

An Ecological Study of Wolf's Bog, Cheboygan County, Michigan¹

RUTH DUTRO, Hagerstown, Ind., and EDITH COHOE, Detroit, Mich.

INTRODUCTION

Wolf's bog has been a subject of ecologic interest, because, although it contains the finest example of subclimax *Thuja* forest in the region, obvious evidence of the beginning of succession to the beach-maple forest, the regional climax, is making headway in it.

LOCATION

Wolf's bog is located in the northern part of sections 13 and 14, Munro township, Cheboygan county, Michigan. It is approximately six miles northeast of the University of Michigan Biological Station, on Douglas Lake. This now lakeless bog covers an area of about 190 acres.

DESCRIPTION

The bog is located in a very evident depression. The last stages of the lake, which was in the northeast edge of the bog, lost its natural vegetation about 1916, when it was transformed into a sawmill pond. When the sawmill was abandoned, vegetation filled in the pond area. At the present time all evidence of this area, with its strictly aquatic plants, has disappeared.

The stream which enters the area at the extreme northeast corner is due to spring floods caused by heavy snows. The stream bed connects with a pond north of the road, and after winding through the climax *Thuja* it branches to such an extent that its course is extremely hard to follow. These anastomosing branches end in the *Salix-Alnus* association south of the *Thuja*. The very evident rise in land at the western and southern boundaries of the bog limit its extent in those directions. Pasture in a cut-over area and a cultivated field also aid in determining the northern boundary. A hardwood forest occupies the ridge on the west, and the Mud Lake Hardwoods connect with the eastern boundary in its central portion.

The land within the bog area has become stabilized. In no place is there found open water surrounded by a quaking mat of vegetation. It follows that only a few species of pioneer bog plants remain, even though there is a great variety of other types of vegetation.

Biotic factors have decidedly influenced the development of Wolf's bog. On the fingerlike projection at the southwestern part of the bog, where *Picea* is the dominant tree, much second growth *Thuja* is found. Investigation revealed that a number of *Picea* trees are being attacked by the mistletoe, *Arceuthobium pusillum*. The presence of dead uncharred *Picea* indicates the same destruction in the past.

A *Larix* cemetery of very tall trees is located south of the *Picea* projection. Since sawfly larvae have destroyed by defoliation most of the *Larix* trees of

Trans. Kansas Acad. Science, Vol. 41, 1938.

1. The work was done under the direction of Dr. F. C. Gates during the 1936 and 1937 summer sessions of the University of Michigan Biological Station.

this region, it is assumed that such destruction likewise occurred in this particular part of Wolf's bog.

The removal of Christmas trees and extensive lumbering have greatly reduced the number of conifers throughout the entire bog. The lumbering operations which began before the time of the sawmill, first removed great amounts of *Thuja*, but the more recent lumbering has taken place in the far southwestern part of the *Picea* projection. Continuation of such lumbering will tend to obliterate this part of the bog forest, because the light conditions of the soil will be different, the effects of wind and precipitation will increase, and the soil structure will change markedly. The existing bog plants, both high and low, will eventually be replaced by the bushes of the adjoining *Salix-Alnus* associations.

After the trees at the southwestern part had been removed by fire, the owner cut remaining trees and bushes to make pasture. As a result, few species of ground plants occur. Certain grasses with underground rhizomes, such as *Agropyrum repens*, will best bear the pasturing. A new community of weeds, including *Amaranthus graecizans*, *Chenopodium album* and *Artemisia annua*, has been established in a field adjoining the southeastern corner of the bog.

The pyric factor has been an important one in the development of the bog. The area has been swept by fire at least three times in the past thirty years. The last and most destructive fire occurred in 1918, when most of the southern part of the climax *Thuja* was destroyed. Many large charred trunks are found throughout the dense growth of *Salix* and *Alnus* which now cover the area where greatest destruction took place.

Depths to sand vary in the different associations of the bog, but in no place is there a great accumulation of humus. The lack of water and the shallow basin account for the greater oxidation of vegetation. In the climax *Thuja* the greatest depth found is 90 centimeters. At a place in the principal east-west path the greatest depth is 60 centimeters. The average depth to sand in the *Thuja* is 35 centimeters. The other extreme is found on the *Prunus* ridge, where sand covers approximately ninety percent of the entire surface.

As shown in table No. 1, data taken with a quinhydrone electric potentiometer, at the place of greatest accumulation of organic material, show the soil to be alkaline from the surface down about 20 cm., below which the reaction is acid.

