Highly polarized Th17 cells induce EAE via a T-bet independent mechanism

Supporting Information

Supporting Information Figure 1. MOG-primed, Th17-polarized CD4⁺ T cells were rested for 4 days and rechallenged with MOG₃₅₋₅₅-pulsed APCs as described in Fig. 2C. Supernatants collected 48 hours later were subjected to the Luminex protein assay. Data are shown as mean + SEM of 4 experiments.
