UMRI Project 02688

Under Contract With:

U.S. Army Snow, Ice and Permafrost Research Establishment  
Corps of Engineers  
1215 Washington Avenue  
Wilmette, Illinois

Administered by:

THE UNIVERSITY OF MICHIGAN RESEARCH INSTITUTE ANN ARBOR

January 1960

## PREFACE

The data given in this report were processed and tabulated as part of the requirement in Contract Number DA-11-190-ENG-30 with the U.S. Army Snow, Ice and Permafrost Research Establishment, Corps of Engineers. Work on the contract included, in addition, (1) an analysis of micrometeorological and related data on heat transfer processes of a snow cover, and (2) participation in the data collection program for the snow seasons 1957-58 and 1958-59. The results of the analysis and an account of the field participation are reported in Part II of the Final Report.

The overall effort on the contract was directed toward evaluating heat transfer between a snow cover and its environment in order to predict physical snow cover characteristics from meteorological information.

## DESCRIPTION OF DATA

### 1. Location and Periods of Measurement

Measurements of radiative fluxes over snow were made at the U.S. Army Keweenaw Field Station, Houghton, Michigan,  $47^{\circ}11'N$ ,  $88^{\circ}33'W$ . The station is 1090 feet above sea level and about 500 feet above the level of Lake Superior, which is six miles to the northwest. The terrain within a 100 yard radius of the measurement site was level and obstructionless.

For the two snow seasons under investigation, continuous measurements of radiative fluxes were obtained from 12 January 1955 through 14 April 1955 and from 10 January 1956 through 4 March 1956.

### 2. Instrumentation

Incident and reflected solar radiation fluxes were measured with Eppley pyrheliometers mounted about 3 meters above the ground. The thermopile outputs of both pyrheliometers were continuously recorded by potentiometers calibrated to record units of solar radiation directly in terms of langleys per minute ( $\text{gram cal cm}^{-2} \text{ min}^{-1}$ ). Reference is made to articles by Hand (1) and Fuquay and Buettner (2) for detailed descriptions and performance characteristics of Eppley pyrheliometers.

Total hemispherical radiation, consisting of short wave direct and diffuse solar and long-wave atmospheric radiation incident upon a plane surface, was measured with an aspirated Gier and Dunkle total hemispherical radiometer.

Net radiation exchange, consisting of the difference between total hemispherical radiation and reflected solar, reflected atmospheric, and long wave terrestrial radiation emitted by the snow, was measured with a Gier and Dunkle aspirated net-exchange radiometer. Both radiometers were mounted about 3 meters above the ground surface and their thermopile outputs were continuously recorded by recording potentiometers. Reference is made to papers by Gier and Dunkle (3) and by Dunkle and others (4) for a description of the construction and operation of the radiometers.

### 3. Data Processing

The collected data were abstracted from the recorder strip charts partly by personnel from the Snow, Ice and Permafrost Research Establishment and partly by personnel from the University of Michigan meteorological laboratories. The completed abstracted data received from SIPRE were inspected and all detectable errors were corrected. A common visual-manual method of abstracting the data was used. It consisted of evaluating fifteen minute, half hourly, or hourly averages of each radiative flux. Instrument calibration factors and corrections were applied to all abstracted values of total and net radiation. Data processing was completed by computing hourly totals of each radiative flux in terms of the number of langleys received for the indicated hour ending, and finally by computing daily totals of each radiative flux.

### 4. Explanation of Tables

Each page includes four 24-hour days of tabulated data of incoming solar,

reflected solar, total hemispherical and net exchange radiation. Totals are given for each hour ending at the time indicated (langleys/hr) and for each 24-hour day ending at midnight (langleys/day) to the nearest tenth of a langley. The tables cover the period from 12 January 1955 through 31 March 1955 and from 10 January 1956 through 4 March 1956.