GENERAL DESCRIPTION OF THE VARIOUS ASSOCIATIONS

(1) THUJA CLIMAX

The densest growth of *Thuja* is found in the lower part of the depression occupied by the bog. Many years ago the *Thuja* forest covered a much larger area. *Thuja* stumps and fallen logs of great circumference are found in all of the bog subareas except that dominated by *Prunus pensylvanica*. This forest contains the largest *Thuja* ever found in the Douglas Lake region. Their diameters range from 60 centimeters to a meter, and the age of one of the largest is estimated to have been approximately four hundred years.

In a count of mature trees the following approximate percentages of species were found: *Thuja occidentalis*, 62; *Tsuga canadensis*, 18; *Acer rubrum*, 14; *Abies balsamea*, 2; *Betula papyrifera* 2; *Sorbus americana*, 2. Results obtained from field work carried on in 1937 shows that this climax *Thuja* is not going to be replaced by young *Thuja* and is therefore entering into a stage of succession. In a series of seven-point observation areas, each consisting of twenty square meters, interesting data concerning comparative density of deciduous and coniferous seedlings were observed. In the dense *Thuja* areas the average density (ground coverage) of seedlings of deciduous trees was over nine times that of seedlings of conifers. (See table No. 2.) This large number of deciduous seedlings and saplings, taken with their healthy condition, is the best evidence of the onset of succession.

The greater part of the bog area is flooded in the spring, and evidences show that this is particularly true in this *Thuja* subarea. The ground surface is covered with hummocks, and the tree needles on its surface are cemented together into huge masses. The presence of *Typha latifolia* and many species of *Carex* are indicatory of this. The fallen logs on which luxuriant growths of mosses occur could hardly have obtained their ample supply of moisture in any way except through flooding.

Very little ground vegetation is found within the forest because of the deep shade cast by the larger *Thuja*. The greatest amount of ground vegetation is found in the lumbering paths and along the stream bed. The species found most commonly with the *Thuja* here include: *Coptis trifolia*, *Galium triflorum*, *Mitella nuda*, *Rubus triflorus*, *Maianthemum canadense*, *Viola pallens*, *Trillium grandiflorum*, *Arisaema triphyllum*, and *Aspidium thelypteris*. The grass found most abundantly in this region is *Brachyelytrum erectum*.

(2) PICEA-ABIES ASSOCIATION

The association dominated by *Picea* and *Abies* is found in the projection located southwest of the climax *Thuja*. The *Thuja* here are not as large nor as abundant as in the first area.

Work carried on in 1937 shows that in this area there are very many more coniferous seedlings than deciduous. It is concluded that this is the part of the bog in which most growth toward the typical high bog forest is taking place.

The ground vegetation is made up of a greater number of species than that of the *Thuja* climax. The explanation is that the ground is not so densely shaded by the smaller *Picea* and *Abies*, and that more moisture is retained

in the ground because of the large quantities of Sphagnum. It is in the paths of this moist area that the rare bog plants are found. Examples of such plants are: *Drosera rotundifolia*, *Cypripedium parviflorum*, *Cypripedium reginae*, *Arethusa bulbosa*, *Listera convallarioides* and *Spiranthes romanzoffiana*.

(3) LARIX ASSOCIATION

The Larix in Wolf's bog is second growth, and has developed since the devastating work of the sawfly larvae in 1916-1918. However, much of the first growth may have been removed by fire, for there are many charred stumps. Larix trees are very shallow rooted, and the loss from windfall may have been great. Only one of the first growth Larix trees remains in this central part. The age of the younger trees averages twenty-five years.

The shrub and tree count showed the following approximate percentages of species: *Larix laricina*, 60; *Populus tremuloides*, 14; *Salix* spp., 10; *Picea mariana*, 6; *Thuja occidentalis*, 6; *Cornus stolonifera*, 2; *Populus balsamifera*, 2. One characteristic of this association is the presence of a great quantity of shrubs and a dense ground cover of a great variety of species. Species of ground vegetation which occur most frequently are: *Botrychium virginianum*, *Chiogenes hispidula*, *Cypripedium parviflorum*, *Eriophorum viridi-carinatum*, *Vaccinium oxycoccus*, *Lycopodium americanum*, *Rubus triflorus*, *Fragaria virginiana*.

MAP 1. Wolf's bog, showing the present-day associations

South of the Picea-Abies projection is a long narrow area which contains many extremely tall dead Larix trunks. All the older living Larix have disappeared. Their destruction has probably been caused by the sawfly larvae. A very dense growth of small Larix is found here. The size of these trees indicate an approximate age of twenty years. These young trees take so much of the ground space that there is little left for other vegetation. This zone gradually changes into a high bog shrub association dominated by *Salix* spp. and *Alnus incana*.

