Colleges of Engineering and Architecture

Announcement

1930-1931
UNIVERSITY OF MICHIGAN

ALEXANDER GRANT RUTHVEN, Ph.D., President

College of Literature, Science, and the Arts, JOHN R. EFFINGER, Dean

(Admission officers: The Dean, for advanced standing; Registrar Ira M. Smith, for freshmen.)

General literary and scientific courses; special programs in ancient and modern languages, astronomy, mathematics, landscape design, library science, journalism, physics, chemistry, biology, geology, municipal administration, and social service; pre-professional programs; combined curricula with business administration, dentistry, forestry, law, medicine, and nursing.

Colleges of Engineering and Architecture, HERBERT C. SADLER, Dean

(Admission officers: Associate Dean George W. Patterson, for advanced standing in Engineering; Professor Emil Lorch, for advanced standing in Architecture; Registrar Ira M. Smith, for freshmen in Engineering and Architecture.)

Four-year and five-year curricula in civil, mechanical, electrical, chemical, marine, and aeronautical engineering, geodesy and surveying, mathematics, physics, astronomy, engineering mechanics, transportation, architecture, and architectural engineering, and two-year program for special students in architecture. Broad training in fundamentals. Opportunities for specialization in all departments. Practical instruction in laboratories, shops, and the field, under teachers of professional experience. Combined curricula of mechanical, chemical, and electrical engineering with business administration; Combined Curriculum in Engineering and Law; co-operative curricula in civil (highway) and electrical engineering.

Medical School, HUGH CABOT, Dean

(Admission officers: The Dean, for Medical School; Registrar Ira M. Smith, for Curricula in Nursing.)

Seventy hours of collegiate preparation required. Four-year graded professional curriculum. Modern laboratories. Ample clinical facilities in hospitals under University control. Three-year and five-year curricula in nursing.

Law School, HENRY M. BATES, Dean

(Admission officer: The Dean.)

Requirements for admission: (1) an A.B. degree (or its equivalent); or (2) the satisfactory completion of three years’ study, (a) on the Combined Curriculum in Letters and Law, in the College of Literature, Science, and the Arts; or (b) on the Combined Curriculum in Engineering and Law, in the College of Engineering. Three-year curriculum, with graduate year. Instruction in all branches of our system of law, and in international law, Roman law, and jurisprudence. Library of approximately 80,000 volumes.

College of Pharmacy, EDWARD H. KRAUS, Dean

(Admission officers: Professor Clifford C. Glover, for advanced standing; Registrar Ira M. Smith, for freshmen.)

Four-year curricula leading to the degree of Bachelor of Science in Pharmacy. Fully equipped laboratories. Pharmacy experience in Health Service and hospitals. Training for prescription service, manufacturing pharmacy, food and drug inspection, analysis, laboratory and clinical technology, pharmaceutical administration. Combined curriculum in pharmacy and medicine.

(Continued on inside page of back cover.)

The days that the University is in session are printed in light face type; Sundays, holidays, and vacations in dark face.
CALENDAR

1930

January 6  (Morning) Classes Resume after Holiday Vacation
February 1  Semester Examinations Begin
February 13-15 Examinations for Admission
February 14  (Evening) First Semester Closes
February 14 and 15 Classification for Second Semester
February 17 SECOND SEMESTER BEGINS
February 22 Holiday, Washington's Birthday
April 11  (Evening) Spring Vacation Begins
April 21 Classes Resume
May 30 Holiday, Memorial Day
June 7 Semester Examinations Begin
June 23 COMMENCEMENT
June 30—August 22 Summer Session
September 22-26 Examinations for Admission
September 23-27 Freshman Week
September 27 and 29 Classification of All Students
September 30 FIRST SEMESTER BEGINS
November 27 Thanksgiving Day
December 19  (Evening) Holiday Vacation Begins

1931

January 5  (Morning) Classes Resume
January 31 Semester Examinations Begin
February 12-14 Examinations for Admission
February 13  (Evening) First Semester Closes
February 13 and 14 Classification for Second Semester
February 16 SECOND SEMESTER BEGINS
February 23 Holiday, Washington’s Birthday
April 10 (Evening) Spring Vacation Begins
April 20 Classes Resume
May 30 Holiday, Memorial Day
June 6 Semester Examinations Begin
June 22 COMMENCEMENT
June 29—August 21 Summer Session
September 21-25 Examinations for Admission
September 22-26 Freshman Week
September 26 and 28 Classification of All Students
September 29 FIRST SEMESTER BEGINS
Part I

OFFICERS AND FACULTY, 1929-1930

BOARD OF REGENTS

Elected Members

Hon. JUNIUS E. BEAL, Ann Arbor..................Dec. 31, 1931
Hon. RALPH STONE, Detroit......................Dec. 31, 1931
Hon. WILLIAM L. CLEMENTS, Bay City..........Dec. 31, 1933
Hon. JAMES O. MURFIN, Detroit...............Dec. 31, 1933
Hon. ESTHER M. CRAM, Flint..................Dec. 31, 1935
Hon. LUCIUS L. HUBBARD, Houghton..............Dec. 31, 1935
Hon. WALTER H. SAWYER, Hillsdale.............Dec. 31, 1937
Hon. R. PERRY SHORTS, Saginaw...............Dec. 31, 1937

Members ex Officio (without Vote)

Hon. WEBSTER H. PEARCE, Lansing, State Superintendent of Public Instruction
ALEXANDER GRANT RUTHVEN, President of the University

OFFICERS

ALEXANDER GRANT RUTHVEN, President
SHIRLEY W. SMITH, Secretary
ROBERT A. CAMPBELL, Treasurer

ADMINISTRATIVE OFFICERS

HERBERT CHARLES SADLER, Sc.D., L.L.D., Dean 1510 Hill Street
GEORGE WASHINGTON PATTERSON, S.B., Ph.D., Associate Dean,
College of Engineering 2101 Hill Street
EMIL LORCH, A.M., In Charge of the College of Architecture
718 Church Street
LOUIS ALLEN HOPKINS, Ph.D., Secretary
CAMILLA BLANCHE GREEN, Assistant Secretary 1517 South University Avenue
IRA MELVILLE SMITH, L.L.B., Registrar 910 Dewey Avenue
ALBERT EASTON WHITE, Sc.D., Director, Department of Engineering Research 4 Geddes Heights
1417 South University Avenue
PROFESSORS EMERITUS

Harry Burns Hutchins, LL.D., President Emeritus
508 Monroe Street

1405 Hill Street

William Henry Butts, Ph.D., Professor Emeritus of Mathematics
1122 Hill Street

William Henry Wait, Ph.D., Professor Emeritus of Modern Languages
332 East William Street

Fred Newton Scott, Ph.D., Professor Emeritus of Rhetoric and Journalism

MEMBERS OF THE FACULTY AND OTHER OFFICERS*

Professors

Ernest James Abbott, M.S., Associate Investigator in Engineering Research
217 North Division Street

Edward Larrabee Adams, Ph.D., Professor of Romance Languages
1850 Washtenaw Avenue

Henry Clay Anderson, B.M.E., Professor of Mechanical Engineering
1610 Washtenaw Avenue

†Walter Lucius Badger, M.S., Professor of Chemical Engineering
917 Church Street

Benjamin Franklin Bailey, Ph.D., Professor of Electrical Engineering
1019 Baldwin Avenue

Edwin Myron Baker, B.S., Associate Professor of Chemical Engineering
1603 Morton Avenue

Ernest Franklin Barker, Ph.D., Associate Professor of Physics
18 Ridge Way

Floyd Earl Bartell, Ph.D., Professor of General and Physical Chemistry
1919 Scottwood Avenue

Wells Ira Bennett, M.S., Associate Professor of Architecture
500 Highland Road

‡Samuel Lawrence Bigelow, Ph.D., Professor of General and Physical Chemistry
1520 Hill Street

William Warner Bishop, A.M., Litt.D., LL.D., Librarian
733 Oakland Avenue

Orlan William Boston, M.S.E., M.E., Director of Engineering Shops, and Professor of Shop Practice
2021 Vinewood Boulevard

Harry Bouchard, B.C.E., Associate Professor of Geodesy and Surveying
1111 Woodlawn Avenue

*In this list are included the names of certain instructors in other colleges offering courses of interest to students in engineering and architecture.
†On leave of absence, first semester, 1929-1930.
‡On leave of absence, 1929-1930.
MEMBERS OF THE FACULTY

JOHN WILLIAM BRADSHAW, Ph.D., Professor of Mathematics
1304 Cambridge Road

EDWARD MILTON BRAGG, B.S., Professor of Marine Engineering and Naval Architecture
1056 Ferdon Road

JOHN CROWE BRIER, M.S., Professor of Chemical Engineering
2301 Vinewood Boulevard

HUGH BRODIE, C.E., Associate Professor of Geodesy and Surveying
611 Forest Avenue

GEORGE GRANGER BROWN, Ph.D., Ch.E., Associate Professor of Chemical Engineering
2037 Geddes Avenue

JOSEPH ALDRICH BURSLEY, B.S. (M.E.), Professor of Mechanical Engineering, and Dean of Students
2107 Hill Street

*HARRY LINN CAMPBELL, M.S., Associate Professor of Shop Practice
935 Dewey Avenue

JOSEPH HENDERSON CANNON, B.S. (E.E.), Professor of Electrical Engineering
1015 Church Street

CLIFTON O’NEAL CAREY, C.E., Associate Professor of Geodesy and Surveying
Geddes Road

ERMINE COWLES CASE, Ph.D., Professor of Historical Geology and Paleontology, and Director of the Museum of Paleontology
619 East University Avenue

JOHN CHIPMAN, Ph.D., Associate Investigator in Engineering Research
1508 Geddes Avenue

JAMES HARLAN CISSEL, B.S.(C.E.), Professor of Structural Engineering
2022 Hill Street

WALTER FRANCIS COLBY, Ph.D., Professor of Physics
1020 Hill Street

†RALPH HAMILTON CURTISS, Ph.D., Professor of Astronomy and Director of the Observatory
1308 East Ann Street

ARTHUR JAMES DECKER, B.S.(C.E.), Professor of Sanitary Engineering
2014 Geddes Avenue

BRUCE MCNAUGHTON DONALDSON, A.M., Associate Professor of Fine Arts
716 Forest Avenue

BASIL D. EDWARDS, LL.B., Major, U.S.A., Professor of Military Science and Tactics
1412 Cambridge Road

WALTER JOHNSON EMMONS, B.S., A.M., Associate Professor of Highway Engineering, and Director of the Highway Laboratory
1128 Michigan Avenue

JOHN EDWARD EMSWILER, M.E., Professor of Mechanical Engineering
1303 Granger Avenue

CHARLES HORACE FESSSENDEN, M.E., Professor of Mechanical Engineering
1004 East University Avenue

PETER FIELD, Ph.D., Professor of Mathematics
904 Olivia Avenue

*On leave of absence, first semester, 1929-1930.
†Died December 25, 1929.
FRANK RICHARD FINCH, Ph.B., Associate Professor of Mechanism and Engineering Drawing  
1619 South University Avenue

JAMES WATERMAN GLOVER, Ph.D., Professor of Mathematics and Insurance  
620 Oxford Road

MOSES GOMBERG, Sc.D., Professor of Organic Chemistry  
712 Onondaga Street

SAMUEL ABRAHAM GOUDSMIT, Ph.D., Associate Professor of Physics  
508 Thompson Street

HERBERT JAY GOULDING, B.S., Associate Professor of Mechanism and Engineering Drawing  
703 Berkshire Road

LEWIS MERRITT GRAM, B.S.(C.E.), Professor of Civil Engineering  
1904 Austin Avenue

CLARE ELMER GRIFFIN, Ph.D., Professor of Marketing, and Dean of the School of Business Administration  
21 Ridge Way

RANSOM SMITH HAWLEY, M.E., Professor of Mechanical Engineering  
Ann Arbor Hills

WILLIAM D. HENDERSON, Ph.D., Director of the Division of University Extension  
Cutting Apartments

HENRY HAROLD HIGBIE, E.E., Professor of Electrical Engineering  
402 Awixa Road

THEOPHIL HENRY HILDEBRANDT, Ph.D., Professor of Mathematics  
1930 Cambridge Road

*WILLIAM CHRISTIAN HOAD, B.S.(C.E.), Professor of Sanitary and Municipal Engineering  
2108 Melrose Avenue

WILLIAM HERBERT HOBBS, Ph.D., Professor of Geology, and Director of the Geological Laboratory and Geological Museum  
1705 Hill Street

LOUIS ALLEN HOPKINS, Ph.D., Associate Professor of Mathematics, and Secretary of the Colleges of Engineering and Architecture  
1517 South University Avenue

WALTER FRED HUNT, Ph.D., Professor of Petrology  
1030 Baldwin Avenue

FRANK WEBBER HUTCHINGS, LL.B., Special Representative, Engineering Research  
1430 Boston Blvd., Detroit

CLARENCE THOMAS JOHNSTON, C.E., Professor of Geodesy and Surveying, and Director of the Davis Engineering Camp  
1335 Hill Street

WALTER EDWIN JOMINY, B.Ch.E., M.S., Investigator in Engineering Research  
1433 White Street

HUGH EDWARD KEELER, M.S.E., Associate Professor of Mechanical Engineering  
1202 Olivia Avenue

HERBERT ALDEN KENYON, A.M., Associate Professor of French and Spanish  
1103 Ferdon Road

*On leave of absence, first semester, 1929-1930.
MEMBERS OF THE FACULTY

Horace Williams King, B.S.(C.E.), Professor of Hydraulic Engineering
Hilldene Manor
Edward Henry Kraus, Ph.D., Sc.D., Professor of Crystallography and Mineralogy, and Director of the Mineralogical Laboratory, Dean of the College of Pharmacy, and, Dean of the Summer Session
Arlington Boulevard
Walter Edwin Lay, B.M.E., Associate Professor of Mechanical Engineering
101 Orchard Hill Drive
Alfred Oughton Lee, M.D., Professor of Modern Languages
814 Hill Street
David Martin Lichty, Ph.D., Associate Professor of General and Physical Chemistry
922 Olivia Avenue
Anders Fredrik Lindblad, Sc.D., Associate Professor of Naval Architecture
1408 Wells Street
George Allan Lindsay, Ph.D., Associate Professor of Physics
2015 Day Street
Emil Lorch, A.M., Professor of Architecture, in Charge of the College of Architecture
718 Church Street
*Clyde Elton Love, Ph.D., Professor of Mathematics
1915 Scottwood Avenue
Alfred Henry Lovell, M.S.E., Professor of Electrical Engineering
3000 Geddes Road
George McDonald McConkey, B.A.E., Professor of Architecture
R.R. 2, Washtenaw Road
Ferdinand Northrup Menefee, C.E., Professor of Engineering Mechanics
6 Geddes Heights
Henry Willard Miller, M.E., Professor of Mechanism and Engineering Drawing
1809 Hill Street
Arthur Deearth Moore, M.S., Associate Professor of Electrical Engineering
718 Onondaga Street
Roger LeRoy Morrison, A.M., C.E., Professor of Highway Engineering and Highway Transport
1928 Lorraine Place
Joseph Raleigh Nelson, A.M., Professor of English, and Editor of Publications in Engineering Research
2145 Melrose Avenue
John Minert Nickelsen, B.S.(M.E.), Associate Professor of Mechanical Engineering
511 Linden Street
Julius Clark Palmer, B.S., Associate Professor of Mechanism and Engineering Drawing
14 Ridge Way
George Washington Patterson, Ph.D., Professor of Engineering Mechanics, and Associate Dean of the College of Engineering
2101 Hill Street
Felix Wladyslaw Pawlowski, M.S., M.andE.E., Guggenheim Professor of Aeronautical Engineering
925 Greenwood Avenue

*On leave of absence, second semester, 1929-1930.
ELMORE SHAW PETTYJOHN, A.B., M.S.E., Investigator in Engineering Research, and Assistant Professor of Gas Engineering
220 South Thayer Street

VINCENT COLLINS POOR, Ph.D., Associate Professor of Mathematics
930 Packard Street

HARRISON McALLISTER RANDALL, Ph.D., Professor of Physics, and Director of the Physics Laboratory
1208 Prospect Street

DANIEL LESLIE RICH, Ph.D., Associate Professor of Physics
720 E. University Avenue

*HENRY EARL RIGGS, A.B., C.E., Professor of Civil Engineering, and Honorary Curator of the Transportation Library
Underdown Road, Barton Hills

RICHARD ALFRED ROSSITER, Ph.D., Associate Professor of Astronomy, and Chief Astronomer of the Lamont-Hussey Observatory of the University of Michigan
13 Innes Avenue, Bloemfontein, Orange Free State, South Africa

ALBERT JOSEPH ROUSSEAU, Professor of Architecture
2001 Vinewood Avenue

THEODORE RUDOLPH RUNNING, Ph.D., Professor of Mathematics
1019 Michigan Avenue

HERBERT CHARLES SADLER, Sc.D., LL.D., Professor of Naval Architecture and Marine Engineering, and Dean of the Colleges of Engineering and Architecture
1510 Hill Street

WALTER CLIFFORD SADLER, M.S., C.E., Associate Professor of Civil Engineering
1420 White Street

RALPH ALANSON SAWYER, Ph.D., Associate Professor of Physics
1132 Michigan Avenue

†FRANCIS LEE SCHNEIDER, A.M., Associate Professor of English

RICHARD SCHNEIDEWIND, B.S.(Ch.E.), M.S.E., Associate Investigator in Engineering Research
R.R. 3, Box 27

CHESTER SEITZ SCHOEFFLE, Sc.D., Associate Professor of Organic Chemistry
1102 Forest Avenue

IRVING DAY SCOTT, Ph.D., Associate Professor of Physiological Geology
1043 Olivia Avenue

WILLIAM HAMILTON SELLW, S.B., Assistant Director of Engineering Research
2122 Hill Street

‡ISAIAH LEO SHARFMAN, A.B., LL.B., Professor of Economics

ROBERT HENRY SHERLOCK, B.S.(C.E.), Associate Professor of Civil Engineering
1219 Packard Street

ALLEN FIRMAN SHERZER, B.M.E., Associate Professor of Mechanical Engineering
1213 Ferdon Road

*On leave of absence, 1929-1930.
†Died March 7, 1929.
‡On leave of absence, 1929-1930.
MEMBERS OF THE FACULTY

WILLIAM GABB SMEATON, A.B., Professor of General and Physical Chemistry 1941 Geddes Avenue

ARTHUR WHITMORE SMITH, Ph.D., Professor of Physics 1008 Oakland Avenue

EDWARD A. STALKER, M.S.E., Professor of Aeronautical Engineering 619 East University Avenue

FRANK HOWARD STEVENS, B.S., Associate Professor of Engineering Mechanics 1125 Lincoln Avenue

AUBREY TEALDI, Graduate Royal Technical Institute, Livorno, Professor of Landscape Design, and Director of the Nichols Arboretum 1837 Vinewood Avenue

STEPHEN TIMOSHERNO, Adjunct of Applied Mechanics, Professor of Engineering Mechanics 2007 Washtenaw Avenue

WILLIAM CLEVELAND TITCOMB, A.B., B.S.A., Professor of Architecture 520 East Jefferson Street

*GEORGE EUGENE UHLENBECK, Ph.D., Associate Professor of Physics 202 Forest Plaza Apartments

RALPH HAZLETT UPSON, M.E., Lecturer in Aeronautical Engineering General Motors Building, Detroit

CLAIR UPTHEGROVE, B.Ch.E., Associate Professor of Metallurgical Engineering 1417 Granger Avenue

JOHN A. VAN DEN BROEK, Ph.D., Professor of Engineering Mechanics 1331 Sheehan Avenue

HAROLD BURTON VINCENT, M.S., Ph.D., Associate Investigator in Engineering Research 1417 South University Avenue

†ROBERT MARK WENLEY, D.Phil., Sc.D., Litt.D., LL.D., D.C.L., Professor of Philosophy 608 Onondaga Street

ALBERT EASTON WHITE, Sc.D., Professor of Metallurgical Engineering, and Director of the Department of Engineering Research 1417 South University Avenue

ALFRED HOLMES WHITE, A.B., B.S., Professor of Chemical Engineering 608 Onondaga Street

ERNEST WILBY, Professor of Architecture 13 Cutting Apartments

EDMUND WILD, M.S., Associate Professor of German 532 Walnut Street

HOBART HURD WILLARD, Ph.D., Professor of Analytical Chemistry 332 East William Street

NEIL HOOKER WILLIAMS, Ph.D., Professor of Physics 1020 Olivia Avenue

CLYDE ELMORE WILSON, M.S.E., Professor of Mechanical Engineering 522 Linden Street

CHESTER OWEN WISLER, B.C.E., M.S.E., Associate Professor of Hydraulic Engineering 810 Arch Street

*On leave of absence, first semester, 1929-1930.

†Died March 29, 1929.
WILLIAM PLATT WOOD, A.B., M.S.E., Associate Professor of Metallurgical Engineering
Ann Arbor Hills

JOHN STEPHEN WORLEY, C.E., Professor of Transportation Engineering, and Curator of the Transportation Library
Michigan Union

Assistant Professors

HENRY CARTER ADAMS, 2nd, A.B., M.S., Assistant Professor of Naval Architecture and Marine Engineering
1421 Hill Street

JOSÉ M. ALBALADEJO, Bachelor, Institute Cardinal, Assistant Professor of Spanish
1500 Westminster Place

GLENN LESLIE ALT, B.S.(C.E.), Assistant Professor of Civil Engineering
918 Sybil Street

LEIGH CHARLES ANDERSON, Ph.D., Assistant Professor of Organic Chemistry
1327 Forest Court

STEPHEN STANLEY ATTWOOD, M.S., Assistant Professor of Electrical Engineering
1411 Wells Street

WILLIAM L. AYRES, Ph.D., Assistant Professor of Mathematics
936 Dewey Avenue

WERNER EMANUEL BACHMANN, Ph.D., Assistant Professor of Organic Chemistry
407 Observatory Lodge

ERNEST HARRISON BARNES, A.M., Assistant Professor of Drawing and Painting
815 Church Street

ROBERT D. BRACKETT, A.M., Assistant Professor of English
1301 Hormann Court

CHARLES J. BRASEFIELD, B.S., Ph.D., Assistant Investigator in Engineering Research
400 Maple Ridge

HAROLD HUDSON BRITTON, A.M., Assistant Professor of Romance Languages
1316 North University Avenue

FRANK N. M. BROWN, B.S.E., Assistant Professor of Aeronautical Engineering
208 North Division Street

PAUL NARCISS BUKOVSKY, M.S., Assistant Professor of Mechanism and Engineering Drawing
423 Benjamin Street

HEMPSTEAD STRATTON BULL, M.S., Assistant Professor of Electrical Engineering
Ann Arbor Hills

CARL EDWIN BURKLUND, A.M., Ph.D., Assistant Professor of English
Marlboro Drive

FLOYD NEWTON CALHOON, M.S., Assistant Professor of Mechanical Engineering
1047 Olivia Avenue

ROBERT JOHN CARNEY, Ph.D., Assistant Professor of Analytical Chemistry, and Director of Chemistry Store
519 Lawrence Street

MYRON BUTMAN CHAPIN, Ph.B., Assistant Professor of Drawing and Painting
1027 Forest Avenue

ALBERT LORING CLARK, Jr., B.S.E., Assistant Professor of Mechanism and Engineering Drawing
14 Ridge Way
CLAUDE LESTER CLARKE, M.S.E., Ph.D., Assistant Investigator in Engineering Research, 909 Willow Street
ROBERT CARL COLE, A.M., Assistant Professor of Mechanism and Engineering Drawing, 507 Walnut Street
JAMES MURLE CORK, Ph.D., Assistant Professor of Physics, 2034 Day Street

ARTHUR B. CUSTIS, Captain, U.S.A., Assistant Professor of Military Science and Tactics, 1023 Oakland Avenue
CARL LEONARD DAHLSTROM, A.M., Ph.D., Assistant Professor of English, 820 McKinley Avenue

DAVID MATHIAS DENNISON, Ph.D., Assistant Professor of Physics, 704 Pauline Boulevard
WILLIAM WELLS DENTON, Ph.D., Assistant Professor of Mathematics, 1014 Cornwell Place

RUSSELL ALGER DODGE, M.S.E., Assistant Professor of Engineering Mechanics, 1233 Baldwin Avenue
LLOYD HAMILTON DONNEELL, B.M.E., Assistant Professor of Engineering Mechanics, 712 Arch Street

WILLIAM GOULD DOW, M.S.E., Assistant Professor of Electrical Engineering, 912 Dewey Avenue

*ORA STANLEY DUFFENDACK, Ph.D., Assistant Professor of Physics, 2107 Devonshire Road
WILLIAM HENRY EGLY, A.M., Assistant Professor of English, 1208 Cambridge Court

MAURICE BARKLEY EICHELBERGER, B.S., Assistant Professor of Mechanism and Engineering Drawing, 906 Rose Avenue

ALFRED LYNN FERGUSON, B.Pd., Ph.D., Assistant Professor of General and Physical Chemistry, 721 Church Street

FLOYD ALBURN FIRESTONE, B.S., Assistant Professor of Physics, 1666 Broadway

HERBERT AthERTON FOWLER, Assistant Professor of Architectural Design, 520 East Jefferson Street

ROSWELL EARL FRANKLIN, B.S.E., Assistant Professor of Engineering Mechanics, 1328 Pontiac Street

WOLDEMAR O. FREYBERG, C.E., Assistant Investigator in Engineering Research, 1412 Geddes Avenue

ALOYSIUS JOSEPH GAiss, A.M., Assistant Professor of German, 322 East Ann Street

PAUL H. GEIGER, B.S., A.M., Ph.D., Assistant Investigator in Engineering Research, 901 Granger Avenue

CHARLES WINFRED GOOD, B.S.E., Assistant Professor of Mechanical Engineering, and Assistant to the Director of Engineering Research, 622 South Seventh Street

CHARLES BURTON GORDY, A.M., Assistant Professor of Mechanical Engineering and Assistant Professor of Production Management, 1929 Lorraine Place

*On leave of absence, 1929-1930.
ALEXANDER PETER GWIAZDOWSKI, M.E., Assistant Professor of Shop Practice 1503 Shadford Road

HOLGER MADS HANSEN, B.C.E., Assistant Professor of Mechanism and Engineering Drawing 1210 Wells Street

ALVIN JOHN HERZIG, B.S.E., Assistant Investigator in Engineering Research 210 Washtenaw Apartments

JAMES HALLETT HODGES, Ph.D., Assistant Professor of General and Physical Chemistry 722 Whaley Court

*OLIVER NELSON HOLLIS, A.B., Assistant Professor of Mechanical Engineering 1411 East Jefferson Avenue, Detroit

WILLIAM STUART HOUSEL, B.S.E., Assistant Professor of Civil Engineering 1119 Spring Street

RUSSELL C. HUSSEY, Ph.D., Assistant Professor of Geology 414 Camden Court

WALTER S. HUXFORD, A.B., M.S., Ph.D., Assistant Investigator in Engineering Research 1210 Henry Street

ANTHONY JOSEPH JOBIN, A.M., Assistant Professor of Romance Languages 1110 White Street

CLARENCE FRANK KESSLER, M.S.E., Assistant Professor of Mechanical Engineering 1756 Broadway

RICHARD THOMAS LIDDICOAT, B.S.E., Assistant Professor of Engineering Mechanics 1602 Morton Avenue

HAROLD RHY'S LLOYD, M.A., Assistant Professor of Mechanical Engineering 1321 Forest Court

ROBERT HUGHES LORD, B.S., Assistant Professor of Military Science and Tactics 1817 Jackson Avenue

ROY KENNETH McALPINE, Ph.D., Assistant Professor of Analytical Chemistry 926 Sylvan Street

WARREN LEE McCABE, M.S.E., Ph.D., Assistant Professor of Chemical Engineering 310 Maple Ridge

HAROLD JAMES McFARLAN, B.S.E., Assistant Professor of Geodesy and Surveying Long Shore Drive

DEAN BENJAMIN MCLaughlin, Ph.D., Assistant Professor of Astronomy 504 Walnut Street

AXEL MARIN, B.S.E., Assistant Professor of Mechanical Engineering Whitmore Lake Road

WALTER VANCLEVE MARSHALL, B.A.E., Assistant Professor of Architecture 1209 Henry Street

ALLAN DOUGLAS MAXWELL, Ph.D., Assistant Professor of Astronomy 1345 Geddes Avenue

CLIFFORD CYRILLE MELOCHE, Ph.D., Assistant Professor of Analytical Chemistry 525 Linden Street

CHARLES FERDINAND MEYER, Ph.D., Assistant Professor of Physics 1137 Fair Oaks Parkway

*On leave of absence, 1929-1930.
MEMBERS OF THE FACULTY

FRANK ALEXANDER MICKLE, M.E., Assistant Professor of Mechanical Engineering
1053 Olivia Avenue

THOMAS JOSEPH MITCHELL, B.C.E., Assistant Professor of Geodesy and Surveying
1129 Granger Avenue

GEORGE H. MONTILLON, Ph.D., Assistant Investigator in Engineering Research
715 Forest Avenue

GEORGE ALEXANDER MORLEY, B.S.(M.E.), Assistant Professor of Mechanism and Engineering Drawing
1321 Forest Court

FREDERIC CHARLES O'DELL, B.S.A., Assistant Professor of Architectural Drawing
1103 Berkshire Road

CHARLES THOMAS OLMSTED, B.S.(C.E.), Assistant Professor of Engineering Mechanics
2132 Brockman Boulevard

EVERETT PERCY PARTRIDGE, B.S. in Ch.E., M.S.E., Ph.D., Assistant Investigator in Engineering Research
1440 East Park Place

LAWRENCE AUGUST PHILIPP, Ph.D., Assistant Investigator in Engineering Research
14250 Plymouth Road, Detroit

PHILIP ORLAND POTTS, B.M.E., Assistant Professor of Mechanism and Engineering Drawing
824 Granger Avenue

CARROLL A. POWELL, E.E., M.S., Captain U.S.A., Assistant Professor of Military Science and Tactics
1327 Brooklyn Avenue

LEWIS STEPHEN RAMSDELL, Ph.D., Assistant Professor of Mineralogy
Packard Road

REGINALD LYONS RICKETT, B.S.E., Assistant Investigator in Engineering Research
432 Hamilton Place

LOUIS JOSEPH ROUSE, Ph.D., Assistant Professor of Mathematics
1137 Michigan Avenue

WILL CARL RUFUS, Ph.D., Assistant Professor of Astronomy
216 Pine Ridge

RAYMOND B. SAWYER, Ph.B., M.S., Assistant Investigator in Engineering Research
1406 Henry Street

*WILLIAM WARNER SLEATOR, Ph.D., Assistant Professor of Physics, and Assistant Investigator in Engineering Research
2503 Geddes Avenue

JEAN PAUL SLUSSER, A.M., Assistant Professor of Drawing and Painting
1324 Pontiac Street

MELVILLE BIGHAM STOUT, M.S., Assistant Professor of Electrical Engineering
1417 Morton Avenue

JOHN DONOVAN STRONG, A.B., M.S., Assistant Investigator in Engineering Research
421 South Division Street

ROY STANLEY SWINTON, M.S.E., Assistant Professor of Engineering Mechanics
1114 Woodlawn Avenue

