The practice models and methods for effective social work interventions, promotion and prevention since the implementation of psychosocial interventions should take into consideration county specific risk considerations for the etiology of the chronic conditions in Hunedoara County were assessed.

The most important communities in this county were developed around enterprises focused on: metallicurgic and siderurgic industry, coal and gold mining, uranium extraction, as well as thermal-power and hydro-power plants.

The long-term exposure (active and reactive) to high amounts of toxic compounds, used in the metallicurgic and siderurgic industry, the exposure to toxic minerals from the extraction and refinement, were associated with comorbid conditions and a shortened life span.

The comorbid medical conditions of under served categories such as elder adults, residents from rural areas, and children/adolescents from schools, and family and social situations, reflect a large concern.

No formal role of social workers or other health professionals is assigned in the healthcare system in terms of psychosocial support provision for patients and their families.

Program implementation

Psychoeducational sessions, as well as therapy interventions and their benefits were presented to the multidisciplinary team of specialists involved in the implementation of the psychosocial intervention for patients with a comorbid condition in the healthcare system.

During the implementation sessions psychosocial interventions were presented as a vital component of the medical care. Appropriate training was ensured by presentations of the similar programs, existing concerns, and success stories.

A three-week pilot experiment was proposed in order to estimate costs, evaluate feasibility, establish the time frame and design, predict outcomes, performance, and sustainability. The standard intervention model was analyzed and adapted in collaboration with the interdisciplinary team.

Outcomes

In the course of my special study, I had the opportunity to engage with various health professionals and stakeholders in order to explore options for the implementation of the psychosocial intervention for patients with a comorbid condition in the health care system.

Addressing the comorbid medical condition of patients should be an ongoing effort and prerequisite at both national and local level, reducing the effect of state, nonprofit, and private sector.

The final report of the special study included: background information, a presentation of the Romanian health care system and its reforms, the available forms of psychosocial support, the necessity of implementation of psychosocial support and educational services for children, adolescents, and adults. The health care system is considered important for children, adults, and elderly people suffering from state institutions, challenges in the health care system, staff shortage, specific conditions of Hunedoara County, psychosocial interventions in the healthcare system, connections and recommendations. Implementation of expressive therapies in the health care system (intervention goals, intervention model, group), implementation considerations, and support groups were also included.

Skills Developed

The special study enhanced my abilities to effectively integrate advocacy, promote awareness, and select psychosocial interventions that would facilitate recovery and functionality in the health care system.

This global study enriched my experience and allows me to better understand, assess, and evaluate circumstances, medical conditions and concerns patients have, while promoting engagement, trust, empowerment, and treatment services in the health care system.

The global special study promoted cultural competency that will guide my practice and will help me be efficient when working with a large spectrum of population not only in terms of ethnicity, gender, and race, but also in terms of different worldviews, ability, identity, and life experiences.

Lessons Learned

• The implementation of psychosocial interventions should take into consideration county specific risk factors, resilience factors, prevalence, and symptomatology of patients with a comorbid condition.

• For this population, access requires an adequate effort, a multifaceted approach, and an active involvement of stakeholders in order to improve access to health care services.

• Similar healthcare programs should be studied and successful initiatives should be adapted to the potential and needs of the communities.

• Improving the existing prevention and treatment programs by creating an educational component in the healthcare system.

• Since no qualified health care professionals are assigned in providing psychosocial support in Romanian hospitals, in-service training for the existing personnel remains the only options for the Romanian health care system.

Classroom Connections

• The practice models and methods for effective social work interventions, promotion and prevention aspects in mental health, delivery models of psychosocial treatments and rehabilitation services presented in Social Work Practice in Mental Health (SW 606) provided valuable information when designing the psychosocial interventions. In addition, Mental Health Policy and Services (SW 626) through information related to public health concepts and policies, delivery systems, and service settings, guided me when establishing the framework for the special study.

• I was able to build my advocacy for implementing the psychosocial interventions based on research and knowledge gained in Mental Health and Mental Disorders of Adults and Elderly (SW 606) course, Interpersonal Practice with Adult Individuals (SW 7100), Interpersonal Practice with Groups (SW 5960), as well as the Information provided by Advanced Topics in Interpersonal Practice and Therapy (PSY 5970: Cognitive Behavioral Therapy, Family Psychoeducation, and Dyadic Behavioral Therapy).

• Advanced Topics Macro SW Issues in Global Social (SW 790) particularly equipped me with principles of global social work practice along with competencies and strategies for developing psychosocial interventions in the healthcare system.

Career Connections

After the completion of my special study, I am more aware about the role of increased collaboration between all the actors involved in the healthcare system and the fact that the implementation of a collaborative healthcare system addresses patients’ physical and psychological well-being in a holistic approach.

Significant gaps identified in the coordination of services for patients with a comorbid condition should be addressed immediately.

The special study provided the opportunity to address my passion for social change in a historically oppressed society with a strong interest in clinical social work.

Advice

I would highly suggest taking Advanced Topics Macro SW Issues in Global Social (SW 790) in the semester prior departmental special studies. I would suggest coordinating with other students who already had the opportunity for a special study abroad. Researching information about the country is extremely useful for a successful and safe international study.

Become knowledgeable about country’s history, develop an appreciation for people’s values, and be sensitive to their unique set of challenges and strengths. It is also useful to have an idea about country’s language, predominant religion, people’s preoccupations, and notable achievements.

Acknowledgments

I want to extend my thanks to UM School of Social Work, Office of Global Activities and the Alumni Board of Governors for financially supporting my special study.

I would like to address special thanks to my advisor, Dr. Bradley Zuckerman for his guidance and advice. I would like to thank Dr. Lawrence Root and Mrs. Katie Lopey, UM/UMW for Office of Global Activities for their consistent support and guidance.

I also want to extend my thanks to Dr. Lila Dobrin, Romania, EU for her collaboration. Finally, I would like to express my gratitude to my family for their understanding and support.

Location: Romania, Europe

Romania is a country located at the intersection of Central and Southeastern Europe. According to the Bureau of Statistics, the name of the country, Romania, reflects the influence of ancient Rome on the nation’s language and culture. The total population in Romania was last recorded at 21.33 million inhabitants.

The official language is Romanian. The vast majority of Romanian residents share a common culture. Christianity is the predominant religion.

Romania went through many trials during the decades of the communist regime. The fall of communism had a profound impact on Romanian culture, society, poverty, social problems, and stagnation, as well as political and economic instability.

The Healthcare System

Romania confronted major changes after the fall of the communist regime and struggle greatly to overcome barriers in the healthcare system, address specific areas of concern and the “chronic underfunding”, while avoiding “the collapse of the system” (2010).

The recent recession in the healthcare system imposed serious restrictions to the access of what supposed to be “free” public healthcare.

Global Field Agency

Hateg Hospital, Hunedoara County, RO

In order to determine an appropriate selection of psychosocial interventions for patients with chronic conditions, intervention model was selected with mental health system.

Psychoeducation, family for their understanding and support. Activities for their continued support and guidance. Psychoeducation.