(4) SALIX-ALNUS HIGH BOG SHRUB ASSOCIATION

The high bog shrub association in the area is dominated by *Alnus incana* and various species of *Salix*. It is found in the eastern part of the bog, south and east of the climax *Thuja*, and again south of the Piceas-Abies finger. There is also an extensive area south of the Larix cemetery; this forms an irregular zone paralleling the southern boundary, but in most cases separated from it by an area dominated by *Populus tremuloides*.

Where the *Salix-Alnus* occurs in the eastern part of the bog, two other associations are found quite generally mixed with it. In the more northerly part is much *Populus tremuloides*, and *Larix laricina* is found in the southerly section. Furthermore, charred logs and invading conifers indicate that this particular part of the association is very unstable.

At this place there is a tendency for *Cornus stolonifera* to replace *Alnus* as a dominant with the *Salix*. The shrubs are low; there is abundant sunlight, and a considerable Sphagnum mat to retain the moisture. Such soil and light conditions are conducive to a great variety of species. The close contact with neighboring associations greatly increases that number.

South of the Picea-Abies projection and south of the Larix cemetery the shrubs form such dense clumps that passage through this area is very difficult. Many small trees of *Picea*, *Larix* and *Thuja* are present. The *Salix* and *Alnus* are taller than those in the part of the association discussed above, and so close together that the ground is densely shaded. The straggly appearance of the ground plants indicates the need for more light, if they are to survive.

A count of trees and shrubs showed the following approximate percentages: *Alnus incana*, 50; *Salix* sp., 34; *Betula papyrifera*, 10; *Abies balsamea*, 4; *Populus tremuloides*, 2. The following species of ground plants found quite generally are: *Typha latifolia*, *Maianthemum canadense*, *Fragaria virginiana*, *Eupatorium purpureum*, *Cirsium arvense*, *Solidago* sp., *Aralia nudicaulis*, *Viola canadensis*, *Coptis trifolia*, *Clintonia borealis*, *Ledum groenlandicum*, *Eriophorum viridi-carinatum* and *Rubus strigosus*.

(5) POPULUS TREMULOIDES ASSOCIATION

Associations in which *Populus tremuloides* dominates are found irregularly distributed within the bog. The part of the *Populus tremuloides* adjoining the northern climax *Thuja* and extending to the meadow on the east is the most representative. The charred and cut logs show this to be a secondary association caused by the destruction of fire and lumbering in a *Thuja* association. The disturbing factor evidently ended suddenly, for just across the path from the northern edge of the *Populus tremuloides* is the old climax *Thuja* association.

The trees at this particular place, as is true of the aspens in Wolf's bog, are medium sized or small. A tree count gives the following approximate percentages: *Salix* spp., 40; *Populus tremuloides*, 36; *Betula papyrifera*, 12; *Alnus incana*, 4; *Picea mariana*, 4; *Abies balsamea* 2; *Acer rubrum*, 2.

The invasion of the area by the Mud Lake hardwoods from the south and east is shown by an increasing number of seedlings and saplings of *Acer saccharum* and *Tilia americana*. Then coniferous seedlings and saplings from the *Thuja* association at the north and west have also invaded this area. In addition to the invading plants from these two associations, there are also invaders from the *Salix-Alnus* association and from the nearby pasture. The ground vegetation consequently includes a mixture of species, including: *Pteris aquilina*, *Hieracium aurantiacum*, *Epilobium angustifolium*, *Aralia nudicaulis*, *Lactuca canadensis*, *Trifolium repens*, *Fragaria virginiana*, *Gaultheria procumbens*, *Achillea millefolium*, and *Rumex acetosella*.

(6) PRUNUS PENNSYLVANICA ASSOCIATION

The prunus association is located on an oval shaped sandy east-west ridge about 400 meters wide and 900 meters long. Its presence is due to glacial deposition. The presence of charred logs indicates that it did not escape the ravages of fire.

The small amount of ground vegetation supported by the sandy soil is stunted or dying. None of the prunus trees exceed a height of 10 meters. A tree count gives the following approximate percentages: *Prunus pennsylvanica*, 86; *Acer rubrum*, 12; *Picea mariana*, 2. The following ground plants are found: *Epilobium angustifolium*, *Fragaria virginiana*, *Phleum pratense*, *Dierilla lonicera*, *Hieracium aurantiacum*, *Verbascum thapsus* and *Pteris aquilina*. Mosses of the genera *Ceratodon* and *Polytrichum* form a brownish cover over much of the ground surface.

There seems to be an invasion from the west of young *Larix* and *Picea mariana*, but their growth will probably be not extensive because of the elevation of the area.