*On leave of absence, 1929-1930.
LARS THOMASSEN, Chem. Eng., Ph.D., Assistant Professor of Chemical Engineering and Assistant Investigator in Engineering Research 1512 Granger Avenue

JESSE EARL THORNTON, A.M., Assistant Professor of English 1547 Granger Avenue

LEON THURM, Ph.D., Assistant Investigator in Engineering Research 1132 White Street

HIRAM BARRICKLOW TURNER, A.B., Captain U.S.A., Assistant Professor of Military Science and Tactics 1214 Willard Street

IVAN HENRY WALTON, A.M., Assistant Professor of English, and Assistant to Editor of Publications, Department of Engineering Research 59 Rosewood Street

HARRY JAMES WATSON, B.M.E., Assistant Professor of Mechanical Engineering 1510 Morton Avenue

PHILIP FRANCIS WEATHERILL, Ph.D., Assistant Professor of General and Physical Chemistry 1123 Church Street

CHRISTIAN NATHANIEL WENGER, Ph.D., Assistant Professor of English 420 South Fourth Avenue

HARLOW OLIN WHITTEMORE, B.S., M.L.D., Assistant Professor of Landscape Design 1920 Norway Road

GERALD D. WILSON, B.S., Assistant Investigator in Engineering Research 720 Arch Street

RALPH A. WOLFE, Ph.D., Assistant Investigator in Engineering Research 66 Harpst Street

EDWARD YOUNG, B.S.E., Assistant Professor of Geodesy and Surveying 1600 Montclair Place

HARRY EDWIN ZUCK, B.S.E., Assistant Investigator in Engineering Research 1436 East Park Place

Instructors

FREDERIC HOWARD ALDRICH, JR., Instructor in Freehand Drawing and Painting 1412 Pontiac Street

CHARLES RONELLO BARNUM, B.S.A., Instructor in Architecture 1110 Judson Court

RALPH LEROY BELKNAP, A.M., Sc.D., Instructor in Geology 414 Camden Court

ROSS THOMAS BITTINGER, B.S.A., Instructor in Decorative Design 14 Jefferson Apartments

GEORGE MOYER BLEEKMAN, M.S.E., Instructor in Geodesy and Surveying 1507 Morton Avenue

HENRY BLITON, Instructor in Shop Practice 523 East Washington Street

EDWIN A. BOYD, Instructor in Highway Engineering 832 Brookwood Place

WALTER F. BURKE, B.S., Instructor in Aeronautical Engineering 506 East Jefferson Street
MEMBERS OF THE FACULTY

LEE O. CASE, Ph.D., Instructor in General and Physical Chemistry  720 Whaley Court
RUEL VANCE CHURCHILL, M.S., Ph.D., Instructor in Mathematics  28 Rosewood Street
WENDELL MORRIS COATES, M.S., Sc.D., Instructor in Mathematics  745 East University Avenue
HARRY NEWTON COLE, M.S., Instructor in Analytical Chemistry  702 Forest Avenue
JOHN JOHNSON CORLISS, A.M., Instructor in Mathematics  1014 Cornwell Place
MARIA LOUISA CRANE, Instructor in Freehand Drawing  923 Olivia Avenue
JOHN SCOTT DONAL, JR., M.S., Instructor in Physics  513 South Division Street
BEN DUSHNIK, A.M., Instructor in Mathematics  1930 Cambridge Road
FRANKLIN LELAND EVERETT, M.S.E., Research Assistant in Engineering Research  610 South Division Street
SHIRLEY ERNEST FIELD, A.M., Instructor in Mathematics  Edgewood Hills
RUSSELL ARDEN FISHER, A.M., Instructor in Physics  907 East Huron Street
NEVIN COTTON FISK, M.S., Instructor in Mathematics  1505 Morton Avenue
*HARRY ROBINSON GAMBLE, B.S., M. in Arch., Instructor in Architecture  732 South Division Street
JAMES SHERMAN GAULT, M.S., Instructor in Electrical Engineering  1508 Westminster Place
WALTER J. GORES, A.M., Instructor in Architecture  Washtenaw Apartments
JOHN GRENNAN, Instructor in Shop Practice  719 South Seventh Street
DONAL HAMILTON HAINES, A.B., Instructor in Journalism, and Director of Publicity in Engineering Research  1229 Traver Road
JOSEPH OLNEY HALFORD, Ph.D., Instructor in Organic Chemistry  1015 Church Street
GORDON WILLIAM HARRISON, Ph.B., A.M., Instructor in Romance Languages  806 Sybil Street
LEWIS B. HEADRICK, M.S., Research Assistant in Engineering Research  1212 East University Avenue
JOHN HESSEL, B.S.E., Research Assistant in Engineering Research  1111 Forest Avenue
LEWIS NELSON HOLLAND, B.S.E., M.S., Instructor in Electrical Engineering  1205 Brooklyn Avenue

*On leave of absence, 1929-1930.
AUSTIN ALONZO HOWE, Instructor in Architecture
503 Capitol Theatre, Detroit

PAUL OSWALD HUSS, B.S. in Ed., B.S.E., Research Assistant in Engineering Research
R.R. 4

ARNE ARTHUR JAKKULA, M.S.(C.E.), Instructor in Civil Engineering
1215 Packard Street

GORDON L. JENSEN, B.S.E., Instructor in Mechanical Engineering
1356 Geddes Avenue

RALPH REDINGTON JOHNSON, A.M., Instructor in English
1514 Brooklyn Avenue

DONAT KONSTANTIN KAZARINOFF, Diploma from the University of Moscow, Instructor in Mathematics
1515 Cambridge Road

BEN KIEVIT, M.S., Instructor in Physics
1212 East University Avenue

LEO KIRSCHBAUM, A.M., Instructor in English
1918 Day Street

THOMAS JOHN KNEEBONE, Instructor in Shop Practice
816 Brookwood Place

HAZEL MARIE LOSH, Ph.D., Instructor and Research Assistant in Astronomy
910 East Huron Street

DONALD WILLIAM McCREADY, B.S.(Ch.E.), Instructor in Chemical Engineering
809 Kingsley Street

THOMAS ALOYSIUS McGUIRE, A.M., Instructor in Romance Languages
906 East Huron Street

*GUSTAVO MALDONADO, B.S.E., Instructor in Geodesy and Surveying

LEWIS K. MARSHALL, Lieut. (j.g.), U.S.N.R., Instructor in Naval Aviation
Pontiac, Michigan

PAUL E. MARTIN, M.S., Research Assistant in Engineering Research
606 Packard Street

RAYMOND MATHEWS, B.S.A., Instructor in Architecture
1508 Brooklyn Avenue

LAWRENCE CARNAHAN MAUGH, M.S., Instructor in Civil Engineering
1103 Church Street

CHARLES EMOY NELSON, B.S.E., Research Assistant in Engineering Research
1208 Granger Avenue

FRANCIS SKILLMAN ONDERDONK, Dr. of Technical Sciences, Instructor in Architecture
1331 Geddes Avenue

JAMES S. OWENS, B.S., Research Assistant in Engineering Research
1212 East University Avenue

ARTHUR F. PARKER, Instructor in Shop Practice
1441 White Street

GEORGE HOLMES PERKINS, A.B., M.Arch., Instructor in Architecture
1109 White Street

*On leave of absence, 1929-1930.
MEMBERS OF THE FACULTY

Theodore Ernest Rafford, A.M., Instructor in Mathematics
1618 Shadford Road

Charles William Selheimer, M.S., Instructor in Chemical Engineering
1308 East Ann Street

Chester Baker Slawson, Ph.D., Instructor in Mineralogy
220 South Thayer Street

Victor Vaughan Slocum, Instructor in Sculpture
3310 Kimberly Road

Byron Avery Soule, Sc.D., Instructor in Analytical Chemistry
1414 West Huron Street

Charles William Selheimer, M.S., Instructor in Chemical Engineering
1308 East Ann Street

Chester Baker Slawson, Ph.D., Instructor in Mineralogy
220 South Thayer Street

Victor Vaughan Slocum, Instructor in Sculpture
3310 Kimberly Road

William Telfer, Instructor in Shop Practice
R.R. 8, Washtenaw Road

Willard Irving Truettner, B.S.E., Research Assistant in Engineering Research
224 South Thayer Street

Alexander Mastro Valerio, Instructor in Drawing and Painting
288 Whittier Road

E. A. Wenz, Lieut., U.S.N.R., Instructor in Naval Aviation
Grosse Isle, Michigan

Donald A. Wilbur, A.B., Research Assistant in Engineering Research
1014 Cornwell Place

Walter Jefferson Williams, A.M., Instructor in Astronomy
717 East Huron Street

Roscoe LaRue Wood, B.S. in Arch., Instructor in Architecture
Jewett Avenue

Lloyd Arthur Young, A.B., Instructor in Physics
1721 Wells Street

Teaching Assistants

Laurence M. Ball, B.S.E., Teaching Assistant in Aeronautical Engineering
609 Monroe Street

Bernard M. Cain, B.S.E., Teaching Assistant in Electrical Engineering
1003 East Huron Street

John T. Eash, B.S.(Ch.E.), M.S.E., Teaching Assistant in Chemical Engineering
1016 Church Street

Clarence M. Ellicock, Ensign, U.S.N.R., Teaching Assistant in Naval Aviation
1022 Forest Avenue

Donald I. Finch, B.S.E., Teaching Assistant in Chemical Engineering
727 South State Street

David A. Fox, M.S., Teaching Assistant in Chemical Engineering
2001 Washtenaw Avenue
HAROLD J. GIBSON, B.S.E., Teaching Assistant in Mechanical Engineering
711 Catherine Street
CHARLES R. Harte, Jr., B.S.(Ch.E.), Teaching Assistant in Chemical Engineering
1215 Hill Street
RALPH W. HIGBIE, M.S.E., Teaching Assistant in Chemical Engineering
402 Awixa Road
WALTER KRAUSNICK, M.S., Teaching Assistant in Electrical Engineering
526 South Division Street
JAMES T. LENDRUM, Teaching Assistant in Architecture
608 East Madison Street
COIT W. MEAD, Teaching Assistant in Architecture
608 East Madison Street
CARL C. MONRAD, M.S.E., Teaching Assistant in Chemical Engineering
1506 Packard Street
CHARLES W. NISULA, B.S.E., Teaching Assistant in Electrical Engineering
807 Lawrence Street
VICTOR W. RANDLECKER, Ensign, U.S.N.R., Teaching Assistant in Naval Aviation
1122 Granger Avenue
KENNETH L. ROHRBACH, B.S.E., Teaching Assistant in Chemical Engineering
921 East Huron Street
JOHN W. SCHULTZ, M.S.E., Teaching Assistant in Chemical Engineering
1923 Geddes Avenue
ALEXANDER R. WElBB, Teaching Assistant in Civil Engineering
1327 Geddes Avenue
ROY R. WILSON, M.S.(Chem.), Teaching Assistant in Chemical Engineering
515 Walnut Street

Student Assistants

RALPH GOFF ABBOTT, Student Assistant in Mechanical Engineering
604 East Madison Street
PHILIP B. ALLEN, Student Assistant in Civil Engineering
1003 East Huron Street
EMIL M. ANDERSON, Student Assistant in Electrical Engineering
1333 Washtenaw Avenue
MARSHALL ANDERSON, Student Assistant in Engineering Administration
826 Tappan Avenue
HARRISON B. ANDREWS, Student Assistant in Civil Engineering
1746 Washtenaw Avenue
LEE ROBERT BAKER, Student Assistant in Engineering Mechanics
516 Walnut Street
GEORGE LUTHER BEARD, Student Assistant in Civil Engineering
1043 Baldwin Avenue
FRANCIS HASTINGS BEBEE, Student Assistant in Geodesy and Surveying
426 North Ingalls Street
SAM HENRY BENSKY, Student Assistant in Engineering Mechanics
1208 South University Avenue
MEMBERS OF THE FACULTY

CHARLES OLIVER BLOOM, B.S.E., Student Assistant in Civil Engineering 412 Huron Street
LESLIE CARL BORCHERT, B.S.E., Student Assistant in Chemical Engineering 511 Cheever Court
SEYMOUR JEROME CHENEY, Student Assistant in Mechanical Engineering 431 Thompson Street
HOWARD DAGER EDINGER COOLEY, Student Assistant in Engineering Mechanics 407 East Liberty Street
RAYMOND CALVIN DALY, Student Assistant in Geodesy and Surveying 523 Linden Street
PHILIP HOOPER DIETZ, Student Assistant in Mechanical Engineering 1135 Lincoln Avenue
ARMANDO DI GIULIO, Student Assistant in Chemical Engineering 517 East Washington Street
EDWARD FREDERICK FISCHER, Student Assistant in Chemical Engineering 730 Arbor Street
ALLAN DANIEL FORBES, Student Assistant in Electrical Engineering 613 Hill Street
ARTHUR HARLAND FRIS, Student Assistant in Mechanical Engineering 435 Thompson Street
FRANK KELSEY GERHART, Student Assistant in Architecture 1318 Forest Court
ROBERT NORRIS GRUNOW, Student Assistant in Geodesy and Surveying 1617 Washtenaw Avenue
ROBERT GEORGE HARRIS, Student Assistant in Mechanical Engineering 904 Oakland Avenue
VERNON GEORGE HAWKINS, Student Assistant in Geodesy and Surveying 807 South State Street
RALPH HUNT HOUGHTON, B.S.E., Student Assistant in Mechanical Engineering 531 Thompson Street
EDWARD SHERMAN JACKSON, Jr., Student Assistant in Engineering Mechanics 807 South State Street
HUMPHRY CEDRIC JACKSON, Student Assistant in Architecture 604 East Madison Street
KARL KAMMERMEYER, Student Assistant in Chemical Engineering 730 Arbor Street
KASIMIR KARPINSKI, Student Assistant in Engineering Shops 711 Haven Avenue
CARLE JAMES KIRCHGESSNER, Student Assistant in Civil Engineering 914 Hill Street
WARREN ALDEN KOERNER, Student Assistant in Architecture 818 Oakland Avenue
JOHN T. MCALLISTER, Student Assistant in Chemical Engineering 330 Maynard Street
PATRICK EDWARD MCCOUGHHEY, JR., Student Assistant in Electrical Engineering 1010 Olivia Avenue
JOHN S. MACDONALD, Student Assistant in Mechanical Engineering
1408 Washtenaw Avenue

NEIL EDWARD MACDOUGALL, Student Assistant in Civil Engineering
1808 Brooklyn Avenue

EMMETT WHITNEY MANNING, B.S.E., Student Assistant in Electrical Engineering
1319 North University Avenue

ROBERT WILDER MERSHON, Student Assistant in Civil Engineering
435 Thompson Street

JACK WILLIAM MILLS, Student Assistant in Architecture
803 South State Street

MADHUSUDAN MOZUMDAR, B.S.E., Student Assistant in Chemical Engineering
1017 West Liberty Street

TRESSE MUSIL, Student Assistant in Engineering Mechanics
1413 Shadford Road

ROBERT EDWARD NEIS, Student Assistant in Engineering Mechanics
420 Thompson Street

RICHARD FRANKLIN OUTCALT, Student Assistant in Architecture
608 East Madison Street

HERSCHEL FARR POWELL, Student Assistant in Mechanical Engineering
216 North State Street

JAMES DEYO REDDING, Student Assistant in Marine and Aeronautical Engineering
216 North State Street

HAROLD CLAYTON REYNOLDS, Student Assistant in Mechanical Engineering
916 Mary Street

WILLIAM CHARLES REYNOLDS, Student Assistant in Marine and Aeronautical Engineering
1601 Washtenaw Avenue

AUBREY HASTINGS ROBSON, B.S.E., Student Assistant in Mechanical Engineering
915 Sybil Street

FRANK ALBERT ROWE, Student Assistant in Chemical Engineering
727 South State Street

MARTIN MICHAEL SADLON, Student Assistant in Chemical Engineering
1524 Geddes Avenue

J. KENNETH SALISBURY, B.S.E., Student Assistant in Mechanical Engineering
1227 South University Avenue

J. RAY SCHMIDGALL, Student Assistant in Marine and Aeronautical Engineering
1201 East University Avenue

HOMER CARLISLE SKILLCORN, Student Assistant in Geodesy and Surveying
509 Sauer Court

HOWARD FRANCIS STOREN, Student Assistant in Geodesy and Surveying
1805 Washtenaw Avenue

CHARLES WOLFE SUNDAY, Student Assistant in Civil Engineering
1043 Baldwin Avenue

HERMAN GEORGE TER MEER, Student Assistant in Electrical Engineering
522 Elm Street

WARNER GLEASON VAUGHAN, Student Assistant in Engineering Shops
714 Haven Avenue
MEMBERS OF THE FACULTY

Ivan Joyce Wanless, Student Assistant in Mechanical Engineering 1003 East Huron Street
Dale I. Watkins, Student Assistant in Engineering Mechanics 114 Pauline Boulevard
Byron Stephen Wells, Student Assistant in Mechanical Engineering 723 Oakland Avenue
Edward Freeman Yendall, Student Assistant in Mechanical Engineering 515 Walnut Street

STANDING COMMITTEE

COMMITTEES OF THE COLLEGE OF ENGINEERING

Committee on Classification:

Committee on Delinquent Students:
Professors H. W. King, J. H. Cannon, R. S. Hawley

Committee on Discipline:
Professors G. W. Patterson, A. H. Lovell, A. Marin

Committee on Extension of Time:
Professors C. O. Wisler, R. A. Dodge, J. M. Nickelsen

Committee on Fellowships and Loans:
Professors H. W. Miller, J. C. Brier, Peter Field, Dean H. C. Sadler, ex officio

Committee on Hours:
Professors O. W. Boston, J. H. Cannon, F. R. Finch

Committee on Substitution:
Part II

GENERAL INFORMATION

COLLEGES OF ENGINEERING AND ARCHITECTURE

HISTORY

1. The University of Michigan, founded in 1817, is a part of the educational system of the State, and derives from the State the greater part of its revenue. The University comprises the Colleges of Literature, Science, and the Arts, of Engineering, of Architecture, of Pharmacy, the School of Dentistry, the Medical School, the Law School, the School of Education, the School of Business Administration, the School of Forestry and Conservation, the University School of Music, and the Graduate School, each of which publishes a separate annual announcement. The various Faculties include over eight hundred officers of instruction, and several hundred assistants, some of whom participate in the work of teaching. About 13,000 students, representing all the states and territories and many foreign countries, were registered at the University of Michigan during the last year.

In the legislative act of 1837, under which the University was organized in its present form, provision was made for instruction in engineering. There are few older technical schools in the United States. The first professor of civil engineering was appointed in 1853, and the first degrees were conferred in 1860. The engineering courses were included in the College of Literature, Science, and the Arts until the close of the collegiate year 1894-1895. At that time the College of Engineering was established by the Board of Regents as a separate Department of the University.

Instruction in Architecture was organized as a sub-department of the College of Engineering in 1906. In 1913 the College of Architecture was given control of its programs of study, and, in general, charged with the administration of its affairs.
The aim of the Colleges of Engineering and Architecture is to lay a foundation of sound theory, sufficiently broad and deep to enable their graduates to enter understandingly on a further investigation of the several specialties of the engineering and architectural professions; and at the same time to impart such a knowledge of the usual professional practice as shall make the students useful upon graduation in any subordinate position to which they may be called. While the adaptation of theory to practice can be thoroughly learned only by experience, there are many matters in which the routine work of an engineering field party, office, or drafting room can be carried out, on a greater or less scale, in a training school. The technical branches are under the direct charge of those who have had professional experience as well as a full scientific training. The instruction fits the students, as far as possible, for the requirements of active practice. The Department of Engineering Research was established in 1920. The general function and purpose of this department is to co-operate in every proper manner with the industries of the state.

2. Students at the University of Michigan enjoy many privileges outside their curriculum. The Student Christian Association and the Ann Arbor churches minister to the spiritual, religious, and social needs of the student body; the pastors and assistant ministers have largely been chosen because of their effective work with young people.

The University Musical Society, affiliated with the University, provides unusual musical advantages, including several series of concerts, either at moderate price or without charge, in which leading artists of the country and from abroad and local musicians take part. The University has in its galleries a small art collection of great merit, and the Ann Arbor Art Association gives during the year several loan exhibitions.

University lectures are given without charge throughout the year by scientists, publicists, men of letters, and others; the Oratorical Association conducts a series of lectures at moderate prices in which important lecturers appear.
3. The College of Engineering has four-year programs of study in aeronautical, chemical, civil, electrical, and mechanical engineering, geodesy and surveying, naval architecture and marine engineering, astronomy, engineering mechanics, mathematics, and physics.

The work offered by the several departments is usually broader than the name of the department may indicate. For example, under Chemical Engineering will be found metallurgical, industrial, and general chemical engineering; under Civil Engineering will be found structural, hydraulic, transportation, sanitary, and municipal engineering; under Electrical Engineering will be found power, communication, and illumination engineering and electrical design; under Geodesy and Surveying will be found geodesy, topographic and boundary surveying, and courses on the legal and administrative problems involved in titles and boundaries; under Mechanical Engineering will be found steam power, internal combustion, hydromechanical, heating, ventilating and refrigerating, automobile, and industrial engineering, and machine design; under Naval Architecture and Marine Engineering will be found in addition water transportation.

Related to transportation engineering is the subject of transportation. A curriculum in this subject is now being prepared to be offered in 1930-1931. The University of Michigan is very fortunate in having unusual facilities for the study of transportation, including a special transportation library containing 75,000 books and pamphlets, and departments offering instruction in aeronautical, automobile, marine, railway, highway, and electrical engineering—including the design and construction of vehicles of transportation and of electric communications (telephone, telegraph, and radio)—and in economics, business administration, and other subjects of importance to the student of transportation. The proposed curriculum will have as a foundation the courses common to the present professional curricula. For further information write the College of Engineering.

In co-operation with the School of Business Administration the College has five-year programs in chemical and industrial engineering, electrical and industrial engineering, and mechanical and industrial engineering.
Also engineering students who have completed at least three years of prescribed work with an average grade of 2.0 may transfer to the School of Business Administration, provided they have completed not less than 90 semester-hours including 18 hours of economics (not less than 6 hours in economic principles and 6 hours in accounting). On the satisfactory completion of two years of work in that School they may be granted the degree of Master of Business Administration.

The College of Engineering, in co-operation with the Law School, offers a six-year engineering-law curriculum in which a student spends three years in the College of Engineering and then enters the Law School. On the satisfactory completion of his pre-law work and that of the first year's program in the Law School, he receives the degree of Bachelor of Science in Engineering; on satisfactory completion of the law curriculum, he receives the law degree. A student who transfers to the Law School without completing the first three years of the engineering-law curriculum does not receive the degree in Engineering. For details see Section 83.

The Civil Engineering Department offers a co-operative program in highway engineering in which the summer is spent with the highway department of the state or of an important county.

The Electrical Engineering Department offers a five-year co-operative program with industry, conforming substantially to the following principles:

Co-operative relations will be established only with such industries as are able and willing to offer a definite program of graded work of educational value. The student will undertake the co-operative work during periods of an entire semester or an entire summer session. Credit for the co-operative work will be given only on completion of the entire prescribed course.

The College of Architecture offers four-year programs in architecture, architectural design, architectural engineering, and decorative design, and a two-year program for special students in architecture.

The programs in engineering are described in Part V, those in architecture in Part VI of this Announcement.
COMBINED PROGRAMS WITH OTHER INSTITUTIONS

4. The College of Engineering has an agreement with Albion, Olivet, and Battle Creek Colleges, and the College of the City of Detroit, under which a student who has been in residence at one of these colleges for three years and has completed with a good record a prearranged program including substantially the work of the first two years of the College of Engineering may be admitted to the College of Engineering, and after two additional years be graduated in engineering.

A college under this agreement accepts the first year at the College of Engineering in lieu of its senior year, and if the student’s record is satisfactory graduates him.

FRESHMAN WEEK

5. During the week before the opening of school, the campus is virtually turned over to the freshmen. All freshmen admitted from high school are required to attend the functions of Freshman Week. During this period, routine matters, such as payment of fees, medical examination, and classification are handled in such a way that waiting in long lines is eliminated as far as possible. In addition, many special features, such as talks, sings, mixers, inspection trips, and discussion groups are included, the whole purpose being to give the student a proper introduction to his University experience. Further detailed information is furnished to each freshman on acceptance of his application.

During the Week, each group of fifteen or twenty freshmen is placed in charge of a faculty Adviser.

THE ACADEMIC YEAR AND SUMMER SESSION

6. The academic year extends from September 29, 1930, to June 22, 1931. The Summer Session, between the student's first and second, second and third, or third and fourth years, extends eight weeks, from Monday following Commencement (June 30 to August 22, 1930).

Every student in the College of Engineering, in order to finish his program in four years, is expected to attend one Summer Session.
Students enrolled in the College of Architecture must spend four months in an architect's office before graduation, receiving four hours credit for this practical experience.

**SUGGESTIONS AND DIRECTIONS**

7. New students expecting to take the examinations for admission to the University the first semester must present themselves September 22-26, 1930; for the second semester, February 12-14, 1931.

All freshmen are required to report on Tuesday, September 23, for registration and the activities of Freshman Week. No freshman will be excused from attendance during Freshman Week except on account of illness. A complete program will be furnished to all freshmen accepted for admission.

Students on arriving in Ann Arbor can obtain information in regard to rooms and board by calling at the office of the Dean of Students, Room 2, University Hall. His secretaries are actively interested in assisting newcomers to find rooms and boarding places, and conduct a free employment bureau for the benefit of students.

When admitted, every student will be furnished with a booklet containing directions for subsequent procedure.

**ADMISSION**

8. The requirements for admission are the same for all students in Engineering and Architecture.

Applicants must be at least sixteen years of age, and must present satisfactory evidence of good moral character. For freshmen, the record of work done in the preparatory school must be presented on a form to be obtained from the Registrar of the University; for students transferring from other colleges, the transcript of record usually includes a satisfactory statement.

Students may be admitted on certificate, by examination, on credits from another college, or by a combination of these. They may also be admitted as special students.
FOREIGN STUDENTS

9. All students whose native language is other than English shall, upon matriculation and registration in the College of Engineering, be required to report at once to Professor J. R. Nelson, Chairman of the Committee on English for Foreign Students. Such students shall satisfy the Committee that they possess a sufficient knowledge of English to carry on work in the College of Engineering, before they may be classified.

On the recommendation of the Committee they may be referred to the proper classifier who will give them such a program of work as he deems best. For his first semester, however, every foreign student is considered as on trial. If at the end of the semester he passes his work, credit will be given; if, however, in spite of conscientious effort, he fails, and his difficulties are, in the judgment of his instructors and of the Committee on English, due primarily to his lack of facility in the use of the English language, his record will be disregarded but he will then be remanded to the Department of English for such work in English as he needs, to the limit of eight hours.

If a student is judged by the Committee on English to be unfitted even for such a trial program as that outlined above, he will be required to take for one semester such work in English as the Committee thinks necessary, and may be allowed to visit such classes as may in the judgment of the Committee be profitable to him.

No advanced credit will be granted foreign students until they have been in residence at the University at least one semester.

REQUIREMENTS FOR ADMISSION

10. Requirements for admission are stated in units, a unit being defined as a course covering an academic year and including in the aggregate not less than the equivalent of one hundred and twenty sixty-minute hours of classroom work. Two to three hours of laboratory, drawing, or shop work are counted as equivalent to one of recitation.

Applicants for admission as freshmen without deficiencies must present fifteen high school units, including the following:
ENGINEERING AND ARCHITECTURE

GROUP I—10 UNITS

For admission to the Colleges of Engineering and Architecture, all of the following must be presented:

English .......................................................... 3 units
   (Grammar, Composition, Classics, History of English Literature)
Mathematics .................................................... 3 units
   (Algebra, through quadratics; Geometry—Plane, Solid, and Spherical)
Physics .......................................................... 1 unit
History .......................................................... 1 unit
Greek, Latin, German, French, or Spanish—one of these. 2 units

GROUP II—1½ OR 2 UNITS

One and one-half or two units also in any one of the following combinations must be presented. The first combination is urgently advised.

Trigonometry ...................... ½ or
Chemistry ......................... 1
   or
Chemistry ......................... 1
Foreign Language

For students entering the College of Architecture, Freehand Drawing may be substituted in Group II.

GROUP III—3½ OR 3 UNITS

The remaining 3 or 3½ units may be presented in any subjects for which credit toward graduation is given by the accredited school and which are taught in a manner approved by the University.

NOTES ON THESE REQUIREMENTS

English.—Four units of English should always be presented whenever it is possible to do so.

Language Requirement.—Some modifications of the language requirement may be allowed in the case of students whose native tongue is other than English. These cases will be considered individually.
Chemistry and Trigonometry.—It is urgently advised that 1 unit of Chemistry and \( \frac{1}{2} \) unit of Trigonometry be included in the fifteen units offered for admission. The student who presents the full requirements without Chemistry and Trigonometry must take Chemistry 3 and Mathematics 8 in his first college year, which may necessitate more than the usual time to complete the graduation requirements. Chemistry and Trigonometry are offered in the Summer Session to accommodate those students who wish instruction in them before entering college.

Biology.—Biology is defined as one-half year of Botany and one-half year of Zoology; hence Biology cannot be accepted from an applicant who offers at the same time a unit in either, or both, of these subjects.

College of Architecture.—In order to enter the College of Architecture under the most favorable conditions, the fifteen units offered for admission should include the following: English, 3 units; Mathematics (including plane trigonometry), 3\( \frac{1}{2} \); Physics, 1; Chemistry, 1; History, 1 or more; Modern Languages, 2 or more; Freehand Drawing, 1 or more; Manual Training, \( \frac{1}{2} \) or 1.

11. Vocational Units.—No more than three of the fifteen units required for admission will be accepted in vocational subjects and no more than two units in any one of them.

In Drawing and Manual Training, a unit means the equivalent of at least 360 periods, not less than forty-five minutes each.

All applicants must send prospectuses of the courses of study or letters from instructors describing the work done when credit is asked in the vocational subjects,—Manual Training, Drawing, Agriculture, and Commercial Branches. In general, the standards set up by the Commission on Accredited Schools and Colleges of the North Central Association of Colleges and Secondary Schools will be recognized in adjusting high school credits in vocational studies.

Drawing.—Freehand Drawing, one-half or one unit allowed. The student should show that he can represent correctly, in outline and in light and shade, geometric and simple natural or decorative form. Accuracy of proportion and perspective is essential. Pencil, charcoal, or brush may be used.

Mechanical Drawing, one-half or one unit allowed. This work should cover:

(a) Exercises giving evidence of skill in the use of instruments and knowledge of materials used. The exercises should consist mainly of the accurate geometrical construction of the more important plane curves, with simple problems involving tangents and normals to the same.
(b) Graded exercises in the orthographic projections of simple geometrical forms and working drawings of some of the more elementary constructions in wood and metal, all fully dimensioned, and in which the conventional signs are properly used.

(c) Exercises in line shading, shade lining, and cross hatching, together with a reasonable skill in lettering.

Design, one-half unit allowed. In this work a student should demonstrate some knowledge of the principles of design and the ability to apply them. The exercises should consist of compositions of straight and free curved lines and simple shapes and their use in the design of simple objects, such as book covers, etc. The exercises may be in black and white, various values, or in colors, and may consist in part of objects executed in wood or metal, and the like.

