numerical range vary by $1 \%, 2 \%, 3 \%, 4 \%, 5 \%, 6 \%, 7 \%, 8 \%, 9 \%, 10 \%, 11 \%, 12 \%, 13 \%, 14 \%$, or $15 \%$ of the stated number or numerical range.
[0465] The term "comprising" (and related terms such as "comprise" or "comprises" or "having" or "including") is not intended to exclude that in other certain embodiments, for example, an embodiment of any composition of matter, composition, method, or process, or the like, described herein, "consist of" or "consist essentially of" the described features.
[0466] The phrase "and/or," as used herein in the specification and in the claims, should be understood to mean "either or both" of the elements so conjoined, i.e., elements that are conjunctively present in some cases and disjunctively present in other cases. Multiple elements listed with "and/or" should be construed in the same fashion, i.e., "one or more" of the elements so conjoined. Other elements may optionally be present other than the elements specifically identified by the "and/or" clause, whether related or unrelated to those elements specifically identified. Thus, as a non-limiting example, a reference to "A and/or B", when used in conjunction with open-ended language such as "comprising" may refer, in one embodiment, to A only (optionally including elements other than B); in another embodiment, to B only (optionally including elements other than A); in yet another embodiment, to both A and B (optionally including other elements); etc.
[0467] As used herein in the specification and in the claims, "or" should be understood to have the same meaning as "and/or" as defined above. For example, when separating items in a list, "or" or "and/or" shall be interpreted as being inclusive, i.e., the inclusion of at least one, but also including more than one, of a number or list of elements, and, optionally, additional unlisted items. Only terms clearly indicated to the contrary, such as "only one of" or "exactly one of," or, when used in the claims, "consisting of," will refer to the inclusion of exactly one element of a number or list of elements. In general, the term "or" as used herein shall only be interpreted as indicating exclusive alternatives (i.e., "one or the other but not both") when preceded by terms of exclusivity, such as "either," "one of," "only one of," or "exactly one of." "Consisting essentially of," when used in the claims, shall have its ordinary meaning as used in the field of patent law.
[0468] As used herein in the specification and in the claSmims, the phrase "at least one," in reference to a list of one or more elements, should be understood to mean at least one element selected from any one or more of the elements in the list of elements, but not necessarily including at least one of each and every element specifically listed within the list of elements and not excluding any combinations of elements in the list of elements. This definition also allows that elements may optionally be present other than the elements specifically identified within the list
of elements to which the phrase "at least one" refers, whether related or unrelated to those elements specifically identificd. Thus, as a non-limiting example, "at least one of A and B" (or, equivalently, "at least one of A or B," or, equivalently "at least one of A and/or B") may refer, in one embodiment, to at least one, optionally including more than one, A , with no B present (and optionally including elements other than B); in another embodiment, to at least one, optionally including more than one, B, with no A present (and optionally including elements other than A); in yet another embodiment, to at least one, optionally including more than one, A, and at least one, optionally including more than one, B (and optionally including other elements); etc.

## - Biological Activity of Cereblon Ligands

For Compound A1 to A9
In vitro Assay: $\mathrm{IC}_{50}$ Measurements for binding to CRBN/DDB1
[0567] The binding potency was determined using HTRF assay technology (Perkin Elmer). Compounds were serially diluted in DMSO and $0.2 \mu \mathrm{~L}$ volume was transferred to white 384 -well plate. The reaction was conducted in total volume of $20 \mu \mathrm{~L}$ with addition of 2 nM His tagged CRBN+DDB-DLS7+CXU4 (Wuxi, catalogue \# RP210521GA) to compounds followed by addition of 60 nM Fluorescent probe Cy5-labeled Thalidomide (Tenova Pharma, catalogue \# T52461), and 0.4 nM of MAb Anti-6HIS Tb cryptate Gold (Cisbio, catalogue \# 61HI2TLA in the assay buffer ( 50 mM HEPES pH 7.5, 1 mM TCEP, $0.01 \%$ Brij- $35,50 \mathrm{mM} \mathrm{NaCl}$, and $0.1 \% \mathrm{BSA}$ ). After one hour incubation at room temperature, the HTRF signals were read on Envision reader (Perkin Elemer). Data were analyzed using XLfit using four parameters dose response curve to determine $\mathrm{IC}_{50}$ s and shown in Table E2.

## For Compound B1 to B24

## Cereblon Binding Assay

[0568] The binding to cereblon (CRBN) was determined using the Cereblon Binding Kit (Cisbio, \#64BDCRBNPE(3) following the manufacturer's instruction. Briefly, serially diluted compounds were incubated with GST-tagged wild-type human CRBN protein, XL665-labelled Thalidomide and Europium Cryptate labelled GST antibody at room temperature for about 3 hours. Time Resolved Fluorescence Resonance Energy Transfer (TR-FRET) measurements were acquired on a CALRIOstar plate reader with MARS data analysis software (BMG Labtech), with the following settings: $665 / 10 \mathrm{~nm}$ and $620 / 10 \mathrm{~nm}$ emission, $60 \mu \mathrm{~s}$ delay and $400 \mu$ s integration. The TR-FRET
ratio was taken as the $665 / 620 \mathrm{~nm}$ intensity ratio. The readings were normalized to the control $(0.5 \%)$ and the $\mathrm{IC}_{50}$ was calculated by nonlincar regression (four parameters sigmoid fitted with variable slope) analysis using the GraphPad Prism 8 software.