SUMMARY

1. Wolf's bog, a tree-covered lakeless area in Cheboygan county, Michigan, exhibits six types of vegetation: (1) *Thuja*, the climax forest, found in the deepest part of the depression; (2) *Picea-Abies*, which extends over a slightly higher area; (3) *Larix*, which forms a second growth area where the plant successions have been most disturbed; (4) High bog shrub, dominated by *Salix* and *Alnus*, which forms an intermedial zone between the *Populus tremuloides* area and the *Thuja*; (5) *Populus tremuloides*, on the clayey elevations; (6) *Prunus pennsylvanica*, on a sandy ridge.

2. Fires have swept over parts of the area several times in the last thirty years. Lumbering, attacks of the sawfly larvae, and the growth of the mistletoe, *Arceuthobium pusillum*, are important factors in producing the present stage of bog development in the area studied.

3. Approximately 270 species of plants, representing 54 families of Spermatophytes, 3 of Pteridophytes and 18 of Bryophytes, have been collected.

4. It seems evident from the appearance of many seedlings, saplings and occasional tree representatives of the beech-maple plant association within the climax *Thuja* that the successional tendency is toward the beech-maple forest.

Tree Count taken in Climax Thuja - 1929

<i>Abies balsamea</i>	80
<i>Acer rubrum</i>	5
<i>Acer saccharum</i>	8
<i>Acer spicatum</i>	46
<i>Alnus incana</i>	14
<i>Amelanchier canadensis</i>	1
<i>Betula papyrifera</i>	50
<i>Cornus</i> sp.	1
<i>Fagus grandifolia</i>	3
<i>Fraxinus nigra</i>	86
<i>Larix laricina</i>	2
<i>Picea canadensis</i>	18
<i>Picea mariana</i>	10
<i>Populus tremuloides</i>	1
<i>Salix discolor & rostrata</i>	1
<i>Sorbus americana</i>	12
<i>Thuja occidentalis</i>	400
<i>Tilia americana</i>	1
<i>Tsuga canadensis</i>	22
<i>Ulmus americana</i>	6

GROUND PLANTS IN CLIMAX THUJA - 100 Quadrats - 1929

	Species	Frequency
1.	<i>A bies balsamea</i>	17
2.	<i>Acer rubrum</i>	4
3.	<i>A cer saccharum</i>	2
4.	<i>Acer spicatum</i>	27
5.	<i>Actaea rubra</i>	5
6.	<i>Alnus incana</i>	3
7.	<i>Amelanchier spicata</i>	1
8.	<i>Aralia nudicaulis</i>	12
9.	<i>Arisaema triphyllum</i>	2
10.	<i>Aspidium spinulosum</i>	2
11.	<i>Aspidium thelypteris</i>	17
12.	<i>Aster laevis</i>	1
13.	<i>Aster novae-angliae</i>	2
14.	<i>Aster puniceus</i>	1

64. <i>Trillium grandiflorum</i>	6
65. <i>Tsuga canadensis</i>	14
66. <i>Viburnum cassinoides</i>	1
67. <i>Viola pallens</i>	51

List of Species Found by Ecology Class (1956)
in Larix Association - Wolf's Bog

1. *Aster lindleyanus*
2. *Botrychium virginianum*
3. *Calamagrostis canadensis*
4. *Carex leptalea*
5. *Carex trisperma*
6. *Chiogenes hispida*
7. *Clintonia borealis*
8. *Cornus canadensis*
9. *Cornus stolonifera*
10. *Epilobium angustifolium*
11. *Epigaea repens*
12. *Eriophorum viridi-carinatum*
13. *Fragaria virginiana*
14. *Galium triflorum*
15. *Gaultheria procumbens*
16. *Larix laricina*
17. *Ledum groenlandicum*
18. *Linnaea borealis*
19. *Lycopus americanus*
20. *Mitella nuda*
21. *Picea mariana*
22. *Polytrichum sp.*
23. *Populus tremuloides*
24. *Rubus triflorus*
25. *Salix discolor*
26. *Salix rostrata*
27. *Sphagnum sp.*
28. *Solidago sp.*
29. *Taraxacum officinale*
30. *Thuja occidentalis*
31. *Trientalis americana*
32. *Vaccinium canadense*
33. *Vaccinium oxycoccus*