Students who intend to study architecture are advised to offer one unit in drawing. This may consist of work in free-hand drawing, mechanical drawing, design, or a combination of two of these.

Manual Training.—Not more than two units will be accepted. The work accepted may be:

- Bench work, wood turning, cabinet making, and pattern making in the wood working laboratory.
- Manufacturing of wrought iron and steel, effects on structure due to working, heat treating and equipment, case hardening, welding and brazing, protective coatings, etc.

Commercial Branches.—Not more than a total of two units will be accepted in commercial branches, to be selected from the following list:

Advanced Arithmetic, one-half unit. Credit will be allowed for arithmetic only if taken after at least one semester of algebra.

Double Entry Bookkeeping, one-half or one unit. If credit to the extent of a full unit is sought, the student should devote at least ten periods of not less than forty-five minutes each in class each week for one academic year. The applicant should have a working knowledge of single and double entry bookkeeping in the usual lines of business. He should understand the use of the various books, such as the journal, cash book, sales book, invoice book, ledger, and special column journals and cash books. He should know how to prepare profit and loss statements and balance sheets, and to explain the meaning of the terms involved in both kinds of statements.
Commercial Geography, one-half unit. The amount and character of work accepted in this subject is indicated by the scope of the best textbooks on the subject.

Industrial History, one-half or one unit. The scope of this work is indicated by such texts as Cheyney or Cunningham in English industrial history, or Wright, Coman, or Bogart in American history.

Elementary Economics, one-half unit. The applicant should have a knowledge of the leading facts and principles in Economics, including such subjects as division of labor, the factors of production, the law of diminishing returns, demand and supply, value and prices, and international trade. One of the better elementary texts in use will serve as a basis. This should be supplemented with discussions and problems.

Agriculture.—One or two units. Recitations and laboratory work in the various divisions of agriculture, including farm crops and horticulture, animal and dairy husbandry, soil physics, soil fertility, and farm mechanics. The study should be preceded by a course in Botany.

ADMISSION ON CERTIFICATE

12. Only those applicants are admitted on certificate who are officially recommended graduates of high schools accredited to this University and have completed a full four-year curriculum in a standard high school, covering at least fifteen units of acceptable entrance credit.

The list of high schools accredited to the University of Michigan does not necessarily include those accredited to or affiliated with other universities or colleges.

It is expected that the principal will recommend not all graduates, but only those whose character, ability, application, and scholarship are so clearly superior that the school is willing to stand sponsor for their success at the University. The grade required for recommendation should be distinctly higher than that for graduation.

It is recommended that graduates from preparatory schools enter at once. If they do not, they must present evidence that they are, at the time of admission, prepared to do the work of the Colleges. They must show satisfactory preparation especially in mathematics, in English, and in the modern language presented
for admission. This preparation may be shown by certificates of work done since graduation; by examinations at Ann Arbor, September 22 to 26, 1930; or by attendance at the Summer Session, June 30 to August 22, 1930, with a satisfactory record of eight hours of work, a part of which must be in mathematics.

College credit may be given for studies presented in excess of the fifteen units required for admission, if these subjects are deemed equivalent to similar courses in the University. Such credit will be adjusted after admission. As a general rule no advanced credit will be given for work done in the usual high school course.

A student who for any reason has failed to secure a certificate of graduation and his principal's recommendation will be required to pass the regular examinations for entrance in all subjects.

Applicants for admission should secure an application blank either from the high school principal or from the Registrar of the University. The completed blank should be sent direct to the Registrar by the principal as soon as possible following the applicant's graduation from the high school. If, on inspection, the data and recommendation are found satisfactory, the Registrar will forward a permit to register to the applicant entitling him to admission without examination, contingent only upon the passing of a satisfactory medical examination. This permit is to be presented in person at the time of registration.

Certificates from schools other than those officially approved by the University do not excuse an applicant from the admission examinations.

ADMISSION BY EXAMINATION

13. Fifteen units are required for admission. Eleven and one-half or twelve units are prescribed. The other three and one-half or three units may be presented in the subjects mentioned under admission requirements in section 10. In general, applicant will not be admitted with deficiencies in more than one and one half units of the prescribed units.

An outline of the preparatory work which a student should cover before presenting himself for examination in any one of these subjects is given at length in the Annual Report of the Division of University Inspection of High Schools. This will b
mailed upon application to the Registrar of the University. Specimen entrance examination questions are not furnished.

The principal examinations for admission will be held in June and September, 1930, at the University. Another opportunity is offered in February, 1931. Applicants will not be examined at any but the regular time except on payment of a special fee of five dollars for examination in one or more subjects.

Candidates for admission who have passed College Board, New York State Regents, or Canadian Matriculation Examinations with satisfactory grades will be excused from further examinations in the subjects covered.

Applicants for admission on examination should make arrangements with the Registrar at least one month in advance of the time set for the examination.

An applicant who fails in some part of the examination, but passes fifteen units, may be admitted provisionally; but all deficiencies must be made up within one year.

ADMISSION TO ADVANCED STANDING

14. A student in another college or university who intends to enter the College of Engineering or of Architecture with advanced standing should examine carefully the curriculum of the Department in which he intends to specialize, and arrange his work accordingly.

As a rule he should have completed the required work in English, foreign language, mathematics, physics, chemistry, and cultural subjects, and in drawing and engineering mechanics if his institution offers adequate instruction in them.

He is advised to write to the Head of the Department in which he wishes to specialize for advice and for information not found in this bulletin. The Associate Dean of the College of Engineering or the Professor of Architecture will be glad to give information concerning admission requirements or other matters of a general nature.

Students who receive on admission less than 24 hours of advanced credit, are tentatively considered as freshmen; those presumably to be graduated within one year are considered as seniors; other entering students will be considered as sophomores
until they have been in residence one semester and have satisfied
the requirement for recognition as upperclassmen, for which see
section 32.

(a) Graduates of the University and of other approved col-
leges are admitted without examination to advanced standing as
candidates for a degree in Engineering or Architecture.

They should present to the Associate Dean or, for Archi-
tecture, to Professor Lorch an official certificate of their gradu-
ation—not their diploma—and an official copy of the record of
the studies they have completed, showing the subjects studied,
the number of weeks devoted to each, and the number of class
periods a week.

The remaining requirements for students of Engineering can
usually be completed in two years, if the student takes as electives,
while an undergraduate,* the mathematics required of Engineer-
ing students and Courses 1, 2, and 3 in Drawing.

Those students who hope to complete the program in Archi-
tecture in two years should also complete the equivalent of Draw-
ing 21, 22, and 23, and Architecture 1, 4, 5, 6, and 21.

A student who has completed a regular four-year course at an
approved college or other institution may be admitted to the Col-
leges of Engineering and Architecture as a senior provided that,
in general, the course completed has covered substantially the
equivalent of the required work in the first three years of the
program he desires to follow at the University of Michigan. The
courses to be taken during residence at the University will depend
upon the previous training and will be determined by the Head of
the Department concerned, subject to the approval of the Com-
mittee on Combined Courses. Upon the satisfactory completion
of such courses, covering at least one year's residence, the student
will be recommended for the degree of Bachelor of Science in En-
gineering or Bachelor of Science in Architecture.

(b) A student who has completed at least one year of work
in an approved college may be admitted to advanced standing with-
out examination, except such as may be necessary to determine
what credits he is entitled to receive.

*A student enrolled in the College of Literature, Science, and the Arts,
who desires to elect, in the College of Engineering or Architecture, any
course which is not printed in the Literary Announcement, must obtain the
written permission of the Assistant Dean of the Literary College.
ADMISSION TO ADVANCED STANDING

An applicant must present a letter of honorable dismissal from college, an official copy of his college record, and an official record of his preparatory studies, similar to those required of students admitted on certificate. See section 12.

(c) A student who has not completed a year's college work in an approved college, but before entering the University has pursued studies beyond those required for admission, may be admitted to advanced standing. Entrance requirements in such cases may be satisfied by complying with the conditions stated in either section 12 or 13.

ADMISSION ON COMBINED PROGRAMS

15. Students who have completed the first three years of the combined programs arranged by the College of Engineering with Albion, Olivet, and Battle Creek Colleges and the College of the City of Detroit, are admitted as juniors. For the admission of other students from these colleges see the regulations in section 14.

ADJUSTMENT OF ADVANCED CREDITS

16. All advanced credits are adjusted by the Associate Dean or the Professor of Architecture; and until a transcript of record at another institution or other like information is furnished, no one is authorized to say what credit may be given for work done elsewhere or what class a student may enter after having attended another college for a specified time.

The requirements for admission must be complied with before any advanced credit is given.

Advanced credit is given only upon examination or upon an official transcript covering the work done, and showing the scholarship or proficiency attained.

Advanced credit is given only for work equivalent to courses offered in the University of Michigan.

Applicants for admission in engineering should apply at the time of entrance at Room 255, West Engineering Building; and in architecture at the office of the College of Architecture, Room 207, Architecture Building. It is desirable that credentials should be sent on as far in advance of registration week as practicable.
Students desiring advanced standing in drawing must bring all drawings completed previous to entrance.

Advanced credits should be secured upon entrance. To apply for advanced credit at a later date, students of Engineering must secure the permission of the Associate Dean, and students of Architecture the permission of the Professor of Architecture, giving a satisfactory reason for the delay in making the application.

ADMISSION AS GRADUATE STUDENTS

17. Higher degrees in Engineering and in Architecture are conferred in the Graduate School of the University. See the Announcement of the Graduate School.

ADMISSION AS SPECIAL STUDENTS

18. Students who are pursuing work in these Colleges, and are not candidates for a degree, are designated Special Students.

Persons over twenty-one years of age who wish to pursue particular studies in Engineering or Architecture, and who show by examination or by the presentation of satisfactory certificates that they are prepared to do good work in the selected courses, may be admitted as special students on the recommendation of the heads of the departments of instruction in which they wish to study. The object of this rule is to enable young men who are beyond the high-school age to secure technical training along special lines when they are properly prepared for the work. Two or more years of successful experience as teacher, draftsman, surveyor, engineer, or operative in engineering work will be given considerable weight in determining the fitness of the candidate. In general, a good working knowledge of English, algebra, and geometry is required in order to succeed in engineering studies. Applicants for admission as special students should send as early as possible to the head of the department concerned letters of recommendation, certificates of scholarship, and an exact statement of the courses desired.

A two-year course is provided for special students in Architecture. Such students must be qualified for the courses they wish to pursue and must have the approval of the Head of the
College of Architecture; they must be twenty-one years of age; must have had two or more years of experience in an architect's office, or its equivalent, and must have a practical knowledge of architectural drawing. Special students who wish to pursue courses in advanced building construction must present the regular entrance requirements in mathematics. Students who desire to pursue a special course in Architecture should write to Professor E. Lorch as early as possible in order to learn how best to prepare for the work they may wish to do here. They should spend some time in study parallel with their office work before taking up university work, thus to review or master essential preparatory subjects and again to acquire the habit of study, the loss of which in certain subjects is often a serious handicap to capable draftsmen otherwise well prepared to profit by some of the academic work. In general, a working knowledge of English, algebra, and plane and solid geometry is required. Advanced credit can often be given such students for work done in the field and in offices.

College graduates are also admitted as special students and may take those courses for which their preparation is sufficient.

Candidates for admission as special students in either College should state their age and what their education and experience have been. They should send letters of recommendation from former employers and bring drawings to demonstrate their experience and ability.

Special students pay the same fees as regular students. Their work is assigned and regulated by the heads of the departments of instruction in which they register.

A special student may become a candidate for a degree by fulfilling the regular requirements for admission. See section 10.

A student who is a candidate for a degree cannot become a special student without the permission of the Faculty.

FEES AND EXPENSES

19. *The Matriculation Fee and the Annual Fee must be paid in advance for the entire year, and no student can enter upon his work until after such payment.*

**Matriculation Fee.**—Every student before entering any College or School of the University is required to pay a matricula-
tion fee. This fee, which for citizens of Michigan is ten dollars, and for those who come from any other state or country, twenty-five dollars, is paid but once, and entitles the student to the privileges of permanent membership in the University.

**Annual Fee.**—In addition to the matriculation fee every student has to pay an annual fee for incidental expenses. The annual fee in the Colleges of Engineering and Architecture is, for Michigan students, $108; for all others, $133. The fee for the second semester is sixty per cent of that for the entire year.

These fees cover class instruction, use of libraries, outdoor physical education and admission to all athletic events, membership in the Michigan Union or Michigan League, as well as medical attention from the University Health Service and dispensary.

**Part-Time Fees.**—Persons whose occupations are such as to afford them only a limited part of their time for study, but who are duly accredited for admission to any College or School of the University and who also give evidence of an interest in study wholly accordant with the purpose of the College or School to which they are accredited, may be admitted and may elect not more than a total of ten hours in one academic year and not more than six hours in any one semester, upon the payment of an annual fee of $25. Such students, if entering the University for the first time, must also pay the usual matriculation fee. The part-time fee of $25 covers only the usual privileges of study and tuition; Michigan Union or Michigan League membership, outdoor physical education, and Health Service are not included. These special privileges may be secured by paying the appropriate extra fees at the time of registration.

**Late Registration.**—Registration (i.e., enrollment, payment of fees, and classification) must be entirely completed before the first day of the semester. Students failing to complete their registration before the first day of each semester are required to pay a late registration fee of five dollars.

**Fee for Special Entrance Examination.**—An applicant for admission who desires to take the entrance examination at a time other than that announced is required to pay to the Treasurer a fee of five dollars before permission to take one or more exam-
FEES AND EXPENSES

Inations can be granted him. A supplementary examination given at any other time than that stated in this Announcement will be subject to the same fee.

Graduation Fee.—The fee for graduation is ten dollars, and the by-laws of the Board of Regents prescribe that no person shall be recommended for a degree until he has paid all dues, including the graduation fee. This fee will be received by the Treasurer of the University upon the presentation of a ticket to be secured at the office of the Secretary of the College in which the candidate is enrolled. To receive a degree at Commencement the candidate must be present in person and must have paid the graduation fee at least twenty-five days prior to Commencement Day. Others who have satisfied all the requirements for graduation, including the payment of the graduation fee, will receive their degrees at a subsequent meeting of the Board of Regents.

Laboratory Fees.—Laboratory fees are abolished, but students in laboratory courses must make a cash deposit to pay for materials used and for breakage.

Camp Fee.—A fee of ten dollars, in addition to the regular tuition for the Summer Session, is required of students who take Course 3 in Surveying (at Camp Davis).

Other Expenses.—There are no dormitories for men and no commons connected with the University. Students obtain board and lodging in private families. Room rent varies from four to six dollars a week for each student. The cost of board ranges from eight dollars a week upward.

Annual Expenses.—The expenses of the average student, during his first year in the College, not including clothing, railroad fare, and vacations, are estimated at $828 for residents of Michigan, $868 for non-residents. By practice of strict economy it may be possible to keep these expenses within $3,000 for the four years. Many students are enabled to complete their course by withdrawing for a year or two to earn money to carry them through the remaining years.
A set of drawing instruments costs from $18 to $32, and, if well selected, will be serviceable for many years. The set should not be bought before coming to Ann Arbor.

The cost of attending the Camp Davis Summer Session is about $125. See section 78.

**REFUNDING OF FEES**

20. (a) No student will be entitled to a refund except after the surrender to the Secretary of the University of the student's original receipt from the Treasurer of the University and the surrender of all tickets issued to such student for athletic events not yet having occurred, and the Michigan Union or Michigan League membership card. Students should scrupulously preserve all receipts, as in case of loss of the receipt $5 will be deducted from the refund as a penalty.

(b) No refund will be granted unless applied for within one year after withdrawal.

(c) No refund or reduction of matriculation fee is made except in case of withdrawal within the first two weeks after registration.

(d) A student who withdraws not more than two weeks after his registration shall be entitled to a refund of his entire annual fee, together with the matriculation fee.

(e) A student who withdraws more than two weeks and less than eight weeks after his registration is entitled to a refund of one-half his annual fee.

(f) A student who withdraws more than eight weeks after the beginning and not later than the end of the semester of registration is entitled to a refund of 40 per cent of his annual fee.

(g) The 40 per cent refund to students enrolling at the beginning of the second semester by permitting them to register for 60 per cent of the annual fee shall be included in determining any further refund to withdrawing students under (d) and (e) above.

(h) A student who transfers at the beginning of the second semester from one School or College to another in which the annual fee is higher shall be required to pay an additional amount sufficient to bring the total fee to that in the latter School or College.

(i) A student enrolling during the second semester in a different School or College from that in which he was enrolled during the first semester shall not be required to pay a total annual fee in excess of the higher annual fee in these two divisions of the University.

(j) Refunds for Summer Session or short courses will be made pro rata on the basis of the foregoing rules.
SELF-SUPPORTING STUDENTS AND STUDENT EMPLOYMENT

21. The normal number of hours that students should carry each semester is between sixteen and eighteen. Students who support themselves wholly or in part are urged to elect a smaller number of hours. It is very difficult for a student supporting himself to carry a full schedule and retain his health. It is even more difficult under such conditions to carry a full schedule and do justice to his college work.

The University does not undertake to furnish manual labor to students; yet a considerable number find opportunities in the city to meet a portion of their expenses. The Faculty suggests to such students that they should not attempt to carry the full amount of work outlined. Much more efficient work can be accomplished by taking a longer time to cover the course. Each student doing outside work should notify the Classification Committee of such fact at the time of classification.

Students desiring employment should apply in person or by letter before they come to Ann Arbor, to the Dean of Students, Room 2, University Hall.

FELLOWSHIPS AND SCHOLARSHIPS

22. There are several fellowships and scholarships in the Colleges of Engineering and Architecture. For details see sections 44-45 and 115, or the bulletin on Scholarships, Prizes, and Loan Funds.

There are also appointed annually about thirty-five assistants at salaries ranging from $100 to $250. For the most part, these assistants are graduate students and seniors who have shown themselves proficient in certain lines.

RELATION OF STUDENTS TO THE CIVIL AUTHORITIES

23. Students are temporarily residents of the city, and, like all other residents, are amenable to the laws. If guilty of disorder or crime, they are liable to arrest, fine, and imprisonment. A rule of the University Senate provides that, if a student is arrested, or is convicted by the civil authorities, he shall be cited to appear
before the Discipline Committee of the University or Faculty of the College in which he is matriculated, and shall be liable to suspension or expulsion.

THE MICHIGAN UNION AND THE MICHIGAN LEAGUE

24. The University of Michigan Union was organized and incorporated under the laws of the State of Michigan in 1904 to establish a University social center, to provide a meeting place for faculty, alumni, and students of the University, to furnish a home for alumni when in Ann Arbor, and a place for wholesome relaxation for students. As a social center it encourages and stimulates activities that are for the welfare and enjoyment of the student body, thus fostering a richer, more intense University life, a product of the student’s own work. In recognizing neither artificial barriers nor distinctions, the Union serves as a democratizing influence in the student body; in emphasizing the social value of education, it complements the work of the University in its endeavor to graduate broadly educated men and good citizens. Membership in the Union is restricted to men.

The Union Building is exceptionally well appointed. Among its many attractions are a swimming pool, six bowling alleys, a barber shop, a billiard room with twenty-four tables, a lounging room, restaurant service including a cafeteria, a women's dining-room, a main dining-room, and an assembly hall adapted to use for banquets, meetings, conventions, smokers, concerts, and dances, and forty-nine sleeping rooms for the alumni and guests of members accommodating sixty-eight persons.

The student annual membership fee is $10, fixed by the Board of Directors and by resolution of the Board of Regents. This fee is incorporated in the annual fee of every male student of the University.

The Michigan League Building, erected by alumnae and friends of the University and completed in 1929, provides for the women of the University a clubhouse similar in scope to that of the Michigan Union for men. Every woman attending the University pays, in her tuition, a fee of ten dollars, which entitles her to all the privileges of the League and at the end of her four years of college automatically secures for her a life membership with no further dues.
UNIVERSITY HEALTH SERVICE

25. The University of Michigan is fundamentally interested in the general health and physical welfare of its students. The University Health Service endeavors not only to provide advice and treatment for students whose physical condition is below normal but also to protect and improve the condition of the normally healthy student.

A corps of physicians and nurses is available in the Dispensary daily to provide free office medical attention and ordinary medicines to ambulatory patients. Any student may consult any physician of the staff at choice. Prescriptions are filled in the Health Service Pharmacy. The staff of the Health Service includes several physicians who are also on the University Hospital staff, so that abundant opportunity is afforded for co-operation and consultation with specialists. A dentist on the staff cooperates with the Dental Clinic where care and treatment of the teeth are given.

The Health Service Infirmary provides physicians, nurses, and equipment for the free bed-care of twenty patients; other cases are referred to the University Hospital when necessary.

Health Service physicians are on scheduled duty to make calls upon ill students at their rooms. For this service a minimum fee is charged.

The Health Service provides service during the Christmas and Spring vacations.

All Summer School students who have paid the Health Service fee, have the usual privileges at the Health Service.

FACILITIES FOR PHYSICAL EDUCATION

26. The University is provided with excellent gymnasiums, the Waterman Gymnasium for men, and the Barbour Gymnasium for women. The main floor of the Waterman Gymnasium, which is a rectangle with truncated corners and dimensions of 246 by 90 feet, is well equipped with the various kinds of apparatus usually found in the best modern gymnasiums. A number of smaller rooms are devoted to administration, fencing, boxing, and other special purposes, while the basement is given up to baths, lockers, handball, and boxing. The main hall is lighted in the daytime by
means of a large skylight 60 feet above the floor, and in the evening by electricity. A gallery makes room for an elliptical running track, ten laps to the mile, making it one of the largest gallery running tracks in the country.

All men entering the University for the first time are given a thorough medical and physical examination before University fees are paid. At this time also a measurement of various parts of the body is taken and plotted on an Anthropometric Chart. A comparison with the average measurements can be made in this way, and any existing abnormalities corrected. A second measurement is taken after class work is finished, in order to note what changes have taken place. Abnormal posture conditions are corrected, and special exercises for strengthening weak parts are given. Realizing the fact that most college men have inferior chest development, the character of the class work is arranged to overcome this condition. Both athletic and gymnastic work is given, however, in order to produce variety and enthusiasm for exercise. Men qualifying for freshman football, cross-country, hockey, track, basketball, swimming, boxing, fencing, and wrestling teams are given credit in physical education, while these sports are in progress, after which they are transferred to the regular gymnasium classes. Arrangements for the exchange of this work must be made with the Director of the Gymnasium, otherwise no credit will be given.

Barbour Gymnasium, for women, contains, in addition to the gymnasium proper, offices of the Advisers of Women and the Director of the Gymnasium; a club room and parlors; and a hall (Sarah Caswell Angell Hall) accommodating 550 people, for lectures, meetings, theatrical entertainments, etc. The basement contains dressing rooms, shower baths, and a swimming tank which, with instruction in swimming, is open to all women registered in the University. The new field house for women on Palmer Field provides bowling alleys, indoor golf school, indoor archery range, rifle range, lockers, and showers.

The facilities of the Gymnasium, including physical examination and instruction, are free for all students, the only charge being a rental of $2 a year for a locker. For men, attendance twice a week is required of all first-year students in the Colleges of Engineering and Architecture, Literature, Science, and the Arts,
and Pharmacy, and in the School of Music*. Classes begin Monday of the third week of the first semester. Students electing Military Science are excused from the work in Physical Education. During the year six hygiene lectures are given in connection with the physical training practice. All freshmen including those electing Military Science are required to attend these lectures.

The Athletic Field, known as Ferry Field, comprising seventy-eight acres of land, has been set apart and equipped for outdoor sports of every kind. Several football fields and baseball diamonds, running tracks, soccer fields, indoor baseball diamonds, tennis courts, and space for numerous other games afford possibilities for complete programs of intramural and intercollegiate athletics. An 18-hole golf course is now under construction and will be ready for play in the spring of 1931. In addition to the playing field there are a new football stadium seating 82,000, a baseball stand accommodating 8,000, an Athletic Administration Building, an indoor playground known as Yost Field House, and the Intramural Sports Building.

The Yost Field House provides accommodations for all kinds of athletics during the winter months when they cannot be conducted out of doors. The building is 342 feet long by 165 feet wide. It contains ample locker and shower facilities and seats 8,000 spectators in the main activities room. The activities room, itself, is 286 feet long by 160 feet wide and contains an eighth-of-a-mile track, a 75-yard straight-away, a basketball court and provisions for indoor practice in football and baseball. There are also provisions for handball, indoor golf, and wrestling.

The new Intramural Sports Building, similar in design and construction to Yost Field House, contains almost every conceivable facility for indoor sport and recreation. It is not planned to provide facilities for spectators, but to utilize every foot of space for athletic activity. The new building forms the north side of a quadrangle which includes the Administration Building, concrete stand for track and field athletics, west tennis court unit, and Yost Field House.

The field house and the sports building give a complete athletic plant that functions the year around.

*This is the requirement for the present year, but steps are being taken to extend this requirement to two years. Notice is hereby given to prospective students that before next fall the present requirement may be changed.
THE ASSEMBLY AND MENTOR SYSTEM

27. Each engineering class has its separate assembly. The freshman class is brought together once a week, other classes about four times a year. Attendance at freshman assembly is required; unexcused absences subject the absentee to discipline. In freshman assemblies, faculty members and visiting engineers address the students, and the regular business of the class is assured of attention by the class as a whole.

Closely connected with these assemblies is the Mentor System. When Freshman Week ends, the Mentor System begins; the faculty Adviser continues with his group as Mentor for the group. Both socially and in an advisory capacity the mentor is the personal representative of the Dean, so that each student may feel free to call on his mentor at any time with reference to any subject relating to his college life.

The students receive reports on each of their studies through their mentors or faculty advisers. These reports reach the mentor about six weeks after the beginning of the semester, and about four weeks before the final examinations; he is therefore able to give the men in his group not merely general advice but definite information as to how they are getting along in their college work.

THE HONOR SYSTEM

28. The students of the College of Engineering have adopted the following system: All examinations and written quizzes in the College are held under the Honor System, the object of which is to create a standard of honor which is essential to a successful engineer and a good citizen. Students are expected to uphold the system or declare their objections to it, after having been duly instructed in all its rules. The instructor does not remain in the room during an examination. The students are placed upon their honor to refrain from all forms of cheating and to reprimand a fellow student who acts suspiciously, and in case he does not take heed, to report him to the Honor Committee. Every student must write and sign the following at the end of his examination paper, if he does not ask for an examination under a proctor:
ELECTION OF STUDIES

“I have neither received nor given aid during this examination.”

The Honor Committee consists of one student elected annually from each class in the College of Engineering, and one from the College of Architecture, each member to serve two years.

WOMEN STUDENTS

29. All undergraduate women of the University must make arrangements for their rooms, through the office of the Advisers of Women, from the list of approved houses. This ruling applies to the undergraduate women enrolled in the Colleges of Engineering and Architecture. Individual adjustments can sometimes be made by securing special permission from the office of the Advisers of Women.

Matters of scholarship and attendance are handled by Associate Dean Patterson for Engineering and Professor Lorch for Architecture. Assistant Secretary Green acts as educational mentor for the women in Engineering and Architecture.

RULES GOVERNING ELECTION OF STUDIES

30. (a) No student shall be permitted to elect less than 12 hours, and no student whose grade average for the preceding semester is less than 3 shall be permitted to elect more than 18 hours per semester (exclusive of Military Science), except by permission of the Hours Committee.

(b) No credit will be allowed to a student for work in any course unless the election of the work is formally entered on his office classification card.

(c) After classification no study can be taken up or dropped without special permission of the Committee on Classification. The time for dropping any course without record is limited to six weeks from the opening of the semester. A course may be dropped only with the permission of the classifier after conference with the instructor in the course. Only in special cases, and then only for good and valid reasons, will permission to drop a course be given after this time. Such permission is granted by the Associate Dean after conference with the classifier in charge of the group and the instructor in the course.

(d) All requests to the Faculty must be made out on a printed form furnished by the Secretary of the College.
(e) A student is required to drop a part of his work at any time if he appears to be undertaking too much; or to take additional work if he is thought not to be sufficiently employed.

(f) Only such students as are regularly enrolled in a class will be allowed to take quizzes, tests, or final examinations in the same.

(g) The Faculty reserves the right to withdraw the offer of any elective study not chosen by at least six persons.

(h) After matriculation, a student cannot, without special permission of the Faculty, be admitted to examination in any one of the courses given until he has received in the University the regular instruction in such course.

**EXCUSES FOR ABSENCES**

31. Underclassmen in the College of Engineering must take the initiative in securing from the Associate Dean excuses for absences from classes, which excuses must be applied for within five days after their return to classes. Upperclassmen* should explain irregularities of attendance to their instructors. Students in the College of Architecture should obtain excuses from Professor Lorch.

Unexcused absences from Assembly during the freshman year are considered by the Discipline Committee as acts of insubordination. After two absences unexcused by the Head Freshman Mentor, the student is warned by the Discipline Committee. After two more unexcused absences, the Discipline Committee places the student upon probation for insubordination, the probationary period to last for the remainder of the freshman year. Two more unexcused absences will subject the student to the penalty of suspension in the usual manner for the remainder of the school year.

**UPPERCLASSMEN**

32. The Faculty recognizes as upperclassmen: a, those students in good standing, i.e., not on probation, who have obtained at least 65 hours of credit, with an average grade of at least C for all work taken at the University of Michigan; b, all new students who have completed a four-year course at approved colleges and other like institutions; and c, other new students with

*For the definition of upperclassmen see section 32.
good previous record who in the opinion of the department heads may qualify for graduation within one year.

An upperclassman's privilege will be withdrawn should his average grade for all work at the University fall below C or should he be put on probation, and will be restored when his delinquency is removed.

Upperclassmen are not required to obtain excuses for irregularities of attendance from the Associate Dean, but should explain them to their instructors.

**EXAMINATIONS AND ENTRANCE DEFICIENCIES**

33. Examinations for admission are held before the beginning of each semester. See section 13.

An applicant who fails, or is deficient, in some part of the admission requirements may, at the discretion of the Faculty, be admitted, provided he passes in fifteen units; but the removal of entrance deficiencies shall take precedence of all other work; any deficiency must be removed at one of the next two regular examinations for admission, but the Classification Committee is empowered and instructed to see that students entering this College with deficiency remove the same as far as possible during the first semester of residence.

No student who has an admission deficiency outstanding at the beginning of his second year of residence will be allowed to enter his classes until such deficiency is removed, unless for valid reason an extension of time is granted for its removal.

Examinations in college work are held at the end of each semester, but classes are liable to be examined at any time, without notice, or with one week's notice, on any portion of their work. The regular examination in any course at the end of each semester is an essential part of the work of the course.

**MARKING SYSTEM**

34. At the end of each semester the quality of the work of every student in each course which he elects and completes is reported by the instructor as A (excellent), B (good), C (satisfactory), D (passed), or E (not passed).
When a student is prevented by illness or by any other cause beyond his control from taking an examination or from completing any other part of a course, or if credit in a course is temporarily withheld for any reason, the mark I may be placed before the grade to indicate that the course has not been completed. An incomplete course is thus reported IA, IB, IC, ID, or IE. The grade indicates the quality of work done in the part of the course which has been completed.

Any student absent from an examination is required to report to his instructor as soon thereafter as possible. If a student presents a valid excuse for his absence, he may take the examination at such time as may be arranged by the instructor. If such excuse is deemed unsatisfactory, the record shall be reported E. In order that credit for a course may be given it must be completed before the end of the eighth week of the semester of residence next succeeding that in which it was elected.