## Immunoblotting

[0569] Cells were maintained in the appropriate culture medium with $10 \% \mathrm{FBS}$ at $37^{\circ} \mathrm{C}$ and an atmosphere of $5 \% \mathrm{CO} 2$. All the cell lines were used within three months of thawing fresh vials.
[0570] Cells were lysed 1X Cell Lysis Buffer (Cell Signaling Technology, \#9803), resolved by SDS-PAGE NuPAGE gel (Thermo Fisher Scientific), and transferred to a PVDF membrane (Millipore). Membranes were blocked using Odyssey TBS Blocker Buffer (LI-COR). IRDye 680RD and 800CW Dye-labeled secondary antibodies (LI-COR) were used. The washed membranes were scanned using Odyssey CLx imager (LI-COR). The intensity of Western blot signaling was quantitated using the Odyssey software. Primary antibodies used are: Helios (D8W4X) XP® Rabbit mAb (Cell Signaling Technology, \#42427) and GAPDH mouse monoclonal antibody (Santa Cruz Biotechnology, sc-47724).

## IKZF2 HiBiT assay

[0571] Degradation of IKZF2 protein was determined by IKZF2 HiBiT assay using the Jurkat-IKZF2-HiBiT (Promega) cell line. Briefly, cells were seeded in 384-well flat bottom (Corning \#07-201-4423595) at a density of 10,000 cells/well in $20 \mu \mathrm{l}$ of culture medium. Compounds were serially diluted in culture medium, and $20 \mu \mathrm{l}$ of the diluted compounds were added to the appropriate wells of the plate. After the addition of compounds, the cells were incubated at $37^{\circ} \mathrm{C}$ in an atmosphere of 5\% CO2 for 24 hours. At the end of treatment, 40 ul of Nano-Glo HiBiT Lytic Detection Reagent (Promega) was added to each well, and then the plates were incubated at room temperature for 10-20 minutes. The luminescent signal was measured using a CALRIOstar plate reader (BMG Labtech). The readings were normalized to the DMSO -treated cells and the $\mathrm{IC}_{50}$ was calculated by nonlinear regression (four parameters sigmoid fitted with variable slope, least squares fit, and no constraint) analysis using the GraphPad Prism 8 software.

## - Biological Activity of Degraders

[0632] In-cell western blot analysis. a. seed cells in black-sided/clear bottom 96- or 384-well plates at 40,000 or 10,000 cells/well, overnight; b. add diluted compounds (final $0.5 \%$ DMSO), 16 hours. 16 h later, remove medium, add $100 \mu \mathrm{~L}$ or $25 \mu \mathrm{~L}$ of $3.7-4.0 \%$ formaldehyde (PBS:FA=9:1), RT 20 min, no shaking; c. wash with PBS, and permeabilized with $100 \mu \mathrm{~L}$ or $25 \mu \mathrm{~L} /$ well of 1 X PBS $+0.1 \%$ Triton X-100 10 minutes; d. block with $100 \mu \mathrm{~L}$ or $25 \mu \mathrm{~L}$ Licor blocking buffer (LiCor), RT 1h, moderate shaking; d. Add $100 \mu \mathrm{~L}$ or $25 \mu \mathrm{~L}$ of anti-ER (cs-8644, 1:500-1,000) + GAPDH(Millipore MAB374, 1:1000) in Block $+0.05 \%$ Tween 20. RT 2h, gentle shaking. Negative control: cells plus secondary antibodies (no primary antibodies); e. wash x 4 with PBS $+0.05-0.1 \%$ Tween 20, gentel shaking; f. anti-rabbit-680 and anti-mouse-800 (both 1:1000 in LiCor block $+0.05 \%$ Tween20, RT lh, gentle shaking, no light. LI-COR: $0.2 \%$ to reduce background; g. wash x 4 with PBS $+0.05 \%$ Tween 20 , gental shaking; h. add $100 \mu \mathrm{~L}$ or $25 \mu \mathrm{~L}$ of PBS to each well and read on CLX plate reader. The relative ER percentage in treated cells were obtained by comparing the values of treated wells to those in untreated and DMSO-treated wells as $100 \%$.
[0633] Western Blot Analysis. Western blot analysis was performed essentially as described previously. The cells treated with indicated compounds were lysed in Radioimmunoprecipitation Assay Protein Lysis and Extraction Buffer ( $25 \mathrm{mmol} / \mathrm{L}$ Tris.HCl, pH 7.6, $150 \mathrm{mmol} / \mathrm{L} \mathrm{NaCl}, 1 \%$ Nonidet P-40, $1 \%$ sodium deoxycholate, and $0.1 \%$ sodium dodecyl sulfate) containing proteinase inhibitor cocktail (Roche Diagnostics, Mannheim, Germany). Equal amounts of total protein were electrophoresed through $10 \%$ SDS-polyacrylamide gels after determination of protein concentration by BCA assay (Fisher Scientific, Pittsburgh, PA). The separated protein bands were transferred onto PVDF membranes (GE Healthcare Life Sciences, Marlborough, MA) and blotted against different antibodies, as indicated. The blots were scanned, and the band intensities were quantified using GelQuant.NET software provided by biochemlabsolutions.com. The relative mean intensity of target proteins was expressed after normalization to the intensity of glyceraldehyde-3-phosphate dehydrogenase bands.