Results of Tree Counts Taken in Each Plant AssociationWolf's Bog - 1936

<u>Plant Association</u>	<u>Species</u>	<u>No.</u>	<u>Percentag</u>
I. Thuja	<i>Abies balsamea</i>	1	2
	<i>Acer rubrum</i>	7	14
	<i>Betula papyrifera</i>	1	2
	<i>Sorbus americana</i>	1	2
	<i>Thuja occidentalis</i>	31	52
	<i>Tsuga canadensis</i>	9	18
II. Larix laricina	<i>Cornus stolonifera</i>	1	2
	<i>Larix laricina</i>	30	60
	<i>Picea mariana</i>	5	6
	<i>Populus balsamifera</i>	1	2
	<i>Populus tremuloides</i>	7	14
	<i>Salix sp.</i>	5	10
	<i>Thuja occidentalis</i>	3	6
III. Salix-Alnus	<i>Abies balsamea</i>	2	4
	<i>Alnus incana</i>	25	50
	<i>Betula papyrifera</i>	5	10
	<i>Populus tremuloides</i>	1	2
	<i>Salix sp.</i>	17	34
IV. Populus tremuloides	<i>Abies balsamea (small)</i>	1	2
	<i>Acer rubrum</i>	1	2
	<i>Betula papyrifera</i>	6	12
	<i>Picea mariana</i>	2	4
	<i>Populus tremuloides</i>	18	36
	<i>Salix sp.</i>	20	40
	<i>Sorbus americana</i>	2	4
V. Prunus pensylvanica	<i>Acer rubrum</i>	0	12
	<i>Picea mariana</i>	1	2
	<i>Prunus pensylvanica</i>	43	86

Results of Testing the Soil Found in Plant Associations
of Wolf's Bog - 1936

1. In Populus tremuloides association: - pH value of soil at surface is 4.
2. In Prunus association: - pH value of soil at surface is 5.
3. In Salix-Alnus association: - pH value of soil at surface is 7.
4. In Larix association: - pH value of soil at surface is 8.
5. In Thuja association where ground vegetation is lacking: - pH value of soil at surface is 8.
6. In Thuja association where best sample of peat was obtained:-
pH value (1) at surface is 8.5
(2) at depth of 10 cm. is 8.0
(3) at depth of 20 cm. is 7.5
(4) at depth of 30 cm. is 7.0
(5) at depth of 40 cm. is 6.5
(6) at depth of 50 cm. is 5.0
7. Water found in path in Thuja-Picea projection: - pH value is 8.

Annotated List of Plant Species Found in Wolf's Bog During the 1936 Session
of the University of Michigan Biological Station

Family	Species	Collection Number	Occurrence
Aceraceae	<i>Acer rubrum</i>	1	common
	<i>Acer saccharum</i>	2	rare
	<i>Acer spicatum</i>	3	common
Amaranthaceae	<i>Amaranthus graecizans</i>	4	rare
Anacardiaceae	<i>Rhus glabra borealis</i>	11	infrequent
	<i>Rhus toxicodendron</i>	12	rare
Apocynaceae	<i>Apocynum androsaemifolium</i>	5	infrequent
Aquifoliaceae	<i>Ilex verticillata</i>	6	frequent
	<i>Nemopanthus mucronata</i>	7	common
Araceae	<i>Arisaema triphyllum</i>	8	common
Araliaceae	<i>Aralia hispida</i>	9	infrequent
	<i>Aralia nudicaulis</i>	10	abundant
Asclepiadaceae	<i>Asclepias incarnata</i>	13	abundant
	<i>Asclepias syriaca</i>	14	infrequent
Balsaminaceae	<i>Impatiens biflora</i>	15	common
Betulaceae	<i>Alnus incana</i>	16	abundant
	<i>Betula lutea</i>	17	found once
	<i>Betula papyrifera</i>	18	frequent
	<i>Ostrya virginiana</i>	19	found once
Boraginaceae	<i>Cynoglossum officinale</i>	20	rare
Campanulaceae	<i>Campanula aparanooides</i>	21	frequent
Caprifoliaceae	<i>Diervilla lonicera</i>	22	frequent
	<i>Linnaea borealis</i> var. <i>americana</i>	23	abundant
	<i>Lonicera canadensis</i>	24	infrequent
	<i>Lonicera dioica</i>	25	frequent
	<i>Lonicera hirsuta</i>	26	infrequent
	<i>Lonicera oblongifolia</i>	27	infrequent
	<i>Sambucus racemosa</i>	28	frequent
	<i>Viburnum cassinoides</i>	29	common
	<i>Viburnum opulus</i>	30	infrequent
Caryophyllaceae	<i>Arenaria serpyllifolia</i>	31	infrequent
	<i>Cerastium vulgatum</i>	32	infrequent
	<i>Lychnis alba</i>	33	infrequent
	<i>Saponaria officinalis</i>	34	frequent
	<i>Silene latifolia</i>	35	infrequent
	<i>Stellaria longifolia</i>	36	found once
	<i>Chenopodium album</i>	37	infrequent