The final grade in a course which has been completed during the semester of residence following that in which it was elected will be based upon all of the work done in the course. It will not necessarily be the grade reported for the partially completed course.

At the time of completing a course students must obtain from the Secretary a blank form for presentation to the instructor. The blank when filled out must be deposited by the student with the Secretary within one week of the date entered upon it by the instructor. The same procedure is followed when an entrance condition has been removed.

**RULES GOVERNING GRADES AND SCHOLARSHIP**

35. (a) The average semester grade and the general average grade is computed for each student at the end of each semester and becomes part of his permanent record.

(b) The average grade is determined on the basis of A equals 4, B equals 3, C equals 2, D equals 1, and E equals 0.

(c) The average grade is computed by multiplying the number corresponding to the grade in each course by the hours of credit for the course and dividing the sum of these products by the total number of hours represented by all the courses considered. A supplementary grade removing an incomplete shall be used in computing averages when that grade is different from the
original semester grade qualifying the report of incomplete. It is permissible for a student to repeat a subject in order to raise his grade average.

(d) No student whose general average grade is below 2.0 may be graduated.

(e) When the average semester grade of a student falls below 1.6 he is automatically placed on probation.

(f) Students on probation must elect at least 12 hours' work a semester or 6 hours a summer session.

(g) Students on probation who obtain an average semester or summer session grade of 2.0 or more are automatically removed from probation.

(h) A student will be placed on the home list for any one of the following reasons:
   1. If his average semester grade falls below 1.0.
   2. If he is on probation and fails to obtain an average semester grade of 2.0.
   3. If he has been on probation during any two semesters and subsequently fails to obtain an average semester grade of 1.6.

(i) In cases of extenuating circumstances, at the discretion of the Committee on Delinquent Students, students placed on probation may be removed from probation, and students placed on the home list may be continued on probation.

(j) Students having a general grade of less than 3.0 may not elect extra hours; students having an average of 3.0 or more may elect extra hours, the number of extra hours which such students may elect to be determined by the classifier.

REGENTS' RULE GOVERNING OPERATION OF MOTOR VEHICLES BY STUDENTS

36. "No student in attendance at the University from and after the beginning of the first semester of the University year 1927-1928 shall operate any motor vehicle. In exceptional and extraordinary cases in the discretion of the Dean of Students this rule may be relaxed."

WITHDRAWAL FROM THE COLLEGES

37. A student should not withdraw from class even temporarily without obtaining permission.

Leave of absence will be granted to those who expect to return before the end of the year.
Honorable dismissal will be granted to those who wish to transfer to another College of the University and to those going elsewhere, provided in either case they are in good standing.

Engineering students must obtain this permission or dismissal from the Associate Dean, and architectural students from the Professor of Architecture.
38. The broad subject of engineering has been defined as "the art and science of directing the great sources of power in nature to the use and convenience of man." It includes the discovery, conservation, and utilization of the resources of the earth, the waters, and the air. Discovery includes not only the exploration of mineral, timber, and other visible resources of the world, but also the experimental investigations of the laws controlling important phenomena and processes. Conservation includes the prevention of waste of all sorts, whether of natural resources or in manufacturing processes. Utilization includes the generation and transmission as well as the actual application of heat, light, and electricity by mechanical, electrical, and chemical means to serve useful purposes; the design and erection of structures and machines of all types, and the efficient operation of all processes, involving preparation, manufacture, transportation, or utilization of materials on a large scale. In the newer conception of engineering efficient operation must consider not only the physical property but also the relation of the industry to the outside world, including its duty to stockholders, employees, clients, and the community in which it is situated.

Until a century ago engineering was divided into two branches, military and civil engineering. Since then civil engineering has developed in so many directions and to such an extent that new designations have come into use for its various branches.

The name "civil engineering" has been retained at the University of Michigan to designate the courses given by its Department of Civil Engineering.

The other Departments, some of which are outgrowths of civil engineering and others of different origin, are Engineering Me-
chanics, Geodesy and Surveying, Mechanical Engineering, Electrical Engineering, Marine Engineering and Naval Architecture, Chemical Engineering, and Aeronautical Engineering, all degree-conferring departments.

The Departments of Astronomy, Mathematics, and Physics, which serve the whole University, co-operate with the College of Engineering in its programs leading to the degree of B.S. in Engineering with specialization in Astronomy, Mathematics, or Physics.

In addition to the degree-conferring departments, the College of Engineering has departments of instruction in Mechanism and Engineering Drawing and in Shop Practice; and it uses, with the rest of the University, the Departments of English, Modern Languages, Chemistry, Military Science, etc., which give special courses for engineering students. Engineering students are allowed wide liberty to elect courses in history, philosophy, economics, and other cultural subjects without additional cost.

Beside the departments of instruction, the College of Engineering includes the Department of Engineering Research which was established by an act of the Regents in October, 1920. The purpose of this act was to establish a point of contact between the University and the technical and industrial interests in the State in the field of research. This Department, because of the extensive laboratory and library facilities available at the University, in addition to its ability to call upon members of the teaching staff to direct and supervise research, is in a position to undertake and investigate a large number of problems of varied character.

Full descriptions of the various departments, their scope, facilities for instruction, and the courses offered, will be found elsewhere in this bulletin.

BUILDINGS AND OTHER EQUIPMENT

39. The work of the College of Engineering is carried on in several buildings belonging to the College, viz., the West Engineering and the East Engineering Buildings, the West Engineering Annex (the old Engineering Shops), the R. O. T. C. Headquarters (the old Power House), East Hall. The College also shares with the rest of the University in the use of the Library, the East
and the West Physics Buildings, the Chemistry Building, the Astronomical Observatory, the Gymnasium, etc. The summer work in surveying is carried on at Camp Davis. See section 78.

The West Engineering Building built about twenty-five years ago to house most of the work of the Colleges of Engineering and Architecture is now used by the College of Engineering for the Departments of Civil, Mechanical, Electrical, Marine and Aeronautical Engineering, Geodesy and Surveying, Mechanism and Engineering Drawing, Engineering Mechanics, and Mathematics.

The East Engineering Building, completed in 1923, with a gross floor area of 160,000 square feet, contains laboratories, classrooms, shops, drawing rooms, libraries, and offices, and houses the Chemical Engineering Department, the Engineering Shops, the Department of Engineering Research, the Division of Transportation Engineering, the State Highway Laboratories, and the Department of Aeronautical Engineering.

The West Engineering Annex provides additional space for Mechanical Engineering (automobile engineering), Engineering Mechanics, and Geodesy and Surveying; the R. O. T. C. Headquarters houses the Department of Military Science; and East Hall is used for offices and classrooms.

A new building has recently been completed for the College of Architecture.

For the equipment of these buildings and Camp Davis, see later articles concerning the various departments of instruction.

The College recognizes that the benefits of instruction are far more dependent on the character of the instructors than upon any adjunct in the way of laboratory apparatus or of physical illustration, and with this in view the instructing staff has been selected from among those qualified both by technical training and practical experience; in addition extensive use is made of the ordinary supplementary aids.

40. The Libraries.—A large modern library building, erected at a cost of $615,000, was opened in January, 1920. This building has general and special reading rooms for one thousand students at one time, and is equipped with modern appliances for the housing and serving of books. The University Libraries receive over 4,500 periodicals annually.
The University Libraries contain at present about 681,000 volumes, of which many are of importance to engineers and architects.

The **West Engineering Library**, comprising over 17,600 volumes, is housed in the West Engineering Building. The latest and best books on professional subjects are added yearly to the library, where they are accessible to all, and frequent references are made to them in the classroom as the various subjects are brought forward. Over one-half of the collection consists of files of professional periodicals and proceedings of engineering societies.

The **East Engineering Library**, opened in 1924, is housed on the third floor of the East Engineering Building. It is provided with 15,000 books, and 125 periodicals of particular interest to students in Chemical Engineering, Engineering Shops, and Aeronautics. A special collection of books is available to those students pursuing courses in English.

**Transportation Library.**—The Transportation Library contains 75,000 books and pamphlets dealing with every phase of transportation. It is housed in the East Engineering Building. In this library are many rare books and pamphlets relating to the origin, history, and development of our various transportation systems. It also contains very complete files of the various technical engineering associations; the modern and current periodicals dealing with railways, highways, waterways, and other engineering subjects; state and national, public utility, highway, and special commission reports; annual reports of railways and other transportation companies; proceedings of various transportation associations; and the latest books on the technical and economic phases of transportation. All of these pamphlets, books, and periodicals are grouped in alcoves pertaining to particular subjects. Adjacent to each alcove are tables convenient for the use of students and others engaged in transportation research.

**The Architecture Library** in the new building for the College of Architecture contains a collection of books of value to Architectural students. For additional information see Section 112.

**The English Library**, in East Hall, contains a collection of reference books for the use of students in English courses.

**The William L. Clements Library** of American History, completed in 1923, the gift of Hon. William L. Clements, B.S., 1882, houses the invaluable collection gathered by him and given to the University. The collection of books, manuscripts, and maps relating to the discovery of the western continent, its settlement,
and later history, is especially rich in rare books, pamphlets, and manuscripts dealing with our early colonial history and the period of the American Revolution.

41. University Power Plant.—The University Power Plant is a fine example of modern power plant construction and is used for purposes of instruction as well as to furnish heat, power, and light to the university buildings. The boiler room equipment consists of eleven boilers totaling 7000 rated horsepower with all necessary auxiliaries and a complete coal and ash handling system. Coal is brought directly from the Michigan Central Railroad to the plant over an electrically-operated road. The generating equipment has a total capacity of 2000 kva. in engine and turbo-alternator units. Tunnels are provided for the underground distribution of steam, hot water, and electrical energy. There is available alternating current at 2,300 volts, 200 volts for lighting, and other voltages for power; also direct current at 220 volts and 500 volts; high- and low-pressure steam; and hot water.

42. Visits of Inspection.—The University is well situated for excursions to engineering industries. In Ann Arbor there is a large modern telephone exchange. The Detroit Edison Company has four hydro-electric power stations, one at Ann Arbor and the others within a distance of four miles. These stations are of recent construction and illustrate the very latest engineering practice in hydraulic and electrical design.

At Detroit there is much of interest to students of electrical engineering, including the main power houses and substations of the Detroit Edison Company, and of the Detroit Street Railway, the electrically-operated Michigan Central Railroad tunnel under the Detroit River, and the new railroad terminal.

The classes in Hydraulics have been given the opportunity to assist in the tests of new power plants, and recently forty seniors spent four days on the tests of one of the largest plants in the State. The managements of the companies operating these plants are all in hearty sympathy and accord with the College of Engineering and afford the students every opportunity for inspection of the plants.

There are within forty miles two of the most complete modern classification yards in the United States, illustrating all types of humps and other modern sorting, the New York Central freight terminals at Toledo and the Michigan Central passenger terminals at Detroit. The Detroit River tunnel and the street railway properties in both cities afford exceptional opportunities for the inspection of important work. The co-operation of railways with the work of the department extends not only to giving students access to the properties but to giving freely to the University plans of
all standard and special structures, for illustrative material, as well as courses of lectures by officers of the companies.

From the standpoint of automobile engineering, the University of Michigan has a strategic location at the very center of the automobile industry of the country. Detroit, Toledo, Flint, Jackson, Lansing, and Indianapolis, with the greatest automobile factories in the world, are within easy excursion distances and each year an inspection trip is made under the direction of the Automobile Department. These trips, while primarily for Engineering students, are open to any who are interested.

The classes in Chemical Engineering visit each year about forty industrial plants illustrating the transition of raw materials to finished products. The list includes large and modern plants illustrating the manufacture and treatment of iron and steel, copper, brass, and aluminum; Portland cement, clay products, and glass, salts, acids and alkalies, electrolytic and electric furnace products; gas, ammonia, tar, and other products from the destructive distillation of coal; petroleum; the vegetable fats and oils, including paint, varnish, and soap; sugar; food products, leather, and paper.

The students in Marine and Aeronautical Engineering have opportunities of visiting both Detroit and Toledo where various shipyards and aircraft factories are situated. The airports at the same places also afford an opportunity of inspecting the various types of aircraft and port equipment both for water and air transportation.

SOCIETIES

43. The Engineering Society.—The Engineering Society of the University of Michigan is an organization of students formed by the affiliation of sections from each department of the College of Engineering. Membership in the sections is voluntary and is regulated by the constitution of each section. Such membership entitles the students to all the privileges of the general society.

In the several sections of the society original papers are presented and the members are encouraged to take active part in the discussions, thus fitting themselves for a broader field of endeavor when they enter into the actual practice of their chosen profession. Helpful criticisms and suggestions are given by faculty members and the student is aided in every way in acquiring the art of public speaking.

The general society has as its primary purpose the creating of a broader field of vision for the engineering student. This it attempts to accomplish by providing the opportunity for closer associations and the promotion of a social spirit among the students of the several departments; by securing as speakers at its meetings engineers of prominence in all fields of the profession; and by the publication of articles of general information to the
student. As a further means to this end the society publishes quarterly a journal, called *The Michigan Technic*, which contains papers read before the society, abstracts of these, contributed articles from the alumni and faculty members, and other matters of interest to the student and the profession. A reading room is also maintained by the society where all the leading magazines and technical papers are accessible.

The sections of the general society are as follows:

**Student Branch, American Society of Civil Engineers.**—This Chapter was founded in 1923, and differs from other student chapters in that its membership is limited in numbers and is confined to senior and junior students whose scholarship is above the college average.

**Mechanical Engineering Section.**—This section of the general society is also a student branch of the American Society of Mechanical Engineers. Meetings of the section are held about once a month. Some of the meetings are of a purely social nature while others are addressed by members of the faculty or by outside engineers and business men on subjects of general interest to the profession.

**Electrical Engineering Section.**—This section is a student branch of the American Institute of Electrical Engineers. In joining it, the student makes a connection which usually extends throughout his whole professional life after graduation, and which helps him materially by furnishing opportunities for advancement. The meetings, which are held twice each month, are managed entirely by the students, who procure speakers from among themselves or from professionals in the field, and who derive valuable experience in self-expression as well as technical knowledge from the discussions which they must make for themselves. Each member of the branch receives, in addition to the monthly *Michigan Technic*, a copy of the Proceedings of the A. I. E. E., which are issued once each month.

**Chemical Engineering Section.**—This section is a student branch of the American Institute of Chemical Engineers. The student branch holds meetings where subjects of professional interest are discussed. It has been assigned a clubroom in the East Engineering Building.

**The Transportation Club** is an organization formed by students with a mutual interest in the general subject of transportation. It forms a common meeting ground for students of railroads, highway engineering and transport, aeronautics, marine engineering, business administration, and economics. Because of
its universal nature, it has developed a general appeal to the student body, and the monthly meetings are addressed by prominent engineers.

**Tau Beta Pi**, the national engineering honor society, has a chapter in the College of Engineering. For membership in this society good scholarship is essential.

**The National Society of the Sigma Xi** has a chapter in the University. The aim of the society is to encourage research. High scholarship and the promise of ability in research are required of its candidates.

**Phi Eta Sigma**, a national honorary society for freshman men, elects members each year on the basis of high scholarship.

**Phi Kappa Phi**, a national scholastic honor society, elects its members each year from the senior classes of all Schools and Colleges on the basis of scholarship, personality, and service to the University.

**FELLOWSHIPS**

44. **American Gas Association Fellowships in Metallurgy.**—In 1928, two fellowships were established for the study of the utilization of gas in heat-treating steel.

**American Petroleum Institute Fellowship.**—This fellowship is maintained for the purpose of studying the physical properties of petroleum and petroleum products. The sum of $2,500 is annually available for payment of the fellowship and for special equipment.

**Thomas Berry Memorial Fellowship in Chemical Engineering.**—Established in 1927, for the study of varnishes and other protective coatings. The holder of this fellowship receives $750 a year.

**Roy D. Chapin Fellowship in Highway Engineering.**—This fellowship is offered to provide for the investigation of an approved subject relative to hard-surfaced roads and pavements. It pays the sum of $250, with an allowance of $50 for expenses.

**Roy D. Chapin Fellowship in Highway Transport.**—This fellowship is offered to provide for the investigation of an approved subject relative to highway transport. It pays the sum of $250, with an allowance of $50 for expenses.

**Detroit Edison Company Fellowship in Chemical Engineering.**—The Detroit Edison Company has maintained, since 1924, a
fellowship for the study of the fundamental phenomena connected
with the deposition of boiler scale. The holder of this fellowship
receives $750 a year.

Detroit Edison Company Fellowships in Highway Engineering.—Two fellowships are offered for the investigation of
approved subjects relative to moderate-cost country roads. Each
fellowship pays the sum of $250, with an allowance of $50 for ex-
penses.

Detroit Edison Company Fellowship in Metallurgy.—One
thousand dollars is available annually. Of this amount $750 is
paid to the appointee, the remainder being applied to expenses inci-
dent to the research or researches undertaken. The fellowship is
for study of problems in metallurgy relating to power plant con-
struction and operation of the utilization of power.

Detroit Steel Products Company Fellowship in Ventilation.—
This fellowship is for the year 1929-1930.

Lawton Fellowship in Astronomy and Mathematics.—The
stipend varies from two to four hundred dollars. Preference is
given to Astronomy if there be a suitable candidate.

Michigan Gas Association Fellowship.—This fellowship has
been maintained continuously since 1900 with the exception of
interruptions during the war. The holder of the fellowship re-
ceives $750.

The Natural Gasoline Association of America Fellowships,
four in number, are for the study of the properties and use of
natural gasoline in internal combustion engines. Holders of these
fellowships receive from $750 to $1,000.

Ordnance Fellowship.—A fellowship known as the Ordi-
inance Fellowship was established in the fall of 1925, the funds
being supplied from the United States Government Ordnance Re-
search Fund which is at the disposal of the University. The fel-
lowship carries a stipend of $750.

Ray Sand and Gravel Company Fellowship in Highway
Engineering.—This fellowship is offered to provide for the in-
vestigation of advisable methods of sampling and testing sand and
gravel for construction purposes. It pays the sum of $250, with
an allowance of $50 for expenses.

Reo Motor Car Company Fellowship in Highway Trans-
port.—This fellowship is offered to provide for the investigation
of the economical utilization and operation of motor busses. It
pays the sum of $250, with an allowance of $50 for expenses.
Swenson Evaporator Company Fellowship.—In 1928, the Swenson Evaporator Company again supported a fellowship for research in the field of Chemical Engineering. The stipend was $750.

Timken Roller Bearing Fellowship in Physics.—This fellowship for the year 1929-1930 has a stipend of $800.

SCHOLARSHIPS AND PRIZES

45. American Bureau of Shipping Prize.—A prize of $100 is offered each year by the American Bureau of Shipping, to the student in Naval Architecture and Marine Engineering who obtains the highest average for the last two years of the curriculum, in the regularly prescribed courses.

Cornelius Donovan Scholarships.—These scholarships were established in 1922 by bequest of Cornelius Donovan of the class of 1872. At present about $3,500 yearly is available for award to meritorious junior and senior students in engineering who are working their way through college.

Robert Campbell Gemmell Memorial Scholarship.—This scholarship in memory of her brother, Robert Campbell Gemmell, B.S.(C.E.), '84, C.E., '95, M.Eng. (hon.), 1913, was founded by Mrs. Lillian Gemmell Boal (Mrs. S. H. Boal) of Oakland, California, by a gift of $10,000 to the University.

"This scholarship is to be available for freshman and sophomore students in the College of Engineering . . . . of general worthiness and deserving character." The income may be divided among several beneficiaries if the committee in charge so determines.

Frank Sheehan Scholarship in Aeronautics.—This scholarship, provided by the interest on a gift of twenty thousand dollars, will be available for the year 1930-1931.

LOAN FUNDS

46. The following loan funds have been established especially for the use of engineering students who are in need of aid to complete their studies: George H. Benzenberg Loan Fund; Class of 1915 Engineering Loan Fund; William J. Olcott Scholarship Loan Fund; Class of 1914 Engineering Loan Fund (for seniors, no interest before note matures); Class of 1917 Engineering Loan Fund and the John Frank Dodge Loan Fund (for juniors and seniors); Marian Sarah Parker Memorial Fund (for females); J. B. and Mary H. Davis Trust Fund (Geodesy and Surveying); and Minnie Hubbard Smith Revolving Fund (juniors and seniors in Civil En-
gineering.) These special loan funds, together with a number of all-University funds which are open to students in engineering and architecture, are described in the bulletin, Scholarships, Prizes, and Loan Funds, which is available on request.

Applications for the Minnie Hubbard Smith Revolving Fund should be made to the Head of the Department of Civil Engineering. Applications for loans from all other funds should be made to the Dean of Students, Room 2, University Hall.

BEQUESTS AND GIFTS

47. The University of Michigan has in recent years become more and more frequently the object of bequests and donations from public-spirited alumni and citizens of Michigan and other states who see in the state university a means of serving the present and the future. From one-quarter to one-third of the University's permanent assets, in funds, lands, buildings, and equipment have been contributed by such friends. Any correspondence on this subject may be addressed to the President of the University and all inquiries will receive prompt and candid replies.

For the benefit of those who may desire to make use of the same, a correct form of bequest is here given with the corporate title of the University:—

“*I give, devise, and bequeath to the Regents of the University of Michigan........(here insert the sum or the property bequeathed)...........for the following purposes...........(here insert the purpose of the bequest)...........*”

In the light of experience, even in so young a country as the United States of America, it is apparent that no one can unmistakably read the future. This fact has resulted in reducing almost to uselessness certain bequests made in earlier days to various institutions. With the idea of permitting most useful continuance of the benefaction in general accord with the purposes of the donor even if with the changes of the years the precise purpose of the gift should prove to be no longer a real need, it is suggested that all benefactions might wisely contain a clause similar in purpose to the following, which is quoted direct from an actual will:—

“The event that the sums available hereunder for the purposes stated shall in the opinion of the said Regents at any time exceed the need therefor, then such excess income may be used by the Regents for the advancement of research and for educational purposes generally and for the needs of the University in such amount and in such manner as they may from time to time deem best.”
DEGREES CONFERRED IN THE COLLEGE OF ENGINEERING

48. The University of Michigan confers on all graduates of the College of Engineering the Degree of Bachelor of Science in Engineering, the diploma designating the branch of engineering which the student has pursued.

DEGREES CONFERRED IN THE GRADUATE SCHOOL

49. Graduate courses are offered in the Graduate School leading to the Degrees of Master of Science in Engineering, Doctor of Philosophy, Doctor of Science, Civil Engineer, Mechanical Engineer, Electrical Engineer, Chemical Engineer, Naval Architect, Marine Engineer, Aeronautical Engineer, and Geodetic Engineer.

All students who have received a bachelor's degree from the College of Engineering of this University or from some other university or technical school of recognized standing may enroll in the Graduate School for the degree of Master of Science in Engineering and for other higher degrees. See the Announcement of the Graduate School, which may be had on application.

Students enrolled in the Graduate School must have a subject of specialization but studies may not be selected exclusively in the single department concerned with the subject. Cognate subjects should be selected in other departments. While it is expected that at least half of the work will be in a single department and also that the work will have unity, narrow specialization is discouraged. After a student has selected his department of specialization he should confer with the professors under whom he expects to study and with them arrange the details of his course.

REQUIREMENTS FOR GRADUATION

50. To secure a degree in the College of Engineering, a student must meet the following requirements:

(a) He must complete the required courses of his department.

(b) He must complete a sufficient number of group options or other courses of University grade approved by the head of his department to make a total of 140 credit hours with an average grade of 2 or above. See section 35.

A credit hour represents as a rule one hour of recitation, preparation for which should require two hours of study; or in the case of laboratory work, the credit hours are one-half to one-
third of the actual hours, the time required depending on the necessary home work.

A student may not, in general, offer as group options advanced credits earned in the preparatory school.

MODERN LANGUAGES AND CULTURAL ELECTIVES

51. All regular students in the College of Engineering are required to complete the equivalent of Course 32 in French, German, or Spanish, as given in the University, or Course 31 in Spanish if preceded by two years of Latin in the high school. Course 2 in Spanish if preceded by at least three units of Latin or Greek, will satisfy this modern language requirement.

Students in the College of Architecture are required to complete Course 31 in French or German.

Students whose language is other than English may substitute English for French, German, or Spanish, the maximum amount of English being seventeen hours.

Students in aeronautical engineering are advised to elect French; in chemical engineering, German; and students in astronomy, mathematics, and physics are advised to elect both French and German.

After completing the foreign language requirement, students must elect courses from the following list, until they have sixteen hours of college credit in foreign languages and other cultural studies: Economics, English, Fine Arts, Foreign Language, History, Mathematics (Advanced), Military Science and Tactics (not to exceed 4 hours), Music, Philosophy, Political Science, Psychology, Sociology, and Speech.

Plane Trigonometry and Chemistry 3 will be included in this list when college credit is given in these studies. Advanced courses in Mathematics may be counted as cultural or technical electives, at the discretion of the head of the technical department concerned.

To secure credit in Music, courses must be chosen from those scheduled in the College of Literature, Science, and the Arts.
Part IV

COLLEGE OF ENGINEERING

NON-PROFESSIONAL DEPARTMENTS

STUDIES OF THE FIRST YEAR

52. There is a common first year for all students entering without deficiencies or advanced credits. After the first year, each student indicates the branch of engineering he expects to follow and is then registered as a student in that branch.

In the second year there is some variation among the curricula for the different branches of engineering, though not so great as to make transfers difficult; but in the third and fourth years there are marked differences and a student transferring from one course to another does so with difficulty and with some loss of time.

The schedule of studies for first-year students is as follows:

<table>
<thead>
<tr>
<th>First Semester</th>
<th>Second Semester</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Courses</strong></td>
<td><strong>Courses</strong></td>
</tr>
<tr>
<td><em>Modern Language</em></td>
<td><em>Modern Language</em></td>
</tr>
<tr>
<td>Chem. 5E or Shop 2 and Engl. 1 and 2</td>
<td>Chem. 5E or Shop 2 and Engl. 1 and 2</td>
</tr>
<tr>
<td>Drawing 1</td>
<td>Drawing 2</td>
</tr>
<tr>
<td>Assembly</td>
<td>Assembly</td>
</tr>
<tr>
<td>Physical Training or Military Science 0 or 1</td>
<td>Physical Training or Military Science 0 or 1</td>
</tr>
<tr>
<td>16, 17, or 18</td>
<td>16, 17, or 18</td>
</tr>
</tbody>
</table>

Physical training twice a week throughout the year (without credit in hours) is required of all first-year students, unless Military Science (one hour credit each semester) is elected as a substitute. Enrollment in Military Science is for a period of four semesters.

*See section 51 for Modern Language requirement.
Schedules of studies for later years will be found under the work of the various degree-conferring departments.

The above schedule assumes that the student has presented for admission the full requirement in algebra and geometry, and also trigonometry and chemistry of the alternative requirements described in section 10. Should the student have entered without trigonometry or chemistry, or both, the schedule will be modified by adding trigonometry and (or) Chemistry 3 followed by Chemistry 6 (in place of Chemistry 5).

In case that the admission requirements have been fully met on entrance, trigonometry and Chemistry 3 will give credit toward graduation as cultural subjects. See section 51. Should the student have entrance deficiencies in advanced algebra, solid geometry, trigonometry, physics or chemistry, the deficiencies must be removed but without credit toward graduation.

A deficiency in foreign language introduces no irregularity in the schedule. See section 51.

The classifier in consultation with the student will arrange a schedule intended to adjust the irregularities as quickly as possible. Students are required to remove all deficiencies during this first year, unless granted an extension of time for their removal. See section 33.

NON-PROFESSIONAL DEPARTMENTS

53. In the following sections are listed courses given entirely, or primarily, for students in engineering or architecture, and in addition those courses which frequently are elected by them. For other courses see the Announcements of the College of Literature, Science, and the Arts, the School of Business Administration, and others.

A course in another college, listed in any engineering curriculum, may be elected by our students without special formality; but the approval of the deans, readily obtained, may be required when the course is not intended for engineers. Lack of proper preparation for the course is sufficient reason for approval to be refused.

Besides the departments listed below, in which our students make frequent elections, there are many others which freely and hospitably receive our students. The Colleges of Engineering and Architecture in the same way receive students from other colleges.

54. BACTERIOLOGY AND WATER ANALYSIS

Associate Professor Hadley and Assistant Professor Emerson.

3E. Practical Bacteriology. This course is open only to students of Sanitary Engineering. Three afternoons each week during the second half of the first semester, beginning about November 20. Room 2552, East Medical Building. Two hours credit.
5E. **Water Analysis.** Three afternoons weekly, M, W, F, during the first half of the first semester. This course is open to students of Sanitary Engineering and to others who are qualified. Room 1552, East Medical Building. Two hours credit.

55. **BUSINESS ADMINISTRATION**

*Professors Griffin, Rodkey, and Jamison; Associate Professors Blackett and Elliott; Assistant Professors Wolaer, Taggart, Phelps, and Waterman; Dr. Timoshenko, Mr. Bradbury, and others.*

The courses listed below are those which are deemed of special interest to engineering students. For the full list of courses in Business Administration, see the Announcement of the School.

95. **Personal Budgeting, Savings, and Investments.** The general purpose of this course is to provide a foundation for the intelligent management of one's private financial affairs. The work is divided into two main parts: the analysis of bonds and stocks and the development of a sound investment program; personal budgets and savings. Open to all students with fourth-year standing in the University. Not open for credit to students in the School of Business Administration. Three hours credit. First semester.

101. **Principles of Organization and Production.** This course consists of three parts. Part 1 begins with a survey of the historical and descriptive background of modern business and proceeds to some fundamental considerations relative to the individual enterprise, such as the factors influencing its size and location, and the major functional divisions found in a typical business unit. Part 2 is devoted to a study of production as a function in different types of industrial and commercial activity. In part 3, principles of managerial organization are studied, and attention is directed to the problems involved in co-ordinating the various activities of the business through such means as accounting and statistical records and reports. Three hours credit. First semester.

102. **Principles of Personnel.** This course deals with the problems of human relations in business and industry. Reasons for the present emphasis on personnel relations are first considered. The course, however, is chiefly concerned with methods of selection, training, and maintenance of personnel in business and industrial organizations. Devices used in selection and training are appraised. Systems of wage payment and methods for keeping a continuous inventory of employees are analyzed. As far as possible the "case method" is used. Three hours credit. Second semester.
113. Cost Accounting I. This is an intensive course in cost accounting in the manufacturing field. Particular attention is given to the methods of allocating indirect expense to departments, processes, jobs, and classes of product. Among the special topics considered are the relation of cost reports to selling policies, the control and valuation of inventories, and the determination of the cost of idle time. The principles of costing are illustrated in a complete cost set which the student is required to work out as a laboratory exercise. In addition, numerous shorter problems are assigned. Prerequisites: Economics 171 and 172. Three hours credit. First semester.

121. Elements of Statistics. This course will consider the calculation and use of averages, measures of dispersion, correlation and regression coefficients, and index numbers. Special attention will be given to the application of time series analysis to practical business problems. Three hours credit. First semester.

