

Fig. 1S. Expression of Hac1^p in nitrogen-starved cells inhibits ascus formation. A WT strain transformed with either empty vector or pRS316-*HAC1ⁱ* was grown to mid-log phase on acetate, shifted to nitrogen-free medium, and total cells and multinucleated cells counted after 1 d. At least 200 cells were counted in each sample. The standard error for each sample was calculated from the square root of cells counted and by using Gauss' law for error propagation.