Family	Species	Collection Number	Occurrence
Compositae	<i>Achillea millefolium</i>	38	frequent
	<i>Ambrosia artemesifolia</i>	39	infrequent
	<i>Anaphalis margaritacea</i>	40	common
	<i>Antennaria neocloioica</i>	41	common
	<i>Artemesia biennis</i>	42	infrequent
	<i>Aster lateriflorus</i> var. <i>hisuticaulis</i>	45	frequent
	<i>Aster lindleyanus</i>	46	common
	<i>Aster macrophyllus</i>	47	infrequent
	<i>Aster novae-angliae</i>	48	frequent
	<i>Aster paniculatus</i>	44	frequent
	<i>Aster sagittifilius</i>	51	infrequent
	<i>Aster salicifolius</i>	52	frequent
	<i>Aster sp.</i>	49	common
	<i>Aster sp.</i>	50	infrequent
	<i>Chrysanthemum leucanthemum</i> var. <i>pinnatifidum</i>	53	infrequent
	<i>Cirsium arvense</i>	54	frequent
	<i>Cirsium lanceolatum</i>	55	common
	<i>Cirsium muticum</i>	56	infrequent
	<i>Erigeron annuus</i>	57	frequent
	<i>Erigeron canauensis</i>	58	frequent
	<i>Erigeron philadelphicus</i>	59	infrequent
	<i>Erigeron strigosus</i>	61	infrequent
	<i>Erigeron sp.</i>	60	infrequent
	<i>Eupatorium perfoliatum</i>	62	common
	<i>Eupatorium purpureum</i>	63	common
	<i>Gnaphalium decurrens</i>	64	common
	<i>Gnaphalium uliginosum</i>	65	infrequent
	<i>Hieracium aurantiacum</i>	66	frequent
	<i>hieracium sp.</i>	66	found once
	<i>Lactuca canadensis</i>	67	common
	<i>Lactuca pulchella</i>	68	infrequent
	<i>Lactuca spicata</i>	69	frequent
	<i>Petasites palmatus</i>	70	common
	<i>Rubbeckia hirta</i>	71	frequent
	<i>Senecio balsamita</i>	72	infrequent
	<i>Senecio sp.</i>	73	found once
	<i>Solidago canauensis</i>	75	common
	<i>Solidago graminifolia</i>	76	common
	<i>Solidago rugosa</i>	78	common
	<i>Solidago sp.</i>	74	infrequent
	<i>Solidago sp.</i>	77	infrequent
	<i>Taraxacum officinale</i>	79	frequent
Cornaceae	<i>Cornus canauensis</i>	81	abundant
	<i>Cornus circinata</i>	82	infrequent
	<i>Cornus stolonifera</i>	83	abundant
Cruciferae	<i>Brassica arvensis</i>	84	infrequent
	<i>Capsella bursa-pastoris</i>	85	infrequent
	<i>Cardamine pensylvanica</i>	86	frequent
	<i>Erysimum cheiranthoides</i>	87	infrequent
	<i>Lepidium virginicum</i>	88	infrequent
	<i>Radicula palustris</i> var. <i>hispia</i>	89	infrequent

Family	Species	Collection Number	Occurrence
Cyperaceae	<i>Carex arctata</i>	90	infrequent
	<i>Carex aurea</i>	91	infrequent
	<i>Carex flava</i>	93	common
	<i>Carex gracillima</i>	94	frequent
	<i>Carex hystericina</i>	96	
	<i>Carex intumescens</i>	95	common
	<i>Carex laxiflora</i>	97	frequent
	<i>Carex leptalea</i>	98	frequent
	<i>Carex paupercula</i>	29	frequent
	<i>Carex rosea</i>	99	common
	<i>Carex stipata</i>	100	common
	<i>Carex sp.</i>	135	frequent
	<i>Eleocharis palustris</i>	101	frequent
	<i>Eriophorum viride-carinatum</i>	103	common
	<i>Scirpus atrocinatus</i>	104	common
	<i>Scirpus atrovirens</i>	105	common
	<i>Scirpus cyperinus</i>	106	common
Droseraceae	<i>Drosera rotundifolia</i>	108	infrequent
Equisetaceae	<i>Equisetum arvense</i>	109	common
	<i>Equisetum palustre</i>	110	infrequent
	<i>Equisetum sylvaticum</i>	111	common
Ericaceae	<i>Chiogenes hispidula</i>	112	common
	<i>Epigaea repens</i>	113	frequent
	<i>Gaultheria procumbens</i>	114	abundant
	<i>Ledum groenlandicum</i>	115	abundant
	<i>Mitchella repens</i>	116	frequent
	<i>Moneses uniflora</i>	117	infrequent
	<i>Pyrrola americana</i>	118	infrequent
	<i>Pyrola asarifolia</i>	119	frequent
	<i>Pyrola asarifolia</i> var. <i>incarnata</i>	121	frequent
	<i>Pyrola elliptica</i>	120	infrequent
	<i>Vaccinium canadense</i>	122	common
	<i>Vaccinium oxycoccus</i>	123	common
	<i>Vaccinium pensylvanicum</i>	124	infrequent
Euphorbiaceae	<i>Euphorbia serpyllifolia</i>	199	rare
Fagaceae	<i>Fagus grandifolia</i>	125	frequent
Geraniaceae	<i>Geranium robertianum</i>	126	found once
Gramineae	<i>Agropyron repens</i>	127	
	<i>Agrostis alba</i>	129	common
	<i>Agrostis capillaris</i>	128	frequent
	<i>Brachyelytrum erectum</i>	131	frequent
	<i>Bromus ciliatus</i>	130	abundant
	<i>Calamagrostis canadensis</i>	133	common
	<i>Cinna latifolia</i>	134	common
	<i>Glyceria nervata</i>	136	common
	<i>Muhlenbergia mexicana</i>	137	frequent
	<i>Phleum pratense</i>	138	frequent
	<i>Poa pratensis</i>	139	common
			frequent
Iridaceae	<i>Iris versicolor</i>	140	frequent