151. Marketing Principles I. This course, together with Course 152, deals with the transferring of goods and the ownership of goods from producer to consumer, with emphasis upon the business problems involved in these activities. Course 151 includes a consideration of the following subjects: (1) general principles of marketing; (2) the marketing of agricultural products including grading, the use of central markets, speculation, and the organized exchanges; (3) manufacturers' buying problems; (4) manufacturers' selling problems such as the choice of channels of distribution and of methods of sale, and the use of advertising. The course is conducted by the study of concrete business problems and supplementary readings. Three hours credit. First semester.

152. Marketing Principles II. This course is a continuation of Course 151 and has the same general aims. It specifically considers the following subjects: (1) price policies; (2) policies related to credit and finance; (3) standardization of products; (4) wholesalers' activities; (5) storage and the physical distribution of products; (6) retailing; (7) the State and marketing, including a discussion of "unfair competition." The method of instruction is the same as that in Course 151. Prerequisite: Business Administration 151 or its equivalent. Three hours credit. Second semester.

161. Financial Principles I. This course undertakes an analysis of the financial principles underlying the organization and management of business enterprises. Attention is given to the means of securing permanent capital both in the initial stages of a business and in the expansion of a going concern. The various methods of obtaining working capital are studied with special
emphasis upon the distinction between temporary and permanent borrowing. Consideration is also given to the policies to be followed with respect to the earnings of a business, and to various other problems of internal finance connected with the purchase, production, and sale of goods. Prerequisites: Economics 171 and 172. Three hours credit. First semester.

162. Financial Principles II. This course is a study of the organization and financial administration of modern business corporations. The corporation is compared with other forms of business enterprise. The course deals with such subjects as corporate promotion, the nature and varieties of stocks and bonds, capitalization, the methods of corporate expansion, the sale of securities, the principles governing the administration of income, intercorporate relations, and the problems and procedure of reorganization. Prerequisite: Business Administration 161. Three hours credit. Second semester.

202. Business Forecasting. This course endeavors to acquaint the student with the nature and limitations of business forecasting. The methods followed by the leading forecasting services in the prediction of general business conditions are studied, the actual basis of prediction analyzed, and the records of these services examined to determine the measure of success thus far attained. Students are expected to follow closely the current issues of at least one service. The practicability of forecasting for individual trades and industries is considered. Familiarity with the technique of statistical analysis is presupposed. Three hours credit. Second semester.

205. Business Law I. It is the purpose of this course to give a general survey of the fundamental principles of the law governing business transactions. The course will consider the main principles of contract; offer; acceptance, consideration, capacity of the parties; legality of object; the formal requisites of agreements under the statute of frauds; the operation of contracts in business, and their interpretation by the courts; breach of contract and damage. The law of business organization, and the nature and formation of relations in agency, partnership, and corporations will also be considered. Although this course is designed for second-year students, by special permission it may be elected by first-year students in the School. Three hours credit. First semester.

206. Business Law II. This course is devoted to specialized problems in credit; modes of safeguarding credit; negotiable instruments; guaranty and suretyship; mortgages; pledges; sales and conditional sales; problems in bankruptcy and insolvency, and receiverships. Students will be given topics for reports and dis-
This course should be of special interest to students specializing in accounting, finance, and banking. Three hours credit. Second semester.

281. Public Utility Management I. This course begins a consideration of problems of public utility management with attention chiefly directed to the problems of gas and electric utilities. In the first part of the course a thorough study will be made of public utility accounting methods, beginning with a study of the Interstate Commerce Commission classification of accounts for American Railways, and concluding with an examination of gas and electric utility classifications. The latter part of the course will deal with public utility finance and inter-company relationships. Three hours credit. First semester.

282. Public Utility Management II. This course will deal with problems of public utility management with a view to determining sound policy in cases of valuation, rate making, combinations, etc. As in Course 281, the emphasis will be upon the problems of gas and electric utilities. This course is a continuation of Course 281, by which it should be preceded. Three hours credit. Second semester.

Summer Session

Courses 101, 102, 111, 112, 151, 152, 161, and 162, or similar courses, will be given during the Summer Session of 1930.

CHEMISTRY

Professors Gomberg, Bigelow, Willard, Smeaton, and Bartell; Associate Professors Lichty, and Schoepfle; Assistant Professors Carney, Meloche, McAlpine, Ferguson, Hodges, Weatherill, Anderson, and Bachmann; Mr. Cole, Dr. Soule, Dr. Case, Dr. Halford, and Mr. Himes.

The aims of the fundamental course in general chemistry, required of all engineering students, are primarily the development of a scientific attitude, the acquisition of such chemical facts as form a part of the store of knowledge of any well-informed person, and preparation for the succeeding required course in the chemistry of engineering materials. Further courses in analytical, organic, and physical chemistry are required of students in chemical engineering, and may be elected by other students having the requisite preparation. Students intending to specialize in chemistry are advised to obtain a reading knowledge of both French and German.

The chemistry building provides excellent facilities for the work in all the schools and colleges of the University. Lecture
and classrooms, laboratories for class instruction and individual research, a fully equipped stock-room, and the chemical library are all located in the one building. The library contains about 8,000 volumes and is especially rich in complete sets of journals. Over 90 journals are currently received.

3. General and Inorganic Chemistry.* A study of the non-metallic elements and their compounds, with special emphasis upon the interpretation of chemical phenomena from the viewpoint of recent theory and investigation, accompanied by a systematically arranged course of laboratory experiments designed to illustrate the fundamental principles underlying the science. Two lectures, two recitations, and two two-hour laboratory periods. Four hours credit. Each semester.

5E. General and Inorganic Chemistry.* The fundamental principles of chemistry are developed in such a way as to illustrate the scientific method. The descriptive chemistry of some of the non-metallic elements and of all the more important metallic elements is studied as further illustration of the fundamental principles, special emphasis being placed on such facts as are of importance to the engineer. Two lectures, two recitations, and two three-hour laboratory periods. Open to students who have presented a unit of chemistry for entrance. An examination may be given to students enrolling in this course, and those whose preparation is shown to be inadequate will be transferred to Course 3, credit for which will be counted as a cultural elective. Five hours credit. Each semester.

6. General and Inorganic Chemistry.* A continuation of Course 3 dealing chiefly with the chemistry of the metallic elements. Lectures, recitations, and laboratory. Four hours credit. Second semester.

15. Qualitative Analysis. A study of the distinctive properties of some common substances in water solutions and the reactions used in the identification of such substances. Two recitations and two four-hour laboratory periods. Prerequisite: Course 5 or 6. Four hours credit. Each semester.

17. Qualitative Analysis. In this course the distinctive properties of some of the more common chemical compounds are

*Engineering students entering without chemistry will elect Courses 3 and 6. The credit for Course 3 will be allowed as a cultural elective if the student presents full entrance requirements, but otherwise will be entered as an admission requirement. Students presenting an approved unit of chemistry for entrance will take Course 5E, unless three or more years have elapsed since they studied chemistry, in which case they are advised to elect Courses 3 and 6. College credit for Course 3 will be allowed as a cultural elective for students presenting an entrance unit of chemistry.
studied, with special reference to their use in analysis. A con-
siderable number of unknowns are analyzed, and the student is re-
quired to show an understanding of the theory of dilute solutions
in discussing the reactions employed in the laboratory. Three
recitations and two four-hour laboratory periods. Prerequisite:
Course 5 or 6. Five hours credit. Each semester.

41. Elementary Theoretical and Physical Chemistry. In
this course special attention will be paid to the study of chemical
equilibrium, rate of chemical reactions, and applications of
physico-chemical theory. Three lectures or recitations. Prereq-
usites: Course 17 or 53, Physics 36, and a knowledge of calculus.
Three hours credit. First semester.

42. Elementary Theoretical and Physical Chemistry. This
course is similar in content to Course 41 and may be elected as
an alternative. Two lectures and two recitations. Prereq-
usites: Course 17 or 53. Four hours credit. Second semester.

43. Physico-Chemical Measurements. Methods for the
determination of molecular weight, viscosity, surface tension,
reaction rate, solubility, etc., optical measurements with polar-
imeter, refractometer, spectrometer. Laboratory work. Prereq-
usites: the student must have completed or must be taking Course
41 or 42, and 57. Three or four hours credit. Each semester.

53. Qualitative Analysis. A continuation of Course 15. The
course includes the identification of a wider range of substances
and the analysis of more difficult mixtures, including some alloys,
slags, phosphates, also studies in oxidation and reduction. Two
recitations and two four-hour laboratory periods. Four hours
credit. Each semester.

57. Quantitative Analysis. This course includes the study
of gravimetric, volumetric, and electrolytic methods, and the
analysis of simple mixtures. The solution of stoichiometric prob-
lems is emphasized. Two recitations and three four-hour labora-
tory periods. Prerequisite: Course 17 or 53. Five hours credit.
Each semester.

63. Organic Chemistry. This course is intended for stu-
dents who desire a more elementary course than Courses 67 and 69.
Prerequisites: Courses 3 and 6, or Course 15 or 17. Four hours
credit. Each semester.

67. Organic Chemistry. The properties and classification
of carbon compounds. Two lectures, one recitation, and two
four-hour laboratory periods. Prerequisite: Course 17 or 53.
Five hours credit. Each semester.
69. **Organic Chemistry.** Continuation of Course 67. Lectures, recitations, and laboratory work. Five hours credit. Each semester.

105. **History of Chemistry and Development of Chemical Theory.** Lectures and seminary. Two hours credit. Each semester.

111. **Electrochemistry.** An elementary treatment of the fundamentals of the subject. Two lectures. *Must be preceded or accompanied by Course 41 or 42.* Two hours credit. First semester.

112. **Applied Electrochemistry.** Application of principles of electrochemistry to analytical and industrial processes. Two lectures. *Prerequisite: Course 111.* Two hours credit. Second semester.

113. **Electrochemistry Laboratory.** Measurements of conductivity, resistance of primary and secondary cells, current by means of coulometers, single electrode potentials, overvoltage, transport numbers, electromotive force, including hydrogen electrode, and methods of electrochemical analysis. Laboratory work. *Open to those who have completed or are taking Course 111.* Two hours credit. First semester.

125. **Colloid Chemistry.** In this course the student will be given the fundamental principles of colloid chemistry. Two lectures. *Open only to those obtaining permission of the instructor.* Two hours credit. First semester.

127. **Colloid Chemistry Laboratory.** An application in the laboratory of the principles of colloid chemistry. Laboratory work. *Must be preceded or accompanied by Course 125.* Two hours credit. First semester.

131. **Physico-Chemical Measurements.** A continuation of Course 43. The work includes electrical measurements such as conductivity, transport numbers, and electromotive force, work with the hydrogen electrode, experiments with colloids, and the determination of some of the more important physico-chemical constants. One to four hours credit. Each semester.

132. **Advanced Theoretical and Physical Chemistry.** A continuation of Course 41. Special attention is given to rate of chemical reactions and chemical equilibria in both homogeneous and heterogeneous systems. The work includes also a brief survey of recent advances in the field of physical chemistry. Two lectures. Two hours credit. Second semester.
145. **Advanced Quantitative Analysis.** Application is made of the principles laid down in Course 57 to the analysis of some technical products, including coal, iron, and other ores, a silicate rock, and ferrous and non-ferrous alloys. Lectures and quiz, twice a week; laboratory, two or three periods a week. **Prerequisites:** Course 57 and Physics 36. Four or five hours credit. Each semester.

147. **Special Problems in Analytical Chemistry.** A study of some of the more difficult and uncommon problems of quantitative analysis. The student is left largely to his own resources. Laboratory work. **Prerequisite:** five hours of Course 145. Five hours credit. Each semester.

163. **Advanced Organic Chemistry and Ultimate Analysis.** Laboratory work and reading. **Prerequisites:** Courses 67 and 69. Two to five hours credit. Each semester.

165. **Advanced Organic Chemistry.** Two lectures, and reading. **Prerequisites:** Courses 67 and 69. Two hours credit. First semester.

166. **Advanced Organic Chemistry.** Two lectures, and reading. **Prerequisites:** Courses 67 and 69. Two hours credit. Second semester.

242. **Physico-Chemical Methods in Quantitative Analysis.** Lectures and laboratory work. **Prerequisites:** Courses 41 and 145. Two hours credit. Second semester.

**Summer Session**

Courses 3, 6, 17, 34, 41, 43, 57, 63, 65, 67, 69, 105, 111, 125, 127, 131, 145, 147, 163, 166, as described for the regular session, or similar courses, will be given in the Summer Session of 1930.

**ECONOMICS**

Professors Sharfman, Paton, and Goodrich; Associate Professors Watkins and Elliott; Assistant Professors Caverly, Peterson, and Ellis; Mr. Mason, Mr. Briggs, Dr. Timoshenko, and Mr. Yntema.

Courses 53 and 54 listed below are of particular interest to those students in the College of Engineering who wish to have a general survey of economics and do not expect to take any considerable program in the subject. In addition, there are enumerated a number of courses in economics which will prove of interest and value to such students of Engineering as are able to devote a larger amount of time to outside fields of study. For a more
detailed announcement of these courses and for additional courses in the field of economics, consult the Announcement of the College of Literature, Science, and the Arts.

Students who elect any course without first completing the necessary prerequisites will be denied credit in that course.

51. Principles of Economics I. This course, with Course 52, its continuation in the second semester, furnishes a general introduction to the science of economics. It is designed for students who wish to prepare themselves for advanced work in the field of economics or who desire a thorough grounding in economic principles. Lecture and discussions. Successful completion of Courses 51 and 52 is a prerequisite to election of other courses in the Department. Not open to freshmen. Three hours credit. Each semester.

52. Principles of Economics II. This course is a continuation of Course 51. Lecture and discussions. Successful completion of Courses 51 and 52 is a prerequisite to election of other courses in the Department. Three hours credit. Each semester.

53. General Economics I. This course is designed to meet the needs of students, particularly in professional departments, whose chief work lies outside the field of economics, but who desire a general course in economic principles and problems. Opening with a brief description of present-day industrial organization, the course will consider the fundamental economic principles of production, exchange, and distribution. It will then examine the application of these principles to current problems of labor, money and banking, public utilities, trusts, and taxation. This course continues through the second semester as Course 54. Courses 53 and 54 will not be accepted as prerequisites to other courses in the department. No student will receive credit for both this course and Course 51, or Course 153. Three hours credit. First semester.

54. General Economics II. This is a continuation of Course 53. During the second semester primary emphasis will be placed on application of principles to current economic problems of public significance. Prerequisite: Course 53. Courses 53 and 54 will not be accepted as prerequisites to other courses in the department. Three hours credit. Second semester.

101. Money and Credit I. This course undertakes an analysis of theories of money and credit, of bank operations and their relation to production and capital supply, and of the relationship between bank credit, money, and prices. Attention is given to monetary and banking history in the United States, and a
preliminary study is made of the organization of the Federal Reserve System. This course should be followed by Course 102. 

Prerequisites: Courses 51 and 52. Three hours credit. First semester.

102. Money and Credit II. This course is a continuation of Course 101. It includes study of the gold standard and of the foreign exchanges. After consideration of several foreign banking systems, an intensive study is made of the actual operation of the Federal Reserve System and the war and post-war conditions. 

Prerequisite: Course 101. Three hours credit. Second semester.

121. Labor. This course is intended as an approach to the understanding of the problems of the workers and of the problem of labor efficiency. After an introductory account of the rise of permanent groups of wage-earners, it will discuss their lives and work in terms of such problems as wages, monotony, and insecurity; and it will discuss turnover, sabotage, strikes, and the growth of the labor movement as indications of industrial unrest. In conclusion, it will examine briefly the remedies which are attempted or proposed by employers, unions, and the government, and which form the subject-matter of Labor II A (Industrial Relations) and Labor II B (The State in Relation to Labor). Discussion and occasional lectures. 

Prerequisites: Courses 51 and 52. Three hours credit. First semester.

131. Industrial Combinations. This course is primarily concerned with the relationship of the state to the organization and functioning of commercial and industrial enterprises. After a brief consideration of the forms of business association, with special reference to the nature and significance of the corporate organization of industry, it traces the development of the combination movement in its various aspects, attempts to discover the basic causes and significant effects of concentration of control, examines the character and forms of "unfair competition," and subjects to detailed analysis the evolution of public policy toward combination, co-operation, and the plane of competitive conduct. 

Prerequisites: Courses 51 and 52. Three hours credit. Second semester.

133. Railroad Regulation. This course is designed to acquaint the student with the system of public control of railroads which has been developed in the United States. It examines the legal and economic characteristics of the railroad industry, analyzes the principal railroad problems which have emerged and undertakes a detailed study of the character and development of government regulation. 

Prerequisites: Courses 51 and 52. Three hours credit. First semester.
153. Elements of Economics. *For senior and graduate students having time for only a semester's work in economics.* The more significant laws and relationships of modern industrial society are explained and illustrated with the idea of furnishing the student a body of principles of use in interpreting current situations. The organization of production, monopoly, money and credit, banking, foreign trade and the tariff, distribution of wealth and income, government regulation of industry, and problems of labor, are among the subjects treated. Lectures and quizzes. Students planning to take an extended program in economics should take Courses 51 and 52. Three hours credit. Each semester.

171. Principles of Accounting I. This introductory course consists primarily in a study of the fundamentals of the double-entry system and an examination of the principal technical devices of accounting in terms of typical business transactions and conditions. Special attention is given to periodic operations, to the construction of simple financial statements, and to the classification of accounts for managerial and other purposes. Three hours credit. Each semester.

172. Principles of Accounting II. This is a continuation of Course 171. It includes practice in the construction of working sheets, a study of the principal types of income statements and balance sheets, a survey of the problems of valuation and income determination, a consideration of partnership accounting, and an introduction to corporate accounting. Three hours credit. Each semester.

173. Elements of Accounting. A survey of the accounting field with emphasis upon fundamental principles. Unless special permission is granted it does not qualify for admission to any course in the Department of Economics or in the School of Business Administration for which Courses 171 and 172 are the regular prerequisites. *Primarily for seniors, graduates, and students in their last semester of residence, whose chief interest is in other departments but who wish to have some knowledge of accounting.* Prerequisites: any introductory course in economics, or permission of instructor. Three hours credit. Each semester.

175. Economic Statistics I. This course and Course 176 are designed to cover the elements of statistical analysis as applied to economic data. The topics to which most attention is given in the first semester's work are frequency distributions, averages, dispersion, and correlation. Students who have had Mathematics 49 may take this course also for credit, but Mathematics 49 is not a prerequisite. Two hours a week of lecture and two hours of laboratory work. *Prerequisites: Courses 51 and 52.* Three hours credit. First semester.
176. Economic Statistics II. This course is a study chiefly of time series in economic data, with an analysis of the business cycle, and index numbers. Also some of the topics of the first semester's work will be reviewed and carried further. Students who have had Mathematics 50 may take this course, but it is not a prerequisite. Two hours a week of lecture and two hours of laboratory work. Prerequisites: Economics 175 or Mathematics 49. Three hours credit. Second semester.

177. Elements of Statistics. This is an attempt to present in one semester, for those who cannot give more time than that, the most important ideas and methods studied in Courses 175 and 176. For students who have had Mathematics 49 and can take only one semester's work in economic statistics, Course 176 is a better choice than Course 177. Two hours of lecture or quiz each week and two hours of laboratory work. Prerequisites: Courses 51 and 52. Three hours credit. Each semester.

181. Elements of Public Finance. This course undertakes a general survey of the field of public finance and taxation. Beginning with a brief analysis of the character and trend of public expenditures, the various forms of public revenue will be discussed, with particular attention to the principles and problems of taxation. The course will conclude with an examination of the nature and effects of public indebtedness and a discussion of the problems and expedients of war-financing. Prerequisites: Courses 51 and 52. Three hours credit. First semester.

182. Taxation. This course offers an opportunity for a more intensive study of the principles, the incidence, and the economic effects of taxation, than is possible in Course 181. It will include a description of the systems of national, state, and local taxation in the United States and a discussion of current proposals for tax reform. Prerequisites: Course 181, or special permission of the instructor. Three hours credit. Second semester.

Summer Session

Courses 51, 52, 101, 121, 131, 133, 134, 153, 173, 181, 192, and 197 were offered during the Summer Session of 1929. Similar courses will be given during the Summer Session of 1930.
write effectively. It is further assumed that they need, as a means of wholesome and sensible enjoyment, as well as a means of extending their fund of ideas, a real and intelligent interest in reading. The attempt has therefore been made to afford the students in these colleges throughout their four years a liberal choice of courses in composition, both written and oral, and in the appreciative and critical reading of literature. The freshman requirement includes a combination course of reading and writing in about equal amounts and a two-hour practice course in public speaking. Following these required courses students may elect during their first and second years from Group 2 as many two-hour courses as their schedules will allow. These courses include: 3 and 4, public speaking courses; 5, an advanced composition course; and 20, 21, 22, 23, courses in the appreciation of different phases of literature. These courses are in contemporary literature and are not limited to English literature. In the third or fourth year students may continue their electives from Group 3 as extensively as their time permits. The requirement is made absolute, however, that they must choose one two-hour course from this Group during their last two years. These courses include: 6, a course in report and thesis writing; 7, an advanced course in public speaking; and 24, 25, 26, 27, 28, 29, 30, courses in literature. Practically all these courses offer a more critical study of the older literary forms.

Facilities.—The English Department has a collection of about six hundred volumes at present located in an alcove in the Chemical Engineering Library on the third floor of the East Engineering Building. Originally intended for classes in English 24, the collection has been enlarged considerably to supplement the General Library where its resources were inadequate for the other reading courses offered by this Department. Most of the books are for class assignment or reference, and a sufficient number of copies of the more expensive works has been provided to relieve the student of the burden of a heavy financial outlay in those courses requiring extensive reading in books of recent copyright.

General Requirements.—All regular students in the Colleges of Engineering and Architecture are required to take six hours of English. In the College of Engineering this consists of Courses 1 and 2 and a two-hour writing course in the junior or senior year, which must be chosen from Group 3. Students in Civil Engineering will take English 6. No other courses can be substituted.

In the College of Architecture the student may take in addition to Courses 1 and 2 any two-hour English course. This course may be taken at any time during the four years, unless the student elects one of the courses open to juniors and seniors only.
Special Requirement for Foreign Students.—All students whose native language is other than English shall, upon matriculation and enrollment in these colleges, be required to report at once to the Chairman of the Committee on English. Such students shall satisfy the Committee that they possess a sufficient knowledge of English to carry on work in these colleges before they may be classified. Provision is further made for the guidance of these students by the Committee on Foreign Students until their knowledge of English is sufficient to enable them to do their regular work without any apparent handicap.

All such students have laid out for them a course in English, French, German, or Spanish, which shall satisfy the modern language requirements for graduation. In their case English may be substituted for another modern language, the maximum assignment being 17 hours, and it is understood that English shall be continued until the English faculty is satisfied that they have a good working knowledge of both written and spoken English.

All foreign students, unless they come with advanced credit in English, must go into English 1a, the special course in English for foreign students. At the end of two weeks, however, those students who have demonstrated their ability to do the regular freshman work in English will go into English 1 and 2, while those who need special help will remain in English 1a. This course gives the students five hours of class work specially planned to help them overcome their language difficulties. This plan aims to economize the time and effort of the foreign students and to make sure that on graduation from an American university they may have a reasonable command of English.

Group I—Freshman Requirement

All freshmen in the College of Engineering and Architecture must take both English 1 and 2 and must take them the same semester.

1. Theme-Writing. Review of the fundamentals of composition; constant practice in writing, supplemented by study of works of recognized literary quality. Weekly prepared themes, frequent impromptus. This course is a prerequisite for all courses in English except Course 2. Three hours credit. Each semester.

1a. English For Foreign Students. Correction of individual speech defects; dictation; drill on vocabulary and pronunciation; practice in conversation and writing. All foreign students must take this special course until they have demonstrated their ability to take Courses 1 and 2. Two hours credit for five hours of class work. Each semester.
2. **Oral Exposition.** Practice course in public speaking, which must be taken at the same time as Course 1. Two hours of class work. One hour credit. Each semester.

**GROUP 2—ELECTIVE COURSES**

These courses, which may be taken at any time after a student has completed his freshman requirement, give credit as cultural electives.

3. **Public Speaking For Engineers.** A study of the problems of organization, illustration, and effective presentation in public address, affording frequent opportunity for practice and class criticism. **Prerequisites:** Courses 1 and 2. Two hours credit. Each semester.

4. **The Lecture: Scientific, Popular, and Technical.** The preparation and delivery of lectures on scientific subjects intended for scientific societies or for popular assemblies; presentation of technical reports and demonstration methods. **Prerequisites:** Courses 1 and 2. Two hours credit. Second semester.

5. **Advanced Composition.** Practice work in the various forms of composition. **Prerequisites:** Courses 1 and 2. Two hours credit. Second semester.

20 (Formerly 21). **Readings in Contemporary Literature.** Rapid reading of representative works by outstanding authors of America, England, and continental Europe; study of these works as the expression of the spirit and ideals of modern life. **Prerequisites:** Courses 1 and 2. Two hours credit. Each semester.

21 (Formerly 26). **The Contemporary Drama.** Study of the modern drama since the plays of Ibsen; emphasis on the development of intelligent standards of judgment and their application to the criticism of the contemporary theater. **Prerequisites:** Courses 1 and 2. Two hours credit. Each semester.

22 (Formerly 23). **The Contemporary Novel.** A study of outstanding American and European novels since 1890 with emphasis upon their significance, literary form, and stylistic qualities. **Prerequisites:** Courses 1 and 2. Two hours credit. Each semester.

23 (Formerly 24). **The Short Story.** Reading and analysis of a large number of short stories with a view to defining the literary genre, tracing its development, noting present tendencies, and formulating standards of judgment. **Prerequisites:** Courses 1 and 2. Two hours credit. Each semester.
GROUP 3—UPPERCLASS REQUIREMENTS

These courses, which are open to juniors and seniors only, may be taken to satisfy the junior-senior requirement, and may also be taken as cultural electives. Students will be held strictly to a standard of good English usage.

6. Report-Writing. The engineering report as a special type of exposition to which are applicable the fundamental principles of general exposition. Lectures, conferences, daily exercises, and two major assignments correlated as closely as possible with the technical work of the student. Prerequisites: Courses 1 and 2. Open to seniors only. Two hours credit. Each semester.

7. Argumentation and Debate. Study of problems most commonly met by engineers in furthering their projects; emphasis on clear, logical thinking, and convincing argument; frequent opportunity for extemporaneous presentation of material. Prerequisites: Courses 1 and 2. Two hours credit. Each semester.

24 (Formerly 14). The Engineer and His Reading. Readings in literature dealing with the problems and tendencies of modern society. Prerequisites: Courses 1 and 2. Two hours credit. Each semester.

25. The Drama. An introduction to the drama as a type with special attention to its various developments in different ages and cultures. Prerequisites: Courses 1 and 2. Two hours credit. First semester.

26 (Formerly 22). The Novel. Readings and discussion of major works in the prose fiction of the 18th and 19th centuries. Prerequisites: Courses 1 and 2. Two hours credit. Each semester.

27. Studies in the Literature of Science. The literature of science; review of the work of the great historic figures in the scientific field, and readings from more recent and contemporary scientists. Prerequisites: Courses 1 and 2. Two hours credit. Each semester.

28. Studies in American Prose Literature. A rapid reading of the works of representative American essayists, dramatists, and writers of fiction, with emphasis upon their literary form, historical associations, and portrayal of American life. Prerequisites: Courses 1 and 2. Two hours credit. Each semester.

29 (Formerly 20). Studies in Literary Masterpieces. Introduction to works of exceptional merit in the various literary types. Prerequisites: Courses 1 and 2. Two hours credit. Each semester.
30. **Studies in Shakespeare.** Rapid reading and study of eight of the principal plays with a view to awakening keen and intelligent interest. **Prerequisites:** Courses 1 and 2. Two hours credit. Each semester.

**Summer Session**

Courses 1, 2, and 28, or similar courses, will be given during the Summer Session of 1930.

---

**59. FINE ARTS**

**HISTORY OF ART**

Associate Professor **DONALDSON**; Miss **ADAMS**

The courses offered in this Department purpose to give the student a comprehensive survey of the origin and development of the fine arts. Chief emphasis is placed upon the evolution of architecture, sculpture, and painting from prehistoric times to the present. The approach to the subject matter is essentially historical.

Fine Arts 101 is the prerequisite for all advanced courses and covers the material up to the general period of the Renaissance.

The other courses are concerned with the Renaissance in Italy, France, and Spain; American Art; and Oriental Art.

All elections in the following courses must be made in Room B, Alumni Memorial Hall, between 10 and 12 or between 2 and 5 on registration days.

101. **General Introductory Course in the History of Art.** An investigation of the rise and development of the fine arts from prehistoric times to the Renaissance. A brief historical survey, intended both as a general cultural course and as a background for the further study of particular periods or phases of art. Illustrated lectures, required reading, and written tests. **Open to sophomores, juniors, and seniors, subject to the approval of the Department.** Three hours credit. Each semester.

114. **The Renaissance in France.** The history of the fine arts in France from the fifteenth to the twentieth century. Illustrated lectures, required reading, and written tests. **Open to juniors and seniors who have completed Course 101 with a grade of B or better.** Two hours credit. First semester.

115. **Italian Renaissance Architecture and Sculpture.** The history of architecture and sculpture in Italy during the late fourteenth, the fifteenth, the sixteenth, and early seventeenth centuries. Illustrated lectures, required reading, and written tests. **Open to sophomores, juniors, and seniors who have completed**
FINE ARTS

Course 101 with a grade of B or better. Three hours credit. Second semester.

117. The Renaissance in Spain. The history of the fine arts in Spain, from the fifteenth through the nineteenth century. Illustrated lectures, required reading, and written tests. Open to sophomores, juniors, and seniors who have completed Course 101 with a grade of B or better. Two hours credit. Second semester.

128. American Art. The history of architecture, sculpture, and painting in the United States from colonial times to the present. Illustrated lectures, required reading, and written tests. Open to juniors and seniors who have completed Courses 101 and 114, 115 or 117 (preferably 115) with a grade of B or better. Three hours credit. First semester.

130. Central Italian Renaissance Painting. A study of the development and character of painting in Central Italy from the Byzantine period to the nineteenth century, with special attention to the Florentine School of the fifteenth century. Illustrated lectures, required reading, and written tests. Open to juniors and seniors who have completed Course 101 with a grade of B or better. Two hours credit. First semester.

135. North Italian Renaissance Painting. A study of the development and character of painting in Northern Italy from the Byzantine period to the nineteenth century, with special attention to the Venetian School. Illustrated lectures, required reading, and written tests. Open to juniors and seniors who have completed Courses 101 and 130 with a grade of B or better. Two hours credit. Second semester.

150. Oriental Art. An introduction to the fine arts of the Near East and Far East. A historical review of architecture in Mohammedan countries and of architecture, sculpture, and painting in India, China, and Japan. Illustrated lectures, required reading, and written tests. Open to juniors and seniors who have completed Course 101 and one course in the Renaissance with a grade of B or better. Two hours credit. Second semester.

CREATIVE WORK IN SCULPTURE

Associate Professor Fairbanks

151. The Theory and Technique of Sculpture, with a study of the processes. Prerequisite: permission of the instructor. Two hours credit. First semester.

152. The Theory and Technique of Sculpture. Continuation of Course 151. Two hours credit. Second semester.
153. Creative Studies in Sculpture, with emphasis on problems in sculpture. **Prerequisites:** Courses 151, 152, or equivalent, and permission of the instructor. Two hours credit. First semester.

