Supporting Information Figure 1. Myelin-reactive CXCR3−/− Th1 cells readily infiltrate the CNS of adoptive transfer recipients. Draining LN cells from MOG35:55/ CFA immunized WT (left) or CXCR3−/− (right) mice were cultured with antigen under Th1-polarizing conditions prior to transfer into CD45.1 congenic hosts. Spinal cord mononuclear cells from each cohort (n= 5 mice/group) were pooled at the end of the experiment and analyzed by flow cytometry to quantify the absolute total number of CD45.2+ donor cells and CD45.1+ congenic host cells per spinal cord. The experiment was repeated twice with similar results.