Family	Species	Collection Number	Occurrence
Juncaceae	<i>Juncus effusus</i>	141	common
	<i>Juncus tenuis</i>	142	infrequent
Labiatae	<i>Lycopus americanus</i>	143	common
	<i>Lycopus uniflorus</i>	144	common
	<i>Mentha arvensis</i>	145	infrequent
	<i>Mentha spicata</i>	146	frequent
	<i>Nepeta cataria</i>	147	infrequent
	<i>Prunella vulgaris</i>	148	common
	<i>Satureja vulgaris</i>	149	infrequent
	<i>Scutellaria galericulata</i>	150	common
	<i>Scutellaria lateriflora</i>	151	common
Leguminosae	<i>Stachys palustris</i>	152	infrequent
	<i>Lathyrus palustris</i>	153	frequent
	<i>Medicago sativa</i>	154	infrequent
	<i>Trifolium agrarium</i>	156	rare
	<i>Trifolium hybridum</i>	157	common
	<i>Trifolium pratense</i>	158	infrequent
	<i>Trifolium repens</i>	159	common
	<i>Melilotus alba</i>	155	frequent
Liliaceae	<i>Clintonia borealis</i>	160	abundant
	<i>Lilium philadelphicum</i>		
	var. <i>andinum</i>	161	common
	<i>Maianthemum canadense</i>	162	abundant
	<i>Polygonatum biflorum</i>	163	common
	<i>Smilacina racemosa</i>	164	common
	<i>Streptopus amplexifolius</i>	165	frequent
	<i>Trillium grandiflorum</i>	167	frequent
	<i>Uvularia grandiflora</i>	166	common
Lycopodiaceae	<i>Zygadenus chloranthus</i>	168	infrequent
	<i>Lycopodium annotinum</i>	169	frequent
	<i>Lycopodium obscurum</i>		
	var. <i>dendroideum</i>	170	infrequent
Oleaceae	<i>Fraxinus nigra</i>	171	common
Onagraceae	<i>Circaeа alpina</i>	172	common
	<i>Circaeа intermedia</i>	173	rare
	<i>Circaeа lutetiana</i>	174	frequent
	<i>Epilobium adenocaulon</i>	175	frequent
	<i>Epilobium angustifolium</i>	176	abundant
	<i>Epilobium densum</i>	177	frequent
	<i>Oenothera muricata</i>	178	infrequent
Orchidaceae	<i>Arethusa bulbosa</i>	179	rare
	<i>Cypripedium hirsutum</i>	181	common
	<i>Cypripedium parviflorum</i>	180	frequent
	<i>Habenaria hyperborea</i>	182	common
	<i>Leparis loeslii</i>	183	rare
	<i>Listera convallaroides</i>	184	frequent
	<i>Spiranthes romanzoffiana</i>	185	infrequent

