General Procedures

NMR spectra were obtained on a Varian vnmrs 700 (699.76 MHz for ^1H ; 175.95 MHz for ^{13}C), a Varian Inova 400 (399.96 MHz for ^1H ; 376.34 MHz for ^{19}F ; 100.57 MHz for ^{13}C), a Varian vnmr500 (500.09 MHz for ^1H ; 470.56 MHz for ^{19}F ; 125.75 MHz for ^{13}C), or a Varion MR400 (400.53 MHz for ^1H ; 376.87 MHz for ^{19}F ; 100.71 MHz for ^{13}C) spectrometer. ^1H , ^{19}F and ^{13}C chemical shifts are reported in parts per million (ppm) relative to TMS, with the residual solvent peak used as an internal reference. ^{19}F NMR spectra are referenced on a unified scale, where the single primary reference is the frequency of the residual solvent peak in the ^1H NMR spectrum.¹ ^1H and ^{19}F multiplicities are reported as follows: singlet (s), doublet (d), doublet of doublets (dd), quartet (q), multiplet (m), and broad resonance (br). Mass spectral data were obtained on a Micromass magnetic sector mass spectrometer or on a Micromass LCT mass spectrometer in electrospray ionization mode.

Materials and Methods

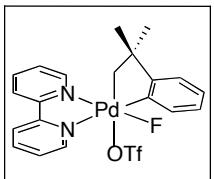

Bipyridine (bpy) and 2-methyl-2-phenylpropyl magnesium chloride were obtained from Aldrich. 1-Fluoro-2,4,6-trimethylpyridinium triflate (NFTPT) and 1-fluoro-2,4,6-trimethylpyridinium tetrafluoroborate (NFTPB) were obtained from TCI America. Unless otherwise noted, all reagents were used as received. NMR solvents were obtained from Cambridge Isotope Laboratories. All other solvents were obtained from Fisher Chemicals. Tetrahydrofuran was purified using an Innovative Technologies (IT) solvent purification system consisting of a copper catalyst, activated alumina, and molecular sieves.

X-ray Crystallography Details

Yellow cubes of **4** were grown by diffusion of pentane into a solution of **3** in wet acetone at -35 °C. A crystal of dimensions 0.10 x 0.10 x 0.10 mm was mounted on a Bruker SMART APEX CCD-based X-ray diffractometer equipped with a low temperature device and fine focus Mo-target X-ray tube ($\lambda = 0.71073 \text{ \AA}$) operated at 1500 W power (50 kV, 30 mA). The X-ray intensities were measured at 85(1) K; the detector was placed at a distance 5.055 cm from the crystal. A total of 4717 frames were collected with a scan width of 0.5° in ω and 0.45° in phi with an exposure time of 30 s/frame. The integration of the data yielded a total of 119486 reflections to a maximum 2 θ value of 56.64° of which 7429 were independent and 7186 were greater than 2 $\sigma(I)$. The final cell constants (Table 1) were based on the xyz centroids of 9866 reflections above 10 $\sigma(I)$. Analysis of the data showed negligible decay during data collection; the data were processed with SADABS and corrected for absorption. The structure was solved and refined with the Bruker SHELXTL (version 2008/4) software package, using the space group Pca2(1) with Z = 4 for the formula C₃₃H₂₆BN₃F₄Cl₂Pd. All non-hydrogen atoms were refined anisotropically with the hydrogen atoms placed in idealized positions. Full matrix least-squares refinement based on Φ^2 converged at R1 = 0.0219 and wR2 = 0.0533 [based on I > 2sigma(I)], R1 = 0.0232 and wR2 = 0.0542 for all data. Additional details are presented in **Table S2** and are available in the corresponding CIF file (deposited in the Cambridge Structural Database: CCDC 852596).

Computational Methods

Using the Gaussian 09 suite of programs,³ all density functional theory (DFT) calculations were performed with the M06 functional⁴ along with the Stevens (CEP-31G) valence basis sets with effective core potentials.^{5,6} The CEP-31G basis sets are triple- ξ for Pd and double- ξ for all main group elements. A d-polarization function (see 6-31G*)^{7,8} was added to all non-hydrogen main group elements: $\xi_d = 0.8$ for carbon, nitrogen, oxygen, and fluorine (referred to as CEP-31G(d) level of theory). All geometries were optimized using CEP-31G(d)/M06 without symmetry constraints using the restricted Kohn-Sham formalism for all complexes.. All minima were confirmed by the absence of imaginary frequencies and all transition states were verified by visual inspection of the single imaginary frequency vibration and optimized along the reaction coordinate. Thermochemical data was calculated using unscaled vibrational frequencies and default parameters at 298.15 K and 1 atm. Solvent corrections (CH_2Cl_2) were performed as single point calculations using the SMD model⁹ with default settings at the optimized geometries from gas phase calculations.

Energy Comparisons

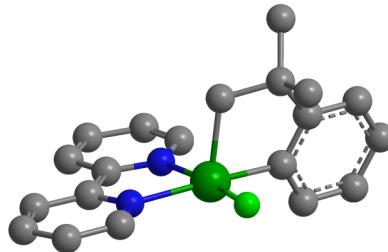

Calculated energies of the intermediates and transition states calculated are shown below. All energies have been solvent corrected using dichloromethane. All energies are listed in kcal/mol and complex **8** has been set to 0.0 for reference.