60. **FORESTRY AND CONSERVATION**

Professors Dana, Matthews, Allen, and Graham; Associate Professors Young, Kynoch, and Craig; Assistant Professors Jotter, Baxter, Dearborn, Wight, and O'Roke.

All forestry courses are given in the Natural Science Building and in the Wood Utilization Laboratory.

31. **Introduction to Forestry.** Economic and social importance of forestry. History of forestry in the United States and abroad. Character, distribution, and utilization of our timber resources. Factors influencing tree growth. How the forest is reproduced and cared for. Influence of forests on climate, streamflow, and erosion. Forestry as a profession. Three lectures. **Not open for credit to candidates for a degree in forestry.** Three hours credit. Each semester.

33. **Identification of Trees and Commercial Woods.** Identification of our native trees and of the woods in common use. Two laboratory or field periods and outside reading. **Not open for credit to candidates for a degree in forestry.** Limited to one section of twenty students; those desiring to take the course should consult the Recorder of the School of Forestry and Conservation as promptly as possible. Two hours credit. Each semester.

39. **Conservation of Wild Life.** This course considers wild animal life from the standpoint of a valuable natural resource, and discusses the principles and methods applicable to its preservation and use. Our native animals are shown to constitute an economic and social asset of great importance, both in intensively managed forests and in national and state parks and wilderness. Emphasis is laid on the extent of these resources, their intelligent administration, and their relation to the public. Two lectures. Two hours credit. First semester.

163. **Wood-Using Industries of the United States.** Wood-using industries of the United States; location and economic importance; kind, amount, and source of wood used by representative industries; methods and costs of manufacture; marketing and
utilization of finished product. Three lectures. Three hours credit. First semester.

164. Structure and Properties of Wood. Structure of our native woods, with special reference to identification and properties; relation of properties to industrial utilization. Two lectures and two laboratory periods. Prerequisite: Physics 35. Four hours credit. Second semester.

165. Conditioning and Preservative Treatment of Wood. Air seasoning, kiln drying, and preservative treatment of woods. The laboratory work includes operation of a semi-commercial kiln and wood-preserving plant. Two lectures and one laboratory period. Prerequisite: Forestry 164. Laboratory to be arranged. Three hours credit. First semester.

167. Timber Mechanics. Study of the mechanical properties of woods and of the methods used in obtaining data on these properties; practical application of strength data. The laboratory work includes standard strength tests on native woods in a well-equipped timber-testing laboratory. One lecture and one laboratory period. Prerequisite: Forestry 164. Two hours credit. First semester.

168. Chemical Utilization of Wood. Use of woods for the making of pulp and paper, artificial silk, and other cellulose products, and for distillation and miscellaneous products. Two lectures, with occasional laboratory work. Prerequisites: Forestry 164 and Chemistry 5 or 6. Two hours credit. Second semester.

187. Plantation Management in the Tropics. Economic and administrative problems of plantation management in the tropics, with special attention to rubber production. Selection and administration of large land holdings in the various countries of the tropics; labor and other practical problems involved. Valuation of tropical land and timber properties. Two lectures. Open only to juniors, seniors, and graduate students. Two hours credit. First semester.

194. Conservation of National Resources. Natural resources of the United States in land, forests, minerals, and water; their contribution to the economic and social development of the country; importance and methods of conserving them. Application of the conservation philosophy to human resources, labor, industry, and commerce in general; its importance as the basis of permanent national prosperity. Three lectures. Three hours credit. Each semester.
61. GEOLOGY

Professor Hobbs and others

The Department of Geology is located in the Natural Science Building, occupying the northern half of the eastern front and extending through the four floors of the building.

31. Physical Geology. A general course leading to an understanding of the principles of physical geology; required of students of Civil Engineering and Geodesy and Surveying, and open to others as an elective. Lectures M, F, at 11 and one-hour quiz, Tu, at 10 or 11, W, at 10 or 11, and Th, at 11. Two hours of laboratory per week, M, Tu, or Th, from 3 to 5. In the second semester the Tuesday period is omitted. Professor Hobbs and assistants. Three hours credit. Each semester.

For other courses in Geology to which students of Engineering are eligible, see the Announcement of the College of Literature, Science, and the Arts. It is suggested that Courses 32 (Historical Geology), 131 (Soil Geology), 133 and 134 (Economic Geology), are especially useful courses for Engineering students.

Summer Session

Courses 31, 32, 105, 201, and 209, or similar courses, will be given during the Summer Session of 1930.

62. LANDSCAPE DESIGN

Professor Tealdi; Assistant Professors Whittemore, and Cone.

These courses are not open to those below the rank of junior.

101. Introduction to the Study of Landscape Design. Lectures, collateral reading, and reports. Course 101 is designed to give a general knowledge of the variety of problems to be met with in the practice of landscape design. It is not intended as a technical course, such as a course in construction or design. The general problems are treated separately and special stress is laid upon the subject of good taste and common sense in all problems, from the simple arrangement of the city yard to the laying out of a country estate. The lectures are illustrated by the use of the stereopticon. Two hours credit. First semester.

102. City Planning and Civic Improvement. Course 102 is offered with the express purpose of stimulating civic spirit and a desire for further investigation among those who would like to keep abreast of the movement for civic improvement and who are interested in its sane development. Among the subjects treated are the following: city layout, streets, bridges, squares, public buildings, parks, trees, and other natural assets; city nuisances,
problems of wires and advertisements as they affect the appearance of the city; dirt, smoke, and noise as they affect life in the city. Special stress is laid upon the housing problem, particularly as it is affected by the Garden City movement. Two hours credit. Second semester.

111. **Professional Introductory Course.** Course 111 includes a more technical presentation of the subject, time being devoted to the study of plans, elementary design, field trips, reports, etc. Three hours credit. First semester.

112. **City Planning and Civic Improvement.** This course includes a more technical presentation of the subject, time being devoted to the study of plans and elementary design. Reports and quizzes. It may be considered a practical introduction to city planning. Three hours credit. Second semester.

**Summer Session**

Courses 101 and 102 will be given during the Summer Session of 1930.

63. **MECHANISM AND ENGINEERING DRAWING**

Professor Miller; Associate Professors Goulding, Finch, and Palmer; Assistant Professors Hansen, Potts, Morley, Bukovsky, Clark, Cole, and Eichelberger.

Drawing Courses 1, 2, 3, and 4 carry the student through the subjects of elementary mechanical and machine drawing, descriptive geometry, drafting-room practice, sketching, and mechanism. These four courses have been arranged for the first semesters of the four-year curriculum in order that they may form a continuous chain of instruction that will, first, fit those students who continue during the third and fourth years to take up with the least difficulty and proceed with the maximum efficiency in the courses in design, etc., and second, be of the maximum assistance to that large percentage of students who do not continue longer than from one to two years. Instruction is also given in statistical charting and advanced mechanism.

Courses in elementary mechanical drawing and sketching especially designed for dental and medical students are offered as Drawing 1d and 1m.

A long sought aim of the Department has been realized in the reduction of its classes to fifteen men or less. This gives the opportunity for that personal contact and acquaintance between the instructor and his students that is of so great value. The work is conducted in well-lighted and well-equipped drafting-rooms, and all necessary facilities essential to the proper teaching of the subjects named are available.
1. **Mechanical and Machine Drawing.** The principles of orthographic projection; practice in the making of working drawings; correct drafting-room practice in conventional representation; the use of instruments; practice in lettering, free-hand for dimensions and notes, and mechanical for titles; reading and checking of drawings; drill on geometric constructions; instruction on blue and brown printing; practice in tracing; original drawing on vellum. Three two-hour drafting-room periods, three hours home work a week. Three hours credit. Each semester.

1d. **Dental Drawing.** Use of instruments; practice in lettering; practice in the making of working drawings, particularly of dental appliances; outline sketching of subjects of dental anatomy; pencil shading of sketches. Four hours drafting-room a week. One hour credit. Each semester.

1m. **Medical Drawing.** Use of instruments; practice in lettering; outline sketching of subjects of human anatomy; pencil shading of sketches; practice in the making of working drawings, particularly of medical appliances. Four hours drafting-room a week. One hour credit. Each semester.

2. **Descriptive Geometry.** Exercises, instruction, and drill through the medium of 80 printed plates of problems comprising combinations of the point, line, and plane, intersections, developments, tangent planes, and warped surfaces. Three two-hour periods drafting-room, three hours home work a week. Prerequisite: Course 1. Three hours credit. Each semester.

3. **Mechanism and Sketching.** Sketching of die-cast models in orthographic, isometric, and oblique projection; practice in the making of working drawings from sketches; free-hand lettering; special practice in, and applications of drawing. Two two-hour drafting-room periods, two hours home work a week. Prerequisite: Course 2. Two hours credit. Each semester.

4. **Mechanism.** Principles of mechanism; purposes of variations of elementary mechanisms, gears, cams, bands, etc.; analysis of special machines, process and history of their development and their economic importance; systematic development of complicated machines to accomplish specified purposes. Two two-hour drafting-room periods, two hours of home work a week. Prerequisite: Course 3. Two hours credit. Each semester.

6. **Advanced Mechanism.** Further instruction and drill in the development of complicated machines to accomplish specified purposes; proper description of designs for patent applications; history of development of type machines. Three hours drafting-
room a week. *Prerequisite: Course 4.* One hour credit. Each semester.

12. Statistical Charting. Analytical methods of charting; construction, use, and analysis of statistical charts, and applications to industrial, social, transportation, or other statistical problems. Three hours drafting-room a week. Two hours credit. Each semester.

**Summer Session**

Courses 1, 1d, 2, and 3, or similar courses, will be offered during the Summer Session of 1930.

64. MILITARY SCIENCE AND TACTICS

Professor Edwards; Assistant Professors Turner, Lord, Powell, and Curtis.

The student elects his Military Science courses at the same time and place as he elects his other University courses and receives academic credit therefor which counts toward graduation. He also enrolls at the Headquarters, Reserve Officers Training Corps, on the campus. Students electing Military Science are excused from the required gymnasium work.

Enrollments are for a period of four semesters; that is, for either a Basic Group or an Advanced Group in its entirety. The first four semesters constitute the Basic Group, and the second four semesters the Advanced Group. Once enrolled in either group the completion of that group becomes a prerequisite to graduation unless the student is discharged from this obligation upon the recommendation of the Professor of Military Science and Tactics.

A deposit of $12.50 to cover property responsibility is required of each student.

**Infantry.—**Theoretical and practical work which will enable a student to understand and make proper use of infantry weapons and handle a company of infantry according to modern tactical principles. Open to all students.

**Ordnance.—**For the first two years the student may follow any basic course. The Infantry is recommended. During the last two years he gets special technical training in design and manufacture of ordnance and methods of supply and maintenance. In view of the fact that the Ordnance Department is a technical and manufacturing branch of the Army, a student during the advanced course takes certain technical subjects in his own college which tend to make him more of a specialist in his own line, and therefore, of more value to the Ordnance Department.
Open to prospective mechanical and chemical engineers, and Business Administration students.

**Signal Corps.**—After the first year, the student receives such instruction as will tend to make him expert in communication work. Open to prospective electrical engineers and others interested in electrical communications.

Course 1 is common to all units.
Course 2 is common to all units except the Signal Corps who take Course 12 second semester.

Upon election of a particular branch of engineering, R. O. T. C. students previously enrolled in an inappropriate unit may transfer to the unit to which their Engineering Department election makes them eligible without loss of credit.

The courses in Military Science and Tactics are designed to give a thorough groundwork in military subjects considered necessary as a part of the education of a commissioned officer in the Reserve Corps of the Army of the United States. Courses are offered in Infantry, in Ordnance, and in Signal Corps training organized as units of the Reserve Officers Training Corps, in which membership is limited to male citizens of the United States who are physically fit for service in the field.

While taking work in the Advanced Group, members of the R. O. T. C. receive payment of commutation of subsistence from the Government amounting to over $200. Students who enroll late may double up their courses. Four semesters' time must be put in, however, before they become eligible for payment of commutation.

In the Advanced Group, there is a summer camp of six weeks' duration. Attendance at the Advanced Camp is a prerequisite to graduation for students in the Advanced Group. Equipment is furnished and expenses at the camps are paid by the Government.

Successful completion of the courses in any unit of the R. O. T. C. will lead to a recommendation for a commission in the corresponding branch of the Officers Reserve Corps.

Enrollment in an R. O. T. C. Group is not an enlistment in a component of the Army nor does it carry with it any obligation for service at any time.

The following courses are given within the various units:

**Signal Corps**

**Basic Group**

1. **Elementary Infantry.** Same as Course 1, Infantry. One hour credit. First semester.

12. **Elementary Infantry and Telephony.** A general course of lectures and practical work in fundamental infantry subjects,
such as guard duty, military courtesy and discipline, infantry drill, ceremonies, hygiene, and military telephony. One lecture, one conference, and one one-hour drill period. One hour credit. Second semester.

14. Field Radio Sets. Recitations, lectures, and laboratory work. Installation, operation, and care of radio sets, sending and receiving. One lecture, one recitation, and one drill period of one hour each a week. One hour credit. Second semester.

ADVANCED GROUP

15. Signal Corps Organization and Tactics; and Signal Communications. Lectures and laboratory work in organization and tactics of the Signal Corps and the combined arms, and signal communications. Two lectures of one hour each, one laboratory period of two hours, and one drill period a week. Two hours credit. First semester.

16. Military Law; Military History and Policy; Company Administration; Field Engineering. Elements of common law, military law, moot court-martial, rules of land warfare, military policy, company organization and administration, supply and transportation, staff organization and duties, and field engineering. Two lectures of one hour each, one laboratory period of two hours, and one drill period a week. Two hours credit. Second semester.

17. Communication Engineering. Course 165 in Physics (Vacuum Tubes in Radio Communication) satisfies the requirements of this course. Two hours credit. First semester.

18. Communication Engineering. Course 10 in Electrical Engineering (Advanced Theory of Electrical Circuits) satisfies the requirement of this course. Two hours credit. Second semester.

INFANTRY

BASIC GROUP

1. Elementary Infantry. Infantry drill regulations, marksmanship, and military policy. One lecture, one conference and one drill period of one hour each a week. One hour credit. First semester.

2. Elementary Infantry, Continued. Fundamental subjects in military training, to include infantry drill regulations, military hygiene and first aid, scouting and patrolling. One conference, one lecture, and one drill period of one hour each a week. One hour credit. Second semester.
23. **Automatic Rifle; Musketry; Infantry Drill Regulations.**
Practical work in construction, operation, and use of the Browning automatic rifle. Lecture and practical work in the use of the combined fire of several rifles and the automatic rifle. One conference, one lecture, and one drill period of one hour each a week. One hour credit. First semester.

24. **Combat Principles; Scouting and Patrolling, Drill and Command.**
Theoretical and practical instruction in handling men, infantry organizations; training in the methods of gaining information of the enemy prior to and during combat. One conference, one lecture, and one drill period of one hour each a week. One hour credit. Second semester.

**ADVANCED GROUP**

25. **Command and Leadership; Military Map Reading and Sketching; Combat Principles.**
Theoretical and practical instruction in handling men; lectures and practical work in reading and making military maps. One lecture, one drill period of one hour each, one laboratory period of three hours a week. Two hours credit. First semester.

26. **Machine Guns; 37 mm Gun and 3" Mortar, Drill, and Command.**
Lecture and practical work in machine gun, 37 mm gun, 3" mortar, and in the exercise of command appropriate to all grades. One conference, one drill period of one hour each, one laboratory period of three hours a week. Two hours credit. Second semester.

27. **Minor Tactics; Field Engineering; Drill and Command.**
Lecture and practical work in the offensive and defensive combat of small units, tactical employment of infantry weapons, sand-table exercises, map and terrain problems. Disposition of infantry weapons and units for defensive combat. One lecture, one conference, one drill period of one hour each, one laboratory period of two hours a week. Two hours credit. First semester.

28. **Military Law; Military History and Policy, Administration, Drill and Command.**
Elements of common law, military law, moot court-martial, rules of land warfare, military policy, company organization and administration. Two lectures, one drill period of one hour each, one laboratory period of two hours a week. Two hours credit. Second semester.

**ORDNANCE**

**ADVANCED GROUP**

35. **Ammunition.**
Ammunition and explosives, pressure and velocity determinations. Two lectures and one drill period a week. Two hours credit. First semester.
36. Materiel. Small arms, guns, carriages, recoil and special mechanisms, tanks, tractors, self-propelled mounts, and fire control instruments. Two lectures, one two-hour laboratory, and one drill period a week. Two hours credit. Second semester.

37. Organization and Functions of the Ordnance Department. The organization of the Army and the Ordnance Department, a study of the functions of the Field Service and Maintenance Divisions, current ordnance problems and problems in ordnance design. Two lectures and one two-hour laboratory period, and one drill period a week. Two hours credit. First semester.

38. Administration. Military law and Officers Reserve Corps regulations; military history and policy, company administration and supply, property accountability, and industrial mobilization. Two lectures and one two-hour laboratory period, and one drill period a week. Two hours credit. Second semester.

GENERAL

Infantry Drill with Each Course.—Company drill for one hour a week is a required part of each course.

Rifle and Pistol Practice.—All R. O. T. C. students may practice on the indoor and outdoor ranges whenever practicable during scheduled periods. Membership on the R. O. T. C. Rifle or Pistol Teams depends on both excellence in marksmanship and compliance with the rules governing attendance at practice and competitions. Hours of practice to be announced.

SUMMER CAMPS

ADVANCED

Attendance at an advanced camp is required and is a prerequisite to graduation. Transportation, equipment, quarters, rations, and medical attention are furnished by the Government. In addition the student draws pay for the seventh grade (70c a day in 1929). Ample time and facilities are allowed for recreation. All camps are of six weeks' duration and begin about June 20.
Signal Corps—Fort Sheridan, Ill.
Infantry—Fort Sheridan, Ill.
Ordnance—Aberdeen Proving Ground, Md.

65. MINERALOGY AND PETROGRAPHY

Professors Kraus and Hunt; Associate Professor Peck; Assistant Professor Ramsdell; Dr. Slawson.

The Mineralogical Laboratory comprises thirty-six rooms located in the northwest portion of the Natural Science Building.
A suite of five rooms, designed especially for research, is located on the first floor. Three of these rooms have light-tight shutters, and are provided with piers equipped with water, gas, compressed air, and alternating and direct currents. The packing, store, and grinding rooms are also on this floor. The mineral collection, lecture room, model and apparatus rooms, and an office are on the second floor. The laboratories for the courses in general mineralogy, blowpipe methods, and mineral and rock analyses, several offices, and a stock room are on the third floor. On the fourth floor are laboratories for lithology, petrography, crystal measurements, and physical crystallography, a small lecture room, and offices for the staff and advanced students.

The laboratory is well equipped with crystal models, natural crystals, and lecture and working collections of minerals, rocks, and thin sections. There is an excellent equipment of goniometers, polarization microscopes, and other crystallographic-optical instruments necessary for the thorough study of minerals. These instruments are all of the most modern and approved types. The blowpipe and chemical laboratories possess every facility for the qualitative and quantitative determination of minerals and rocks. The equipment of the laboratory is such that special attention can be given to graduate work and special investigation in mineralogy and petrology.

31. Elements of Mineralogy. This includes the elements of crystallography, and the physical and chemical properties, occurrence, uses, and determination of the more common minerals. Two lectures and two hours laboratory a week. Prerequisite: A knowledge of elementary inorganic chemistry. Two hours credit. Each semester.

32. Gems and Gem Materials. Lectures and demonstrations. This course discusses the general properties, occurrence, determination, and history of the various minerals used as gems and gem materials. The various methods of distinction, especially from imitations and synthetic gems, will also be considered. No previous training in mineralogy or the sciences is required, although an elementary knowledge of chemistry and physics is highly desirable. Students who have completed Course 31 may elect Course 32 as Course 34 and receive one hour credit. Two lectures a week. Two hours credit. Second semester.

33. Determinative Mineralogy. Laboratory work. This course is intended for students who have finished Course 31 and wish to become more proficient in the determination of minerals. Five hours laboratory work a week. Two hours credit. Each semester.
35. Elementary Chemical and Optical Mineralogy. Designed primarily for students of pharmacy and chemistry. The first half of the course deals with the common crystal forms and the important commercial minerals. The second half is devoted to the application of the petrographic microscope to the identification of chemical compounds. Two lectures and two hours laboratory work a week. Two hours credit. Second semester.

104. Useful Minerals, Building and Decorative Stones. Designed especially for students of Architecture. Three lectures, and two hours laboratory work a week. The first half of the course is devoted to the physical and chemical properties, uses and determination of the common rock-forming minerals, and of those ores from which the metals commonly used for building purposes are obtained. The second half is devoted to a discussion of the origin, modes of occurrence, description, and uses of the common rocks, with special emphasis upon those used for structural and decorative purposes. Prerequisite: a knowledge of elementary inorganic chemistry. Three hours credit. Second semester.

105. Qualitative Blowpipe Methods. The use of blowpipe reactions upon charcoal and plaster tablets, as well as other chemical methods useful in the determination of minerals. Two lectures and two hours laboratory work a week. Two hours credit. First semester.

107. Lithology. The lectures include, aside from a review of the rock-forming minerals, a discussion of the classification, origin, and methods of determination of the more important rocks. In the laboratory the student is required to determine by means of the macro-physical properties a large number of rock specimens. Two lectures and two hours' laboratory work a week. Prerequisites: Course 31, and Geology 31 or its equivalent. Two hours credit. Second semester.

Summer Session

Courses 31, 33, 105, and 107, or similar courses, will be offered in 1930. For other courses, see Announcement of the Summer Session.

66. MODERN LANGUAGES

The study of a modern foreign language is considered of particular value to the student in the technical school as it serves to broaden his outlook on life by introducing him to a new literature and a new civilization. With such an asset of a cultural and social nature added to his practical training, the student should represent the ideal type of university man possessing a well-
rounded and complete education, beneficial both to himself and to society.

The aim of the instruction in French, German, and Spanish is to help the student to a reading, writing, and speaking knowledge of those languages. The object of the courses of the first two years is to familiarize the student with the forms and the construction of the languages and to furnish him with practice in reading and speaking them.

The object of the courses of reading in scientific literature is to acquaint the student with the terminology and special vocabularies of the various sciences, and thus enable him to consult books and periodicals bearing on his professional work with facility and profit. Many students read, beside the work assigned for the classroom, scientific articles in the numerous foreign periodicals to be found in the Engineering Library. This is of value to the student in the pursuit of much of his advanced work. In some of the more important courses in the College of Engineering a reading knowledge, at least, of one of these languages is required.

Elective courses of two types are offered: (1) advanced courses in the language studied for those who wish to pursue work beyond actual requirements, (2) general courses in foreign literatures for cultural purposes.

For graduation requirements in foreign languages see section 51.

FRENCH

2. Elementary French Continued. Grammar, composition, dictation, conversation; reading of selections from modern authors. Four hours credit. Each semester.

31 (Formerly 3). Intermediate French. Reading of modern French prose (short story, novel, or drama); composition based on a thorough review of grammar; dictation and conversation. Four hours credit. Each semester.

32 (Formerly 4). Outline History of French Literature. Survey of French literature from its origin to modern times; illustrative readings in outstanding works from the seventeenth century to the twentieth. Lectures, discussions, oral and written quizzes. Four hours credit. Each semester.

9e. French Chemical Reading. The object of this course is to familiarize the student with the technical terms used in French literature on chemistry. Equivalent to Chemistry 102. One hour credit. Second semester.
MODERN LANGUAGES

For advanced elective courses consult the Announcement of the College of Literature, Science, and the Arts.

Summer Session

1. Beginners' Course. Six hours credit.

1. Beginners' Course. Four hours credit.

GERMAN

2. Elementary German Continued. Grammar, composition, dictation, conversation; reading of selections from modern authors. Four hours credit. Each semester.

31 (Formerly 3). Intermediate German. Reading of modern German prose (short story, novel, or drama); dictation and conversation; grammar review to suit the needs of the class. Four hours credit. Each semester.

32 (Formerly 4). Intermediate German Continued. Reading of scientific literature and masterpieces of classical and modern writers (drama, novel, story); discussion, conversation, interpretation. Four hours credit. Each semester.

9e. German Chemical Reading. The object of this course is to familiarize the student with the technical terms used in German literature on chemistry. Equivalent to Chemistry 101. Two hours credit. First semester.

For advanced elective courses consult the Announcement of the College of Literature, Science, and the Arts.

Summer Session

Courses 1, 2, and other courses will be offered during the Summer Session of 1930.

SPANISH

2. Elementary Spanish Continued. Grammar, composition, dictation, conversation; reading of selections from modern authors. Four hours credit. Each semester.

31 (Formerly 3). Intermediate Spanish. Reading of modern Spanish prose (short story, novel, or drama); composition based on a thorough review of grammar, dictation and conversation. Four hours credit. Each semester.
32 (Formerly 4). Intermediate Spanish Continued. Reading of modern prose; composition with special emphasis on commercial correspondence. Four hours credit. Each semester.

For advanced elective courses consult the Announcement of the College of Literature, Science, and the Arts.

Summer Session

Courses 1, 2, and other courses will be offered during the Summer Session of 1930.

67. NAVAL AVIATION
(Department of Aeronautical Engineering, College of Engineering)

The Navy Department, in connection with the Naval Aviation Reserve, offers through the University of Michigan a ground school course in aviation open to male students of all Schools and Colleges of the University who are citizens of the United States and who are able to pass a satisfactory physical examination. Instruction is given by members of the Faculty of the University and by officers of the United States Naval Reserve.

Upon successful completion of this course a student is eligible for selection for actual flight training leading to a commission as Ensign in the United States Naval Reserve, or 2nd Lieutenant in the United States Marine Corps Reserve, and to qualification as Naval Aviator.

Flight training will be given in two periods; an elimination course of thirty days at the U. S. Naval Reserve Aviation Base, Great Lake, Ill., and advanced training given at the U. S. Naval Air Station, Pensacola, Fla., for a period of eight months in the same classes with officers and men of the regular Navy. During these periods all expenses are paid with additional pay as a student naval aviator. The syllabus calls for 218 flight hours.

Upon completion of the advanced training, comprising qualifications in more advanced types of airplanes, machine gunnery, bombing, photography, and scouting, the successful candidate is commissioned and designated Naval Aviator.

To those who volunteer for the service a year’s active duty as a commissioned officer with the Aviation Squadrons of the Atlantic and Pacific Fleets is offered.

The course as described below must be elected at the same time and in the same manner as other elective courses in the University.

The course in Naval Aviation comprises ground school instruction in the following subjects: Practical Flying, Aviation Indoctrination, Navigation, Aerology, Theory of Flight, Structure and Rigging of Airplanes, Aviation Engines, Instruments, and Regulations. During the school year it is intended that students
be given an opportunity to take flights in airplanes of the U. S. Navy.

Seniors or graduate students only are eligible for selection for flight training. Juniors may take the course for credit, with the permission of the Dean of the Colleges of Engineering and Architecture. Plane trigonometry, physics, or elementary electricity are prerequisite. To receive credit the course must be taken for the whole year. Two two-hour evening periods a week. Four hours credit (at the rate of two hours credit per semester).

68.

PHILOSOPHY

For full information about the courses in Philosophy and Psychology, see the Announcement of the College of Literature, Science, and the Arts.

69. SHOP PRACTICE

Professor BOSTON; Associate Professor CAMPBELL; Assistant Professor GWIAZDOWSKI; Mr. TELFER, Mr. SPIERS, Mr. GRENNAN, Mr. KNEEBONE, Mr. BLITON, and Mr. PARKER.

The object of the courses in shop practice is to acquaint engineering students with fundamental principles, modern methods, and industrial applications. Each course consists of classroom periods in which texts, notes, lectures, lantern slides, etc., are used, and laboratory periods during which the application of principles and methods are demonstrated. As occasion permits, trips are made to industrial plants to observe the practice which is treated in these courses.

The Engineering Shop Laboratories occupy four floors in the south wing of the East Engineering Building. Classrooms and locker rooms are arranged adjacent to the laboratories. Special care has been taken in the selection and arrangement of equipment to facilitate instructional and research work. A chemical laboratory is provided to aid in the control of foundry operations. An electric freight elevator serves all floors. Electric power is used throughout the laboratories, furnishing good examples of group and individual drives.

The Machine Tool Laboratory, 60 by 130 feet, is on the first floor and has been carefully arranged to demonstrate the two types of machine shop methods, tool room and production. One part of the laboratory contains one or more of each of the principal types of machine tools, such as lathes, planers, grinders, shapers, drilling and milling machines, boring mills, and broaching machines, also many others of more special types, used in tool
rooms. In another part of the laboratory, the machines are arranged to give the student a perspective of the machines, tools, and methods used in the manufacture of articles in production. Machine tools for this purpose are the turret lathe, screw machine, automatic screw machine, punch press, die casting machine, drill presses, and milling machines equipped with jigs and fixtures, automatic gear cutters, etc. A third part of the laboratory is occupied by a grinding room which contains grinding, polishing, and buffing machines and auxiliary equipment. This room is connected with an air cleaning system. Centrally located in the laboratory and under the supervision of an attendant is a well-organized tool crib, 25 by 36 feet, containing a comprehensive equipment of measuring instruments, gages, and small tools for machine and hand use. Adjoining this tool crib and under the same supervision is a room where material for manufacture is stored. The equipment of the laboratory offers favorable opportunity for research work on the subject of forming and cutting metals.

The Instrument Shop on the second floor is equipped for fine instrument work. In this shop, research apparatus for the various departments of the University is constructed and also general service work rendered in the repair of equipment. This work is handled by a permanent staff of machinists and is independent of instruction given to students.

The Woodworking Laboratory, 45 by 60 feet, is located on the second floor. The north side of the laboratory contains the work benches and portable power-tools needed for hand work, together with the tools necessary for pattern making. On the south side, are arranged a variety of woodworking machines, making the laboratory a very complete unit. Adjoining the laboratory on the west side is the pattern and wood storage room.

The Metal Working and Treating Laboratory, 60 by 100 feet, on the third floor, is equipped with forty forges, a power hammer, lathes, shapers, grinders, drilling machines, and work benches. For instruction in heat treating, one electric furnace and five gas-fired furnaces with necessary accessories are installed. The welding equipment consists of an oxy-acetylene welding outfit, electric arc welding and electric resistance welding equipment, a thermit welding outfit, and two brazing tables. A universal testing machine of 50,000 pounds capacity. Shore scleroscope, Rockwell hardness and Brinell hardness testing instruments are provided for instructional and research purposes. Nickel-plating and Parkerizing equipment are available for demonstrations.

The Foundry Laboratory, 60 by 130 feet, on the fourth floor, is divided into the melting, molding, core-making, and cleaning
divisions. The melting equipment consists of an electric arc furnace of 200 pounds capacity, a 32-inch cupola, a 12-inch cupola, and a crucible furnace. Special equipment is available for making castings in metal molds. Six standard types of molding machines are available for general uses. Benches, racks, ovens, and miscellaneous equipment are provided for the making of cores. The cleaning equipment consists of a sand-blast machine, tumbling barrels, and grinding stands. A cyclone air cleaning system is attached to all of these machines. Materials are delivered to the cupola charging floor by an electrically operated elevator. A two-ton electric traveling crane serves the molding floor.