Family	Species	Collection Number	Occurrence
Pinaceae	<i>Abies balsamea</i>	186	abundant
	<i>Larix laricina</i>	187	abundant
	<i>Picea canadensis</i>	188	abundant
	<i>Picea mariana</i>	189	abundant
	<i>Pinus strobus</i>	190	infrequent
	<i>Taxus canadensis</i>	191	common
	<i>Thuja occidentalis</i>	192	abundant
	<i>Tsuga canadensis</i>	193	abundant
Plantaginaceae	<i>Plantago lanceolata</i>	194	found once
	<i>Plantago major</i>	195	infrequent
Polygalaceae	<i>Polygala pauciflora</i>	196	frequent
Polygonaceae	<i>Polygonum ciliinode</i>	197	infrequent
	<i>Polygonum convolvulus</i>	198	frequent
	<i>Polygonum persicaria</i>	201	rare
	<i>Polygonum sp.</i>	200	rare
	<i>Rumex acetosella</i>	202	frequent
	<i>Rumex crispus</i>	203	infrequent
	<i>Rumex obtusifolius</i>	204	common
Polypodiaceae	<i>Adiantum pedatum</i>	206	infrequent
	<i>Aspidium cristatum</i>	207	abundant
	<i>Aspidium spinulosum</i>	209	common
	<i>Aspidium thelypteris</i>	210	abundant
	<i>Aspidium sp.</i>	208	frequent
	<i>Asplenium filix-femina</i>	211	frequent
	<i>Athyrium angustifolium</i>	212	infrequent
	<i>Botrychium virginianum</i>	213	frequent
	<i>Cystopteris fragilis</i>	218	infrequent
	<i>Onoclea sensibilis</i>	214	common
	<i>Osmunda regalis</i>	215	common
	<i>Phragopteris dryopteris</i>	216	common
	<i>Pteris aquilina</i>	217	abundant
Primulaceae	<i>Trientalis americana</i>	219	common
Ranunculaceae	<i>Actaea alba</i>	220	common
	<i>Actaea rubra</i>	221	common
	<i>Anemone canadensis</i>	222	frequent
	<i>Caltha palustris</i>	223	frequent
	<i>Clematis virginiana</i>	224	common
	<i>Coptis trifolia</i>	225	abundant
	<i>Ranunculus acris</i>	226	common
	<i>Ranunculus recurvatus</i>	227	common
	<i>Ranunculus sceleratus</i>	228	frequent
Rhamnaceae	<i>Rhamnus alnifolia</i>	229	common
Rosaceae	<i>Agrimonia gryposepala</i>	230	frequent
	<i>Amelanchier canadensis</i>	231	common
	<i>Fragaria virginiana</i>	232	abundant
	<i>Geum rivale</i>	236	common
	<i>Geum strictum</i>	233	frequent
	<i>Geum sp.</i>	234	found once

Family	Species	Collection Number	Occurrence
Rosaceae	<i>Potentilla monspeliensis</i>	235	common
	<i>Potentilla recta</i>	237	frequent
	<i>Prunus pennsylvanica</i>	238	abundant
	<i>Pyrus malus</i> var. <i>sylvestris</i>	239	rare
	<i>Rosa</i> sp.	240	found once
	<i>Rosa</i> sp.	241	found once
	<i>Rubus idaeus</i>	243	frequent
	var. <i>aculeatissimus</i>		
	<i>Rubus occidentalis</i>	244	infrequent
	<i>Rubus triflorus</i>	245	abundant
	<i>Rubus villosus</i>	242	common
	<i>Sorbus americana</i>	246	frequent
	<i>Spiraea latifolia</i>	247	infrequent
Rubiaceae	<i>Galium triflorum</i>	248	abundant
Salicaceae	<i>Populus balsamifera</i>	249	frequent
	<i>Populus grandidentata</i>	250	frequent
	<i>Populus tremuloides</i>	251	abundant
	<i>Salix discolor</i>	252	abundant
	<i>Salix rostrata</i>	253	abundant
	<i>Salix serissima</i>	254	common
Saxifragaceae	<i>Mitella nuda</i>	257	common
	<i>Ribes</i> (hybrida)	259	rare
	<i>Ribes lacustre</i>	260	frequent
	<i>Ribes</i> sp.	258	rare
	<i>Ribes</i> sp.	261	rare
Scrophulariaceae	<i>Castilleja coccinea</i>	262	rare
	<i>Verbascum thapsus</i>	263	frequent
Solanaceae	<i>Solanum nigrum</i>	264	rare
Tiliaceae	<i>Tilia americana</i>	265	infrequent
Typhaceae	<i>Typha latifolia</i>	266	frequent
Umbelliferae	<i>Daucus carota</i>	267	infrequent
	<i>Pastinaca sativa</i>	268	frequent
	<i>Sanicula marilandica</i>	269	infrequent
Urticaceae	<i>Ulmus americana</i>	270	frequent
Valerianaceae	<i>Valeriana uliginosa</i>	271	frequent
Verbenaceae	<i>Verbena stricta</i>	272	infrequent
Violaceae	<i>Viola canadensis</i>	273	common
	<i>Viola pallens</i>	275	rare
	<i>Viola renifolia</i>	276	infrequent
	<i>Viola</i> sp.	274	frequent

Cheboygan Co. Mich

Herbarium List of Plants Collected in Wolf's Bog During the

University of Michigan Summer Session, 1936.

Ruth Dutro and Edith Copher

No.	Name of Species	Plant Association	Month
1.	Acer rubrum	T	July
2.	Acer saccharum	T	July
3.	Acer spicatum	S	July
4.	Amaranthus graecizans	W.	August