1. Woodwork. Bench, lathe, and simple pattern work. The work in this course may be selected to suit individual requirements. Two three-hour laboratory periods a week. Two hours credit. Each semester.

1d. Shop Practice for Dental Students. This course is designed to develop manual dexterity. The work includes metal cutting and polishing; forming and hardening tools; and the preparation of molds. The resources of the whole department are available for this purpose. One four-hour laboratory period a week. Second semester.

2. Metal Working and Treating. A study of the principles and practice applied to the working and treating of wrought iron and steel. One recitation and one three-hour laboratory period a week. Two hours credit. Each semester.

2a. Advanced Metal Working and Treating. Further work on subjects scheduled in Course 2 may be elected by making arrangements with the instructor.

3. Foundry. A study of the principles and practice applied to cast metals including gray iron castings, malleable iron castings, steel castings, and various types of non-ferrous castings. Two recitations and two three-hour laboratory periods a week. Prerequisite: Course 2. Four hours credit. Each semester.

3a. Advanced Foundry. For those students who are especially interested in the foundry branch of engineering, advanced foundry instruction is offered on special problems. Arrangements are to be made with the instructor.

4. Machine Shop. Studies are made of the following subjects: the cutting of metals—lathe work, milling, drilling, reaming, tapping, broaching, grinding, polishing, and buffing—also gear cutting, jigs, special tools, standards, measuring instruments, gages, manufacturing lay-outs, automatic machines, cutting fluids, die-
casting, punch and die work, spinning, as well as associated subjects, such as, industrial organization, accounting, stock records, standardization, time study, and routings. Two recitations and two three-hour laboratory periods a week. **Prerequisite: Course 2.** Four hours credit. Each semester.

4a. **Advanced Machine Shop Practice.** This course may be elected to suit individual requirements. Special topics incidental to machine shop practice, such as technique of processes, research work, and advanced tool-room work are included. Arrangements are to be made with the instructor.

6. **Pattern Making.** Construction of wood or metal patterns from working drawings. Classroom and laboratory to be arranged. **Prerequisite: Course 1.** Two hours credit. Each semester.

7. **Jig and Fixture Design.** Consists of drawing periods supplemented by assignments which treat of the principles underlying the design, construction, and application of such accessories to manufacture. Drawing periods to be arranged. Two hours credit. Second semester.

8. **Foundry Costs and Organization.** A study of foundry cost methods, foundry records, and standard instructions for foundry operations. Lectures and assignments. **Prerequisite: Course 3.** Two hours credit. Second semester.

10. **Aircraft, Materials of Construction.** (Also Aeronautics 17.) Designed for aeronautical engineering students, to acquaint them with the treatment of fabrics; the forming, glueing, and jointing of wooden parts; and the cutting, punching, bending, riveting, welding, brazing, heat treatment, and testing of steel tubular and duralumin parts and structures. Two three-hour laboratory periods a week. **Prerequisite: Course 2.** Two hours credit. Second semester.

**Summer Session**

Courses 1, 2, 2a, 3, 3a, 4, and 4a, or similar courses, will be given during the Summer Session of 1930.

---

**ENGINEERING RESEARCH**

Professor A. E. WHITE, Director; Mr. SELLEW, Assistant Director; Professor NELSON, Editor of Publications; Mr. HUTCHINGS, Special Representative; Professor WILLARD, Supervisor of Analytical Laboratory; Investigators JOMINY, and PETTYJOHN; Assistant Professor Goon, Assistant to the Director; Assistant Professor WALTON, Assistant to Editor of Publica-
The Department of Engineering Research was established in October, 1920, to afford an official department through which the laboratory facilities of the University, when not being utilized for instructional purposes, could be made available to the civic and technical interests in the State and elsewhere.

The Department does not offer course work to students in the University, but with the research problems brought to the University through the medium of the Department, opportunity is in many cases afforded graduate students to work on special research problems under the technical supervision of members of the faculty or the staff of the Department.

Besides such problems several fellowships are administered through this Department, although the actual technical work is done in the various departments of the College. At present these fellowships are:

- Michigan Gas Association Fellowship
- American Gas Association Fellowship
- Detroit Edison Fellowship in Chemical Engineering
- Timken Roller Bearing Company Fellowship in Physics
- Detroit Steel Products Company Fellowship in Ventilation

The function of the Department is largely administrative, the actual technical direction of the researches in most cases being in the hands of members of the regular faculty.

The facilities available through the Department include the libraries of the University and the engineering and other technical laboratories. The work in the laboratories is conducted by members of the staff connected with those laboratories, thus insuring a maximum of efficiency in their utilization.
71. THE GROUP SYSTEM OF ELECTIVE STUDIES

In July, 1912, there went into effect a complete revision of all the programs in Engineering by which it was made possible for a student in his senior year to have a much wider range of elective work than formerly. The new system provides that of the 140 hours of credit required for graduation, 125 to 131 hours are prescribed and 9 to 15 hours may be elected. These elections may be made from announced groups of study or from other courses approved by the head of the department.

The group system allows the student to receive his instruction in the advanced subjects from a specialist. It also permits a student desiring to take up a fifth year of study to specialize in some particular branch of engineering. A student in any group will be allowed to elect work in the other departments of engineering or in the other colleges or schools of the University, subject to the approval of the head of his department. A student desiring to obtain special scientific knowledge or special business training by building on the fundamental subjects of engineering may be allowed to elect scientific courses or courses in economics or business administration under the direction and approval of the head of his department.

Information regarding the several professional departments of the College of Engineering, facilities for instruction, requirements for graduation, schedules of study, etc., will be found in the following pages.

72. AERONAUTICAL ENGINEERING

Professors Pawlowski and Stalker; Assistant Professor Brown; Mr. Burke.

The work in this Department has been arranged to cover all problems entering into the design and construction of machines that utilize the air as their means of support and transportation. In this connection the two main types are classified in the following groups:
Heavier-than-Air Craft, which comprises a study of the general question of aerodynamics, problems relating to the lift and drag of various types of wing sections, the determination of stresses, and the general design of structure for all parts of an aircraft, and the design of propellers and propelling machinery.

Lighter-than-Air Craft, which includes all studies similar to those mentioned above, but with special reference to this type of structure; together with the principles involved in balloons and dirigibles, and their navigation.

The Courses offered by the Department are arranged to cover the essentials of aerodynamics necessary for the proper understanding of the action of wings, propellers, and problems connected with stability and maneuvering; and form the basis for the application of such studies to the design, construction, and analysis of performance of all types of aircraft.

From its inception the Department of Aeronautical Engineering has realized that the utilization of the air as a means of transportation, the settlement of problems confronting the designer, and the future development of this field must rest upon a thorough foundation of aerodynamic theory. As a preparation for this, and for design purposes, beside the usual mathematics, courses in theory of structures, mechanical engineering, including gas engine design and hydromechanics, also are essential. In the design of aircraft, the student is given a chance to apply such studies, so as to obtain the best solution to any given set of conditions.

The wind tunnel offers facilities for experimental work in all problems relating to this subject, and is available for research work for advanced students.

The Department is in constant touch with the Government and industrial concerns which demand well-trained men in this field. The development of this newest element, in which a large part of high speed transportation must inevitably be carried on in the future, will continue to call for numbers of properly trained engineers, both in the design and research fields.

Aeronautics Laboratory.—The aeronautics laboratory proper comprises a large wind tunnel of the open throat type with double ducts for the return of the air flow. The cross section of the tunnel is an octagon and its minor diameter may be varied from eight feet to five feet. With the large diameter the wind velocity is one hundred miles per hour, and models of 50 inches span can be tested. The laboratory is at present equipped with a wire balance, and another balance incorporating a rigid model support is under development. Facilities for instruction in the testing of model propellers are now provided and a dynamometer
is being constructed to test propellers of as large a diameter as six feet.

Students taking Aeronautical Engineering regularly take work in the electrical, mechanical, strength of materials, and automotive laboratories. Work may also be elected in other special laboratories such as the naval tank.

**Combined Courses** have been arranged with Albion, Battle Creek and Olivet Colleges and the College of the City of Detroit. For detailed information see section 15.

**Advice to Students** of other colleges and universities, with regard to planning their courses before coming to the University, is to be found in section 14.

**Military Science.**—The attention of prospective students in aeronautical engineering is called to the Reserve Officers Training Corps. Students in aeronautical engineering are particularly well qualified to take the work offered in preparation for air service. Those who consider taking Military Science are urged to enroll at the beginning of their course. For further details see section 64.

**CURRICULUM IN AERONAUTICAL ENGINEERING AND REQUIREMENTS FOR GRADUATION**

Candidates for the degree of Bachelor of Science in Engineering, Aeronautical Engineering, are required to complete the curriculum detailed below. For the definition of an hour of credit see section 50.

a) **Preparatory Courses**
   - English 1 and 2 and a course from Group 3 .......... 6 hours
   - Modern Language and Cultural Electives .......... 16 hours
   - Mathematics 3, 4, 33, 34 ..................... 18 hours
   - Physics 45, 46 ................................ 10 hours
   - Chemistry 5E .................................. 5 hours
   - Drawing 1, 2, 3 ................................ 8 hours
   - Shop 2, Metal Working .......................... 2 hours

   Total ........................................ 65 hours

b) **Secondary Courses**
   - Shop 4, Machine Shop ............................ 4 hours
   - Surveying 4, Use of Instruments ................. 2 hours
   - Engineering Mechanics 1, Statics ................. 4 hours
   - E. M. 2, Strength and Elasticity ................ 3 hours
   - E. M. 3, Dynamics .............................. 2 hours
   - E. M. 4, Hydrodynamics ........................ 3 hours
   - C. E. 2, Theory of Structures ................... 3 hours
AERONAUTICAL ENGINEERING

M. E. 2, Elements of Machine Design ............... 3 hours
M. E. 3, Heat Engines .................................. 4 hours
M. E. 5, Thermodynamics ............................... 3 hours
M. E. 6, Theory of Machine Design .................... 4 hours
M. E. 7, Mechanical Laboratory ........................ 2 hours
M. E. 15, Internal Combustion Engines ................. 3 hours
M. E. 32, Automotive Laboratory ........................ 3 hours
E. E. 2, Elec. Apparatus and Circuits .................. 4 hours
Ch. E. 1, Engineering Materials ........................ 3 hours

Total ................................................. 50 hours

c) Technical Courses and Electives
Aero. 1, General Aeronautics ......................... 2 hours
Aero. 2, Theory of Aviation .......................... 2 hours
Aero. 3, Theory of Design and Propellers ............. 2 hours
Aero. 4, 4a, Aeroplane Design ........................ 4 hours
Aero. 5, Aeronautical Laboratory ..................... 1 hour
Aero. 6, Design of Aeronautical Motors ............... 2 hours
Electives ............................................. 12 hours

Total ............................................... 25 hours

Summary:
Preparatory Courses .................................. 65 hours
Secondary Courses ................................... 50 hours
Technical Courses and Electives ..................... 25 hours

Total .............................................. 140 hours

### Courses in Aeronautical Engineering

1. **General Aeronautics.** Lectures and recitations. An introductory course giving the essential principles of aeronautics (balloons, dirigibles, ornithopters, helicopters, aeroplanes, helicopters, and kites), history of flight and description of modern aircraft. Open to all students. Two hours credit. Each semester.

2. **Theory of Aviation.** Lectures and recitations. The course deals with the following: general discussion of modern aerodynamical theories of lift and drag; the results of wind tun-

*For the Modern Language requirement see section 51.
nel and flight experiments, and the performance of airplanes, including stability and balance studies. *Prerequisites:* Courses E. M. 1 and E. M. 3. Two hours credit. Each semester.

3. **Theory and Design of Propellers.** Lectures, recitations, and drawing. Theory of propellers and analysis of propeller performance on the Drzewiecki system; Eiffel’s method of propeller analysis and graphical method of determining propellers for specified conditions; analytical and graphical methods of investigating the strength of propellers and influence of gyrostatic moments in quick terms. The student will design a propeller and analyze the distribution of stresses in the blades. *Must be preceded or accompanied by Course 2.* Two hours credit. First semester.

4. **Aeroplane Design.** Lectures and recitations. This course includes the investigation of the design of the aeroplane from the aerodynamical and structural standpoints. The strength and design of details are discussed and a completed design prepared. *Must be preceded or accompanied by Course 3, and C. E. 2.* Two hours credit. First semester.

4a. **Aeroplane Design.** Continuation of preceding course. Drawing only. Two hours credit. Second semester.

5. **Aerodynamic Laboratory.** An elementary course covering use of instruments, investigation of aerodynamical properties of the various combinations of bodies and aerofoils used in aeroplanes and airships, test of propellers. *Must be preceded or accompanied by Courses 2 and 3, and preceded by M. E. 7.* One hour credit. Second semester.

6. **Design of Aeronautical Motors.** Lectures and drawing. Complementary course to M. E. 15 or M. E. 30, dealing with special features of the aeronautical motors, a more refined method of cam design, analysis of vibration and balancing of motors, critical study of various types of motors, and complete general plans of a motor of a certain type are prepared. *Prerequisite: M. E. 15 or M. E. 30.* Two hours credit. Second semester.

7, 8. **Lighter-than-Air Craft.** Lectures and recitations. This course is concerned with the following: aerostatics, and major aerodynamic and structural design problems of non-rigid, semi-rigid, and rigid aircraft. Two hours credit. Second semester.

10. **Design of Aerodromes and Hangars.** Lectures, recitations, and drawing. Planning and equipment of aerodromes and aero-ports; study of construction of transportable and stationary hangars. General plans of an aerodrome are prepared. *Prerequi-
sites: Courses 2 and 7. Two hours credit. First or second semester if required.

12. Seminary. Reading and reports on selected aerodynamical and aeronautical problems. Open only to graduates and seniors who receive special permission. A reading knowledge of French and German is most desirable. Credit to be arranged.

13. Advanced Design. Continuation of Course 4a, taking up some of the more complex or special problems. Open primarily to graduates. Credit to be arranged.

14. Research. Continuation of Course 5, offering an opportunity for students to pursue advanced experimental and analytical investigations of any problems in connection with aeronautics. The work of the course consists of investigations for securing data on the more difficult problems of aeronautics and mathematical interpretation of the results. Must be preceded by Math. 57 and 58. Open primarily to graduates. A reading knowledge of French and German is desirable. Credit to be arranged.

For information on flying, see Military Science and Tactics, and Naval Aviation.
ASTRONOMY

Professor Curtiss*; Associate Professor Rossiter†; Assistant Professors Rufus, McLaughlin, and Maxwell; Dr. Losh, and Mr. Williams.

The University Observatory is situated at the corner of Ann and Observatory Streets.

Its equipment includes a 37½-inch equatorial reflecting telescope, which is used for stellar spectographic work; a 12½-inch equatorial refractor; a 6-inch meridian circle; a comet seeker; mean and sidereal clocks and chronometers, chronograph, theodolites, sextants, seismographs, computing machines, and measuring engines.

The Observatory Library contains about 3,000 volumes, devoted mainly to technical astronomy. It includes the more important works on theoretical and practical astronomy, many star catalogues, files of the leading astronomical periodicals, and the publications of the more important observatories.

The astronomical laboratory is located on the fifth floor and the roof of Angell Hall. The present equipment of this laboratory includes a 15-inch reflector, a 10-inch refractor, a 3-inch astronomical transit, a horizontal spectrohelioscope, 3 portable refractors, a planetarium, celestial globes, and other smaller instruments. A second astronomical transit is to be added to this equipment in the future.

The Observatory maintains, through the generosity of Mr. Robert P. Lamont, '91E., a branch observing station, called the Lamont-Hussey Observatory, in Bloemfontein, South Africa. The equipment includes a 27-inch refractor and a six-inch visual and photographic telescope. The three observers at Bloemfontein are devoting their time to research in the field of visual double stars.

CURRICULUM IN ASTRONOMY

The first two years' work in any department of engineering constitutes good preparation for a curriculum looking toward the profession of Astronomy.

Candidates for the degree of Bachelor of Science in Engineering (Astronomy) are required to complete the following program of studies:

*Died December 25, 1929.
†Professor Rossiter is on duty as chief astronomer, Lamont-Hussey Observatory of the University of Michigan, Bloemfontein, Orange Free State, South Africa.
a) Preparatory Courses

English I and 2, and a course from Group 3 .......... 6 hours

*Modern Language and Cultural Electives .......... 16 hours

Mathematics 3, 4, 33, 34 ............................... 18 hours

Physics 45, 46 ............................................ 10 hours

Chemistry 5E .................................................. 5 hours

Drawing 1, 2, 3 ............................................. 8 hours

Shop 2 ......................................................... 2 hours

Total .......................................................... 65 hours

b) Secondary and Technical Courses

Engineering Mechanics 1, 3 .......................... 6 hours

Drawing 4, or C. E. 2 ................................. 2 or 3 hours

Geology 31 .................................................... 3 hours

Surveying 1, 2 ............................................. 7 hours

Surveying 5 or Astronomy 154 ....................... 2 hours

Astronomy 31, 32, 33, 101, 151, 152, 201 ............ 18 hours

Geodesy I ..................................................... 3 hours

Mathematics 105, 107, or 145, 146 ................ 5 or 6 hours

Physics 181, 186 ......................................... 8 hours

Psychology 31 ............................................... 3 hours

Total .......................................................... 59 hours

Summary:

Preparatory Courses ..................................... 65 hours

Secondary and Technical Courses ................. 59 hours

Electives ......................................................... 16 hours

Total .......................................................... 140 hours

COURSES IN ASTRONOMY

Courses 31, 32, 33, 103, and 104 are recommended to those who wish to obtain a general knowledge of modern astronomy without entering far into its mathematical details. Courses 35, 101, 102, 154, and 201 are recommended to those who wish to obtain a knowledge of practical astronomy in its applications to engineering and geodesy.

Courses in addition to those mentioned below are listed in the Announcement of the College of Literature, Science, and the Arts. These include advanced work in theoretical astronomy, practical astronomy, and astrophysics. The larger instruments of the Ob-

*Students in this curriculum may satisfy the modern language and cultural requirement in the College of Engineering in the usual way, or they may elect twelve hours each of French and German.
servatory are intended primarily for research, and are available to that end to such students as have assigned problems requiring their use.

31. Descriptive Astronomy. The Solar System. A descriptive course, including the fundamental principles of astronomy, and a presentation of the leading facts concerning the sun, moon, planets, and comets. Three lectures or recitations, and one Observatory exercise. Three hours credit. Each semester.

32. Descriptive Astronomy. Stars and Nebulae. A descriptive course, devoted mainly to stars and nebulae, including the study of the sun as a typical star. Three lectures or recitations, and one Observatory exercise. Three hours credit. Each semester.

33. Observational Astronomy. Constellation studies and telescopic examinations of the heavenly bodies. Selected problems with the celestial globe and equatorial telescope. Laboratory period of three hours. Open to those who have had or are taking Course 31, 32, or 35. One hour credit. Each semester.

35. Practical Astronomy. The elements of spherical and geodetical astronomy, with practical applications. Theory of the determination of time, latitude, longitude, and azimuth. This course is intended primarily for students in Engineering. Recitations and problems. Open to those who have had trigonometry and analytical geometry. Two hours credit. Each semester.

101. Practical Astronomy. Studies in spherical astronomy. Theory of the meridian circle and equatorial and their use in observational work. This course includes observational work with instruments and the reduction of measurements. Recitations, practical problems. Open to those who have had trigonometry and analytical geometry. Three hours credit. Each semester.

102. Navigation. The principles of pilotage, dead reckoning, and nautical astronomy. Lectures based on Bowditch's American Practical Navigator, supplemented by practical problems, chart exercises, and sextant observations. Open to those who have had plane trigonometry. Three hours credit. Second semester.

152. Astrophysics. Studies of methods and results in physical astronomy and especially in stellar spectroscopy. Two recita-
tions and one laboratory period each week. Open to those who have had calculus and possess a general knowledge of astronomy and physics. Three hours credit. Second semester.

201. **Theoretical Astronomy.** The elements of celestial mechanics, and the determination of parabolic and elliptic orbits of comets and planets. *Prerequisite:* calculus. Three hours credit. First semester.

**Summer Session**

Courses 31, 32, 33, 101, 103, 151, 152, and 207, or similar courses, will be given during the Summer Session of 1930.

74. **CHEMICAL ENGINEERING**

Professors A. H. White, A. E. White, Badger, and Brier; Associate Professors Uptegrove, Wood, Brown, and Baker; Assistant Professors McCabe, Pettyjohn, and Thomassen; Mr. Selheimer, and Mr. McCready.

The chemical engineer finds his primary work in the design or operation of plants in which materials undergo chemical as well as physical changes. In our complex industries there must be specialization, and some chemical engineers become experts in design of equipment, some in the operation of particular manufacturing processes, and some in the development of processes from the laboratory to the manufacturing scale. The chemical engineer's work must be based on a thorough knowledge of chemistry but he is not a laboratory chemist. He must apply mathematics and physics in almost the same degree that he does chemistry. His relation to the chemist is very similar to that which the electrical engineer bears to the physicist. As is the case with all engineers, the mature chemical engineer may become a business executive, utilizing his scientific knowledge and manufacturing experience in directing industrial enterprises.

The activities of the chemical engineer do cover a broad field. He finds his work, not only in those industries usually thought of as purely chemical, such as the manufacture of acids, alkalis, and salts; but in such industries as the manufacture of sugar, paper, leather, rubber, soap, fuels, petroleum products, paints and varnishes, cement, plaster, glue, food products, dyes, textiles, and many others. The metallurgist and the ceramist are chemical engineers with specific training for their particular work.
The work of the chemical engineer is often thought of in connection with what are usually called “unit operations.” These are such operations as heating, evaporating, filtering, distilling, crushing, extracting, drying, etc., as carried out on the commercial scale. Any manufacturing process with which the chemical engineer deals is made up of a sequence of such operations. His knowledge of these unit operations is one characteristic which distinguishes him from the chemist, and his understanding of what is actually taking place in a manufacturing process differentiates him from the mechanical engineer.

The field is so broad that more or less definite subdivisions have arisen. Some of these are: metallurgical engineering, industrial engineering, and general chemical engineering.

Metallurgical Engineering embraces the extraction of metals from their ores, the melting, refining, alloying and casting, fabrication and heat treatment of metals, and their utilization in the various industries. The metallurgical engineer finds his field of endeavor not only in the industries involved directly in the production of metals and metal products but to an ever increasing extent in the industries utilizing and dependent for their existence on metals and metal products. No better example is to be found than that offered by the automotive industry, where he is concerned primarily with the heat treatment and use of metals, and where he is recognized as an important member of the organization. In the metallurgical industries proper he is concerned with the quality and general improvement of both product and process. Constantly diminishing natural resources and the ever increasing demand for new alloys of superior qualities offer unlimited opportunities for research in both extractive metallurgy and the development of new products.

Industrial Engineering in the chemical field relates particularly to the economic side of processes, cost accounting and control, administration of manufacturing organizations, and direction of sales effort in the field of chemical engineering equipment.

General Chemical Engineering may be subdivided into many other special branches of engineering and such terms as Gas and Combustion Engineering, Ceramic Engineering, Petroleum Engineering, Electro-chemical Engineering, and others are not unfamiliar.

At the University of Michigan, pronounced distinction is not made in the various fields of Chemical Engineering and all instruction is given under the administration of the Department of Chemical Engineering. The first two years of undergraduate work are devoted largely to acquisition of fundamental subjects as tools required for an understanding of the more specialized subjects.
In these years the student should become familiar with mechanical drawing, mathematics, physics, and chemistry, and begin his work in chemical engineering. He also should acquire some proficiency in the use of the English language, and it is advisable that he obtain a reading knowledge of German, so that there will be available to him valuable publications appearing in the German chemical literature.

In the last two years, attention is divided between studies in Chemical Engineering, advanced work in chemistry, and the fundamentals of other pertinent engineering subjects, such as engineering mechanics, machine design, heat engines, and electrical machines and circuits. An introductory knowledge of economics is obtained and elective subjects provide opportunity for a limited amount of study in such subjects as history, philosophy, and political science.

The work in Chemical Engineering subjects is designed to give the student as broad a foundation as possible, avoiding marked specialization and yet carrying his training in one direction sufficiently far so that upon graduation he may be immediately useful to some organization. Our chemical engineers, even on graduation from a four-year course, often accept positions where they become the sole chemical or metallurgical engineer in the organization, and these men must consequently be fitted to accept and carry creditably such responsibility.

The required work in Chemical Engineering includes courses in engineering materials, fuels and combustion, heat treatment and properties of metals, inorganic and organic chemical technology, theory of Chemical Engineering, and an introduction to research work. This research work may be in any field chosen by the student, and, taken with other elective work, offers opportunity for moderate specialization.

GRADUATE WORK

The mere fact that the chemical engineer must have considerable attainments in the important fields of chemistry, physics, and mathematics, as well as in Chemical Engineering, indicates the need of a course of more than four years. The formative state of Chemical Engineering and its rapid development, which is certain to continue for many years, makes it important that a young man entering the profession be equipped not only to keep abreast of its progress, but also to do his part in advancing his chosen subject during his active professional life. This is definitely recognized by many of the larger corporations, who prefer men with a master's degree to one with a bachelor's degree on the ground that the man with post-graduate training advances faster and farther than an equally able man without it. They recognize this, not only by being more willing to employ men with advanced degrees,
but by paying higher salaries to such men. A notable development of the past five years has been the call for men with the Ph.D. degree. The demand for these men has not only been greater than the supply, but the salaries and opportunities offered have been very attractive.

The laboratories completed in 1923 provide unsurpassed facilities for the study of processes and apparatus. Generous provision in the way of private laboratories has been made to meet the needs of the advanced student.

Forty-two graduate students are making Chemical Engineering their major subject in 1929-1930. Twenty of them are candidates for the doctorate.

**FACILITIES FOR INSTRUCTION**

Excellent facilities are available for theoretical and laboratory studies of the various branches of chemical engineering.

**The Chemical Engineering Library** is shelved with other departmental libraries on the third floor of the East Engineering Building. The library is 33 by 60 feet and has shelves for 15,000 books and seats for 80 readers. Some of the most important journals of pure chemistry are duplicated in this library, and there is a rich collection of journals dealing with industrial chemistry and chemical engineering. The total number of journals currently taken by the Department of Chemical Engineering is 106, and most of them are represented by complete sets. In addition to 6,000 books dealing distinctly with Chemical Engineering, there are many others dealing with more general engineering lines.

**The General Chemical Engineering Laboratory** is devoted primarily to equipment for studying the fundamental elements of Chemical Engineering and has facilities for the following unit processes.

**Evaporation.**—The evaporator laboratory occupies a space 26 by 69 feet extending from the basement through the first floor. The principal equipment is a set of evaporators and accessories which are the gift of the Swenson Evaporator Company of Harvey, Illinois. It is the most complete and extensive equipment of its kind in the country. The evaporators include a standard vertical tube unit, a standard horizontal tube unit, a forced circulation unit, and a special Yaryan evaporator fitted with glass tubes. Each of the three evaporators first mentioned has a maximum evaporation capacity of 4,000 pounds of water per hour. Each is completely equipped with accessories for weighing and controlling feed, removing crystals, and measuring condensate; and each has the greatest possible flexibility to permit
adaptation to process development. Other special evaporators for research purposes are available or are constructed as needed.

**DISTILLATION.**—Facilities for the study of batch and continuous distillation, and of dephlegmation, are available. The equipment includes a 250-gallon electrically-heated still provided with a 20-foot 10-inch packed column, and a bubbler-cap column of the same size. Either column may be operated continuously or as an apparatus of batch type. Suitable condensing, metering, and instrument equipment is available. A 4-inch column and 30-gallon still fitted for continuous distillation and several smaller stills and columns complete the equipment of this division of the laboratory. All of the apparatus is designed with a view to studying the fundamental principles of fractional distillation and fractional condensation.

**GAS ABSORPTION.**—An absorption column that can be filled with various types of tower packing is available.

**FILTRATION.**—The present equipment consists of a 24-inch washing plate-and-frame press, with an assortment of special frames. There is also a deLaval centrifugal clarifier and filter; and a 10-inch Weston centrifuge.

**CRYSTALLIZATION.**—For this work there is a special 30-foot single deck Swenson-Walker continuous crystallizer with dewatering attachment, a vacuum crystallizer with a jet ejector for high vacuums, a special vertical batch crystallizer, and a smaller continuous unit made of glass.

**STIRRING AND MIXING.**—One of the laboratory's tanks is equipped with paddle stirrers and with devices for studying agitation. Facilities are also available for the study of propeller stirrers.

**GENERAL.**—In addition to special equipment of the types enumerated the laboratory is well equipped with storage, reaction, and weighing tanks, pumps, blowers, motors, scales, condensers, digestors, autoclaves, and all necessary accessories. Soft water may be obtained from two Zeolite water softeners and a supply of condensed water nearly as pure as distilled water is also on hand. Additions will be made to the equipment of the laboratory as these become necessary or desirable. The aim at all times will be to provide facilities for fundamental investigations rather than to equip a museum of chemical machinery.

**Gas, Fuel and Combustion Laboratories.**—In this group are included laboratories for general class work in the analysis and calorimetry of industrial gases and fuels, and special testing and
research laboratories for petroleum products, motor fuels, combustion, furnaces and gas manufacture.

The subject of gas manufacture and utilization has been given special attention in the department for over twenty years. No prescribed curriculum has ever been required and it is not felt that a special degree need be given. The undergraduate program in Chemical Engineering gives the necessary fundamental courses and the options in the senior year provide room for some special courses. Those desiring to specialize in Gas Engineering should, preferably, continue as graduate students, and choose subjects in other engineering branches as well as Chemical Engineering.

It is worthy of mention that the American Gas Association has delegated an important portion of its research program to the University, and that the Michigan Gas Association has greatly extended its research program and employed Professor E. S. Pettijohn as an investigator to make his headquarters at the University and carry on his research at that location or in various plants as the need arises. Students in Gas Engineering have unusual opportunities to assist in plant tests.

The Gas and Fuel Laboratories occupy three large rooms on the fourth floor of the north wing. They contain apparatus for the analysis of flue and fuel gases; calorimeters for gas, liquid and solid fuels; and equipment for testing boiler water, lubricants and fuels.

The Petroleum Laboratory has facilities for study of motor fuels and other petroleum products. These are supplemented by the equipment available in the general chemical engineering laboratory, the fuel research laboratory, and in the automobile engineering laboratory.

The Fuel Research Laboratory is especially equipped to study the various factors involved in the utilization of motor fuel. Two electric absorption dynamometers and typical automobile engines are available for making engine performance tests, and a special high compressing engine for making anti-knock tests. The laboratory is also supplied with ammonia refrigeration for conducting tests at low temperatures. Special columns for fractional distillation of fuels and special equipment for measuring volatility are available in addition to the standard equipment.

The Combustion Laboratories have special facilities for research and testing in the field of gaseous explosions, particularly the explosion of hydrocarbon air mixtures in a closed vessel as occurs in internal combustion engines. These are supplemented by equipment in the fuel research and automotive laboratories.
THE FURNACE LABORATORY contains furnaces equipped for making heat balances, and for determining the properties of furnace materials and the laws of heat transfer and gas flow as applied to furnaces.

THE GAS ENGINEERING LABORATORY contains furnaces for manufacture of gas on a small scale and for measuring and testing the finished products. This laboratory is largely devoted to the research work of the Michigan Gas Association.

Metallurgical Laboratories.—The metallurgical laboratories are located on the fourth floor of the East Engineering Building, adjacent to the Foundry and Metal Working and Treating Laboratory of the Department of Engineering Shops, and the Gas and Fuel Laboratories of the Department of Chemical Engineering, so that these facilities are also available. Equipment for heat treating and melting is provided in a large furnace room equipped with standard electric and gas furnaces. Facilities are provided for electro-metallurgical work and experimental electric furnace work in this room. Power is furnished through three 50 k. w. transformers.

For instruction in metallography facilities are provided in the way of a large grinding and polishing room, a microscope and camera room, and well equipped dark rooms. A smaller room fully equipped with polishing and microscopic equipment, and special camera and dark rooms, are available for graduate students.

For testing physical properties of metals a 60,000 lb. Olsen testing machine is equipped for studies at elevated temperatures. Special instruments such as the Brinell Hardness machine, Shore Scleroscope, Rockwell Hardness Tester, Lewis Upton Toughness machine, Izod Impact and others are available. General physical testing equipment is available in the Engineering Mechanics Laboratory.

In the PYROMETRY LABORATORY unusual facilities are provided. The equipment includes several types of millivoltmeters, indicating and recording potentiometers, a transformation point apparatus, optical and radiation pyrometers, various types of thermocouples, and ample facilities for calibrating and checking pyrometric apparatus. The arrangement and equipment of the laboratory are all aimed to supply the student with information which will enable him to take charge of the installation and control of commercial pyrometric and temperature control systems.

THE X-RAY LABORATORY has a thoroughly modern equipment including a transformer of capacity up to 280,000 volts for the radiography of metals and another smaller X-ray outfit which is used for researches on crystal structure, grain size, inner strains,
and orientation of crystals with special reference to engineering materials.

The Technology Laboratories.—This group consists of a number of small laboratories, each equipped with facilities especially adaptable for study and research on the problems arising in the respective industries.

The Cement Laboratory is equipped with a small rotary kiln and accessory apparatus for burning Portland cement under controlled conditions and for testing the properties of cements.

The Ceramics Laboratories consist of a kiln room, preparation room and laboratory. The kiln room is equipped with oil and gas fired recuperative kilns for pottery, high temperature work, and for testing the burning properties of clays and refractory products. The preparation room includes a dry pan for fine grinding of shales and hard clays, two mixers, a pug mill and extruding machine, glass topped tables, and other equipment used in preparing clays for burning. The laboratory is supplied with a Fairbanks testing machine, a volumeter, and means for analyzing and testing the raw and burned clay, and foundry sands.

The Electrochemical Laboratory provides research facilities for electrochemical work. Equipment for the study of electro-thermal and high temperature electrolytic processes are also available as part of the facilities of the metallurgical laboratories.

The Paint and Varnish Laboratory provides facilities for the study of the manufacture and application of paints, varnishes, nitrocellulose lacquers, enamels and other finishing materials. In addition to regular laboratory facilities the equipment includes grinding apparatus, washed air drying kiln, oven for baking japans and varnishes at high temperatures, as well as spray gun equipment for the application of all kinds of finishing materials. A quartz mercury vapor lamp furnishes ultra-violet light which is used as an accelerated weathering test for paint, varnish, and lacquer films. Additional facilities are also available in the general Chemical Engineering laboratories.

General Laboratories.—Undergraduates whose work does not place them in one of the special laboratories have space assigned to them in one of two large laboratories which are equipped with the usual facilities of laboratory tables, water, compressed air, direct, alternating and storage battery current, analytical balances, and tables for study and computation of results.

Graduate students working on special problems have assigned to them individual graduate laboratories which are equipped with general laboratory facilities.
Visits of Inspection.—The educational value of visits of inspection is well recognized and inspection trips are regularly made in connection with the various courses in chemical engineering. The wonderful industrial development of the neighboring cities of Detroit and Toledo as well as other points in Michigan within easy reach of Ann Arbor allows a varied range of industries to be visited at small expense. Week-end trips are frequent. The opportunities are so abundant that the list varies from year to year.

Summer Employment.—Each student is urged to obtain employment in a factory for at least one summer, in order that he may acquire the viewpoint of the worker in an industrial organization. If he may also acquire professional knowledge, so much the better. The manufacturers of Michigan co-operate in this movement, and, except in time of severe business depression, positions are usually available. At least one summer’s work in an approved plant is required in the five-year program in Chemical and Industrial Engineering.

Co-operative Courses.—The Detroit City Gas Company and The Consumers Power Company join with the University in a co-operative course which permits selected students to obtain fourteen months of practical experience in a course which requires five years for its completion.

Combined Courses have been arranged with Albion, Battle Creek, and Olivet Colleges and the College of the City of Detroit. For detailed information see section 15.

Advice to Students of other colleges and universities, with regard to planning their courses before coming to the University, is to be found in section 14. Prospective students of Chemical Engineering are strongly urged to select German as the language to be studied, and to avoid specialization along the lines of Chemistry and Chemical Engineering in their preparatory work. Students in doubt of elections to be made in the first three years' work are cordially invited to correspond with the Department of Chemical Engineering.

Reserve Officers Training Corps.—The attention of prospective students in Chemical Engineering is called to the Reserve Officers Training Corps. Students in Chemical Engineering are particularly well qualified to take the work offered in the Ordnance Unit. Those who consider taking Military Science are urged to enroll at the beginning of their course. For further details see section 64.

Student Branch, American Institute of Chemical Engineers. A student branch of this organization was established in 1922 and
CHEMICAL ENGINEERING

holds monthly meetings for discussion of topics of professional interest. It has a convenient and pleasant clubroom adjoining the seminar room in the East Engineering Building.

CURRICULUM IN CHEMICAL ENGINEERING AND REQUIREMENTS FOR GRADUATION

Candidates for the degree of Bachelor of Science in Engineering, Chemical Engineering, are required to complete the curriculum detailed below. For the definition of an hour of credit see section 50.

Programs, embodying certain required courses, have been established for the four-year course in Chemical Engineering and the five-year course in Chemical and Industrial Engineering. Both of these programs provide some elective courses. The only limitation placed on these elections is that these courses shall be so chosen as to make a logically arranged curriculum.

Outline of Required Courses.
(1) Preparatory Courses.
   English 1 and 2, and a course from Group 3 6 hours
   Modern Language and Cultural Electives ........ 16 hours
   Mathematics 3, 4, 33, 38 ....................16 hours
   Physics 45, 46 .............................. 10 hours
   Chemistry 5E, 17 ............................ 10 hours
   Drawing 1, 2, 3 ............................. 8 hours
   Shop 2, Metal Working and Treating .......... 2 hours

         Total ................................... 68 hours

(2) Secondary and Technical Courses.
   Chemistry 41, Theoretical Chemistry ........... 3 hours
   Chemistry 57, Quantitative Analysis ........... 5 hours
   Chemistry 67, Organic Chemistry ............... 5 hours
   Chemistry 69, Organic Chemistry ............... 5 hours
   Economics .................................... 3 hours
   Eng. Mech. 1, Statics ........................ 4 hours
   Eng. Mech. 2, Strength and Elasticity, or
   Eng. Mech. 6, Strength of Materials ............ 3 hours
   Mech. Eng. 2, Elements of Machine Design ....... 3 hours
   Mech. Eng. 3, Heat Engines ..................... 4 hours
   Elec. Eng. 2a, Elec. App. and Circ. ............ 4 hours
   Chem. Eng. 1, Engineering Materials .......... 3 hours
   Chem. Eng. 2, Technology of Fuels ............. 3 hours
   Chem. Eng. 3, Metallurgy ....................... 3 hours
   Chem. Eng. 4, Inorganic Technology ............. 2 hours
   Chem. Eng. 5, Organic Technology .............. 4 hours
   Chem. Eng. 9, Unit Processes ................... 3 hours
COLLEGE OF ENGINEERING

Chem. Eng. 12, Special Problems ................. 5 hours
Chem. Eng. 29, Unit Processes Laboratory .... 2 hours

Total ........................................... 64 hours

Summary:
Preparatory Courses ............................ 68 hours
Secondary and Technical Courses .............. 64 hours
Electives ...................................... 8 hours

Total required for the B.S.E. degree....... 140 hours

Students in Chemical Engineering who wish to become candidates also in Mathematics are permitted to substitute for Astronomy 35, Eng. Mech. 3 and 4, Surveying I and Civil Eng. 2, such other courses as may be approved by the Department of Mathematics.

#### FIVE-YEAR PROGRAM IN CHEMICAL AND INDUSTRIAL ENGINEERING

1. English                                    | 6     |
2. Modern Language or Cultural Electives      | 16    |
3. Mathematics                                | 16    |
4. Physics                                    | 10    |
5. Chemistry                                  | 28 or 22† |
6. Drawing and Descriptive Geometry           | 8     |
7. Shop Work                                  | 2 or 5† |
8. Engineering Mechanics                      | 7 or 8† |
9. Mechanical Engineering                     | 7     |
10. Chemical Engineering                      | 20 or 22† |
11. Electrical Engineering                    | 4     |
12. Economics and Business Administration     | 36    |
13. Summer Plant Work 8 weeks                 | 1     |
14. Electives                                 | 15    |

Total required for degree of Bachelor of Science in Engineering (Chemical and Industrial Engineering) 176

†Options for students in Metallurgy who substitute Chem. 63 for Chem. 67, and Chem. Eng. 6 or 7, Shop 3, and Eng. Mech. 2a for Chem. 69.
The first-year work in the five-year program is the same as in the four-year program.

### CO-OPERATIVE PROGRAM IN GAS ENGINEERING

The Detroit City Gas Company and the Consumers Power Company have joined with the College of Engineering to maintain a co-operative program for students interested in gas engineering. This program will require for its completion four years and ten months, of which eight semesters and one summer session will be spent at the University. There will be one preliminary employment period of eight weeks in the summer following the freshman year and two employment periods of seven months each, the first starting at the end of the second year and the second in the middle of the fourth year. There will be either one or two vacation periods of two weeks in each summer. Students in the Engineering College will be given an opportunity to learn details of the co-operative program at some time during the freshman year. Those who become interested and who are accepted will be employed by one of the companies for a preliminary period of eight weeks during the following summer. At the end of this preliminary period, students who have made a satisfactory record and are still interested, may be formally enrolled for the co-operative program. A student thus enrolled will continue his second year of study in the Department of Chemical Engineering without interruption, and will be employed at the end of that period, by the company with which he has established relations, for a practice period which will continue for seven months, commencing July 1 and ending February 1. The student will then return to the University and remain in residence for twelve months, studying for two semesters and a summer school. On February 1, he will be re-employed by the gas company for a second practice period of seven months lasting until September 1. He will then return to the University for two semesters of study and should normally graduate in the following June.

The companies agree to give the students entering upon this work a somewhat varied employment which will put them in direct contact with various aspects of gas manufacturing, distribution and accounting, and to pay them at the prevailing rate paid
other workmen for the same type of work, but not less than fifty cents per hour. The company will retain the same rights to transfer, discharge, or alter the rate of pay of the student employees that it has over its regular employees.

COURSES IN CHEMICAL ENGINEERING

1. **Engineering Materials.** An elementary study of the manufacture and properties of the ferrous and non-ferrous alloys, cements, clay products, protective coatings, fuels and water softening. Two lectures and two recitations. *Prerequisites: Chem. 5; and Shop 2 (except for architects).* Three hours credit. Each semester.

2. **Fuels and Furnaces.** A study of the preparation, combustion, and utilization of fuels; including temperature measurement, analysis of gases and fuels, determination of heating values, and furnace efficiencies, the computation of heat balances, maximum temperatures, and relative costs of heating. Three lectures or recitations and one four-hour laboratory period. *Prerequisites: Ch.E. 1 and Phys. 46.* Three hours credit. Each semester.

3. **Structure and Properties of Metals.** A microscopic study of the structure of metals as affected by composition and by thermal and mechanical treatment; the relation of these to the physical properties of metals; consideration of the factors that determine or limit the uses of metals and common alloys. Two lectures, one recitation, and one three-hour laboratory period. *Prerequisites: Ch.E. 1 and Phys. 46.* Three hours credit. Each semester.

4. **Chemical Technology of the Inorganic Industries.** A descriptive study of the processes and manufacturing methods used in the more important industries based on inorganic chemical technology. Two recitations. *Prerequisites: Ch.E. 2 and 9, Chem. 41, and Phys. 46.* Two hours credit. Each semester.

5. **Chemical Technology of the Organic Industries.** A descriptive study of the processes and manufacturing methods used in the more important industries based on organic chemical technology. Three lectures and two recitations. *Prerequisites: Ch.E. 2 and 9, Chem. 41 and 67; preceded or accompanied by Chem. 69.* Four hours credit. Each semester.

6. **Metallurgy of Iron and Steel.** A critical study of the metallurgy of the ferrous metals; raw materials, the production of pig iron; the manufacture of steel, wrought iron, cast iron and malleable iron. Two lectures and one recitation. *Prerequisites:
Ch.E. 2 and 3, or Ch.E. 1 and M.E. 3. Two hours credit. First semester.

7. Non-Ferrous Metallurgy. A course in the metallurgy of copper, zinc, lead, tin, nickel, and aluminum, covering extractive processes, fabrication, production, and properties of alloys. Two lectures and one recitation. Prerequisites: Ch.E. 2 and 3, or Ch.E. 1 and M.E. 3. Two hours credit. Second semester.

8. Advanced Physical Metallurgy. An advanced study of the thermal, mechanical, and magnetic properties, and the macroscopic and microscopic structures of metals. One lecture, one laboratory period, reports, and discussions. Prerequisites: Ch.E. 3, and Chem. 41. Two hours credit. First semester.

9. Unit Processes. An elementary discussion of the theory of the unit processes of chemical engineering and of typical equipment for carrying out these processes. Two lectures and two recitations. Prerequisites: Ch.E. 1 and Phys. 46; preceded or accompanied by Chem. 41. Three hours credit. Each semester.

10. The Utilization of Fuels. A course designed especially for Mechanical Engineering students, covering in a limited way the material offered in Ch.E. 2. Laboratory work. Prerequisites: Ch.E. 1 and Phys. 45; accompanied by M.E. 7. Not open to students in Chemical Engineering. One hour credit. Each semester.

11. Chemical Engineering Thermodynamics. A study of the application of the principles of the three fundamental laws of energy to chemical engineering processes. Two lectures and two recitations. Open to graduates and to seniors who receive special permission. Prerequisites: Ch.E. 2, Chem. 41, and Math. 4 or 4a. Three hours credit. First semester.

12. Special Problems. The purpose of this course is to train the student in methods of independent research. Each student is, after consultation, assigned a subject connected with some manufacturing process which he is to study intensively both in the library and laboratory. Wide latitude is allowed in the choice of a subject, and the student is, so far as possible, urged to select one that interests him most. Laboratory work. Prerequisites: Ch.E. 4 and such other courses as are essential to a knowledge of the subject selected. Three to eight hours credit. Each semester.

14. Crushing, Classification, Calcination, and Conveying. An advanced study of the fundamental theory of these processes and of the equipment for their operation. Lectures and recitations. **Prerequisites:** Ch.E. 3 and 9. Two hours credit. First semester.

15. Drying, Distillation, Extraction, and Gas Absorption. An advanced study of the fundamental theory of these processes and of the equipment for their operation. Lectures and recitations. **Prerequisites:** Ch.E. 4 and 9. Two hours credit. Second semester.

17. Furnace Design and Construction. A study and application of the principles of furnace design; the properties of refractory materials; and their use in furnace construction. One lecture, one recitation, and one laboratory period. **Prerequisites:** Ch.E. 2 and 9, or M.E. 5. Three hours credit. Second semester.

18. Metallography of the Non-Ferrous Metals. An advanced study of the microscopic structure of the common non-ferrous metals and alloys, and of the effect of heat treatment, mechanical work, and composition on their structure and properties. One lecture and one laboratory period. **Prerequisites:** Ch.E. 3 and Chem. 41. Two hours credit. Second semester.

19. Pyrometry and Furnace Control. A study of the theory, construction, calibration, and use of commercial pyrometers, their application and limitations. One lecture and one laboratory period. **Prerequisites:** Ch.E. 2, and Phys. 46. Two hours credit. Second semester.

20. Summer Work in Factories. Credit is given for a report on some phase of work in a factory. Application must be made for registration in this course and the nature of the problem must be approved before entering upon the work. One hour credit.

21. Special Problems. A continuation of Course 12. Laboratory work. **Open to graduates, and to seniors who receive special permission.** Three to eight hours credit. Each semester.

22. Applied Thermodynamics. An advanced analytical study of chemical engineering processes from the standpoint of quantitative thermodynamics and physical chemistry. A continuation of Course 11. Two lectures and one recitation. Two hours credit. Second semester.
23. **Design of Chemical Plants.** A simple chemical process is selected, and the student proceeds to play the steps in the process and select the type of apparatus for each. Conferences. **Prerequisites:** Ch.E. 13; and preceded or accompanied by Ch.E. 14 and 15, and a course in Machine Design. Three hours credit. Second semester.

24. **Testing Petroleum Products.** Laboratory work. **Prerequisite:** Ch.E. 2. One hour credit. Second semester.

26. **Advanced Ferrous Metallurgy.** A study of the constitution of irons and steels and the effect on their properties of composition, heat treatment, and mechanical work. Lectures and recitations. **Prerequisites:** Ch.E. 3 and 8. Two hours credit. Second semester.

27. **Design of Chemical Machinery.** The student selects some piece of chemical machinery and makes a complete set of drawings that would be required for its actual construction. Conferences and drafting. **Prerequisites:** Ch.E. 9 and a course in Machine Design. Two hours credit. Each semester.

28. **Heat and Material Balances.** Problems illustrating the application of the method of heat and material balances to chemical and manufacturing processes. Two recitations. **Prerequisite:** Ch.E. 4. Two hours credit. First semester.

29. **Chemical Engineering Laboratory.** A laboratory study of the unit processes of chemical engineering, comprising a series of performance tests on various types of chemical engineering equipment. One recitation and one four-hour laboratory period. **Must be preceded or accompanied by Ch.E. 9.** Two hours credit. Each semester.

30. **Seminar in Metallurgy.** Reading and reports on metallurgical subjects. **Open to graduates, and to seniors who receive permission.** Two hours credit. Each semester.

32. **Explosives and Pyrotechnics.** A study of the processes used in the manufacture of commercial and military explosives and pyrotechnic materials; their properties and uses. Lectures and recitations. **Prerequisite:** Ch.E. 5. Four hours credit. Second semester.

33. **Seminar in Heat Transfer.** Conferences and problems in heat transfer. **Open to graduates, and to seniors who receive special permission.** Two hours credit. Second semester.

34. **Petroleum Refinery Engineering.** A study of the processes and apparatus used in the manufacture of petroleum prod-
ucts and natural gasoline. Among the subjects treated are distillation, cracking, chemical treatment, heat transfer, and fluid flow, as these are concerned with the operations in the petroleum refinery and natural gasoline plant. Lectures and recitations. Prerequisites: Ch.E. 5 and 9. Two hours credit. First semester.

35. Motor Fuel Utilization Seminar. A discussion of engine performance as dependent upon motor fuel characteristics. Open to graduate students who have completed Course II or are actively engaged in research in this field. Two hours credit. First semester.

36. Advanced Chemical Engineering Calculations. A problem course illustrating the application of chemical engineering theory to industrial calculations. Problems involving economic balance in engineering design will be emphasized. Conferences and group calculations. Prerequisites: Ch.E. 11, 13, and 15. Three hours credit. Second semester.

37. X-Ray Structures and Their Application to Engineering Materials. Conferences and assigned work. Prerequisites: Advanced mathematics and physics as well as the necessary courses in Chemical Engineering. Three hours credit. First semester.

41. Advanced Ferrous Metallurgy. Research work on the structures and properties of iron and steel. Laboratory work and conferences. Open to graduates, and to seniors who receive special permission. Three to eight hours credit. Each semester.

42. Hydraulic Cements. Research work on the properties of hydraulic cements as influenced by chemical composition and temperature of burning; also studies of constancy of volume and permanence of concrete structures. Laboratory work and conferences. Open to graduates, and to seniors who receive special permission. Three to eight hours credit. Each semester.

43. Evaporation. Research work on the design of evaporators and on problems connected with handling of liquids on the commercial scale. Laboratory work and conferences. Open to graduates, and to seniors who receive special permission. Three to eight hours credit. Each semester.

44. Gas. Research relating to the manufacture, properties, and uses of coal gas, water gas, oil gas, and producer gas. Laboratory work and conferences. Open to graduates, and to seniors who receive special permission. Three to eight hours credit. Each semester.
45. Paint, Varnish, and Pyroxylin Lacquers. Research work on problems connected with the manufacture, properties, and uses of paints, varnish, and pyroxylin lacquers. Laboratory work and conferences. Open to graduates, and to seniors who receive special permission. Three to eight hours credit. Each semester.

46. Advanced Electrochemistry. Research relating to electrodeposition and electrochemical processes. Laboratory work and conferences. Open to graduates, and to seniors who receive special permission. Three to eight hours credit. Each semester.

47. Advanced Non-Ferrous Metallurgy. Research work on structures and properties of non-ferrous metals and alloys. Laboratory work and conferences. Open to graduates, and to seniors who receive special permission. Three to eight hours credit. Each semester.

48. Petroleum and Motor Fuels. Research work on problems connected with the production and utilization of petroleum products. Laboratory work and conferences. Open to graduates, and to seniors who receive special permission. Three to eight hours credit. Each semester.

50. Distillation. Research work on the theory, design, and performance of distillation equipment. Laboratory work and conferences. Open to graduates, and to seniors who receive special permission. Three to eight hours credit. Each semester.

51. Paper Manufacture. Research work connected with the properties of paper pulp and paper making materials. Laboratory work and conferences. Open to graduates, and to seniors who receive special permission. Five to eight hours credit. Each semester.

52. Refractories and Furnace Design. Research work on the thermal and physical properties of refractory materials, combustion, and heat transfer at high temperatures. Laboratory work and conferences. Prerequisite: Open to graduates, and to seniors who receive special permission. Three to eight hours credit. Each semester.

53. Crystallization. Research work on the theory and practice of industrial crystallization. Laboratory work and conferences. Open to graduates, and to seniors who receive special permission. Five to eight hours credit. Each semester.

54. X-Ray Studies. Research work in the application of X-rays to the structure and properties of materials. Laboratory work and conferences. Open to graduates, and to seniors who re-
61. **Research Seminar.** Discussion of research of staff and graduate students. No credit. Each semester.

**Summer Session**

Courses 1, 2, 3, 5, 9, and 13, or similar courses, will be given during the Summer Session of 1930, and several of the more advanced courses will be offered if there is a sufficient demand for them.

75. **CIVIL ENGINEERING**

Professors Riggs*, Gram, King, Hoad, Decker, Worley, Cissel, and Morrison; Associate Professors Wisler, Sherlock, Emmons, and Sadler; Assistant Professors Swinton, Alt and House; Mr. Boyd, Mr. Maugh, and Mr. Jakkula.

Civil Engineering is divided into groups which correspond to the specialties of practicing civil engineers. Since these divisions have come about gradually through the requirements of actual practice, it is inevitable that there should be considerable overlapping of the various fields. The competent civil engineer must have a broad understanding of the scientific principles underlying all of the groups, as well as a high degree of skill in applying these principles to the specialized problems of his own group.

While the training of the civil engineer is essentially technical, it is not always as a technician that he achieves his greatest usefulness. It has come to be quite generally recognized that the habits of thought developed by the practicing civil engineer fit him admirably for administrative and executive positions. This is especially true in the constantly expanding transportation field, in municipal and public affairs, and in many industrial and commercial fields, where a background of technical training, and experience in planning and executing important work, is a valuable aid to the administrator. Many graduate civil engineers are successfully engaged in highway, railroad, municipal, or building contracting.

The main divisions of Civil Engineering are as follows:

**Structural Engineering,** which deals with the theory, design and construction of structures such as bridges, buildings, dams, retaining walls, etc., involving the use of steel, masonry (including reinforced concrete), and timber.

*Absent on leave.
Hydraulic Engineering, which takes up the problems of irrigation, drainage, water power development, navigable rivers and harbors, and deals with the measurement of water and the design and construction of dams, locks, wharves, irrigation works, and all other forms of hydraulic construction.

Transportation Engineering, which deals with railroads, highways, waterways, and other forms of transportation; location, design and construction, maintenance, operation and also the history and economics of transportation systems. The administration, organization and financing of highway improvements and the management, methods, and regulation of highway transport.

Sanitary Engineering, which deals with the design and construction of waterworks, sewers, water purification and sewage disposal works and with all matters related to public sanitation. It offers many opportunities for advanced work and research along the line of prevention of disease by the proper construction and operation of engineering structures.

Municipal Engineering, which deals with the design, construction, and maintenance of paving, sewers, sidewalks, street drainage, waterworks, and other municipal public works, the laws controlling their construction and operation, the proper design and laying out of cities and villages, and the construction and regulation of street railways and other utilities.

The Courses offered the student are designed to give him a knowledge of the principles underlying the general field as outlined above. The system of “group options,” described later, is designed to give the student more thorough training in one of the above groups.

The Department of Civil Engineering tries to anticipate the future requirements of society by seeking the advice of successful graduates, men of affairs in industry, commerce, and public life, and friends of the University generally, so that the graduate may be enabled to render the maximum of service to his community, not only in a technical way, but in social and political ways as well.

The student is required to elect such courses in mathematics and the general sciences as are necessary to a proper understanding of the technical and cultural courses which follow. He is also required to elect courses in Mechanical, Electrical, and Chemical Engineering, as well as in Civil Engineering, since too narrow specialization by undergraduates is discouraged. In addition, he is required to elect not less than three hours of a
technical subject allied to, but not included in, the field of civil engineering. It is felt that with this background, the graduate can augment his technical knowledge as circumstances require it, either by graduate work in the University or by independent study while in practice.

As a part of his cultural work, the student is required to elect a certain minimum number of hours in English and Modern Language. In addition, he is given a group of electives in which a very wide latitude of choice is permitted, covering subjects in Economics, Political Science, Fine Arts, Psychology, Speech, etc. The Department desires to give every possible encouragement to the development of individual capacities.

The Department does not guarantee employment to graduates, but the demand from employers usually exceeds the supply, so that graduates have little trouble in finding lucrative positions in which to obtain their early years of experience.

Graduate Work leading to advanced degrees is offered to graduates whose records indicate that they can pursue it profitably. Conditions under which such work may be undertaken are described in the General Announcement of the Graduate School of the University.

Fellowships of interest to students in Civil Engineering are described in section 44.

Highway Laboratories.—Through a co-operative arrangement between the University and the State Highway Department, all of the testing of materials for the State Trunk Line and Federal Aid roads, and all County roads which receive State aid, is done at the University. The work of the State is done in rooms immediately adjoining those used for the student work, so that the students secure the benefits to be derived from observing the work of full time trained employees of the State, as well as from their own work.

The Highway Laboratory, which has 11,000 square feet of floor space, is located in the basement of the north wing of the East Engineering Building. There are special laboratories for the testing of the following materials: cement, concrete, sand, gravel, broken stone and similar materials; rock and paving brick; asphalt, cements, tars and oils; bituminous mixtures; calcium chloride, metals and paints; and culvert pipe. The laboratories also contain rooms for equipment, balances, concrete curing, storage samples, lockers and showers.

The Laboratory is equipped with all the necessary apparatus for the testing of all kinds of non-bituminous and bituminous materials. Among the more important pieces of apparatus and equipment are a four-cylinder Deval abrasion machine, standard
brick rattlers, ball mills, a briquette molding machine, Page impact machines, a Dorry hardness machine, diamond core drills, a 200,000 pound compression testing machine, a concrete wear testing machine, tensile testing machines, apparatus for testing cement, moist closets, Per Se and Ro-Tap sieve shakers, microscopes, Dulin Rotarex extraction machines, standard penetrometers, ductility machines, viscosimeters, constant temperature baths, Fraes and other types of electric ovens, analytical, chainomatic and torsion balances, field testing apparatus, and a freezing room.

Sanitary Experiment Station.—A small sanitary laboratory, with equipment for experimental work, is available for the study of problems related to public sanitation, especially those involved in the purification of water, the treatment of city sewage and industrial wastes, and the protection of streams from pollution.

Hydraulic Experimental Equipment.—Facilities for experimental work in the measurement of flowing water for discharges up to 250 cubic feet per second are afforded by a flume 138 feet long, 6.5 feet wide, and 8 feet deep. The flume with accompanying equipment is located just below the Argo Dam on the Huron River.

A flume in the West Engineering Building provides for inside laboratory experiments on the measurement of flowing water in quantities up to 12 cubic feet per second. The flume is 50 feet long, 2 feet wide, and 4 feet deep. Water is supplied by a 16-inch centrifugal pump driven by a 100-horsepower motor. Accurate measurement of discharge is provided by scales and weighing tanks with a total capacity of 100,000 pounds. A 90° V-notch weir calibrated by means of the weighing tanks is also available for measurement of flow.

Combined Courses have been arranged with Albion, Battle Creek and Olivet Colleges, and the College of the City of Detroit. For detailed information see section 15.

Advice to Students of other colleges and universities with regard to planning their courses before coming to the University, is to be found in section 14.

Military Science.—The attention of prospective students in Civil Engineering is called to the Reserve Officers Training Corps. Those who consider taking Military Science are urged to enroll at the beginning of their course. For further details see section 64.
CURRICULUM IN CIVIL ENGINEERING AND REQUIREMENTS FOR GRADUATION

Candidates for the degree of Bachelor of Science in Engineering, Civil Engineering, are required to complete the curriculum detailed below unless they specialize in Transportation for which a different curriculum follows. For the definition of an hour of credit see section 50.

*For Modern Language requirement see section 51.
†Physical Training twice a week throughout the year (without credit in hours) is required of all first-year students, unless Military Science (one hour credit each semester) is elected as a substitute. Enrollment in Military Science is for a period of four semesters.
ELECTIVES FOR CIVIL ENGINEERING CURRICULUM

Electives from the following list to a total of at least 11 hours are to be chosen by the student, including not less than 3 hours in each of the two Groups 1 and 2.

Group 1

Advanced courses in Modern Language.
Economics: Courses 51, 52, 53, 54, 121, 122, 123, 131, 133, 173, 175, and 181.
English (Literary College): Courses 31, 32, 40, 45, 143, 147, 148, 180, 183, and 184.
Fine Arts: Courses 101 and 128.
History: Courses 3, 4, 5, 6, 43, 44, 45, 46, 92, 145, and 146.
Philosophy: Courses 31, 38, and 139.
Political Science: Courses 31, 32, 141, and 142.
Psychology: Courses 31 and 122.
Speech: Courses 31, 42, and 144.

Group 2

Astronomy: Courses 31, 32, 33, 35, 103, and 104.
Bacteriology: Courses 3E and 5E.
Botany: Courses 1, 32, 33, 35, 36, and 158.
Chemistry: Courses 15, 36, 42, 53, 57, and 67.
Engineering Mechanics: Courses 20, 5, 6, 9, 12, 13, 15, and 16.
Forestry: Courses 2, 31, 32, 33, 34, 102, 107, and 108.
Geology: Courses 32, 105, 122, 123, 124, 131, 132, 133, and 134.
Hygiene and Public Health: Course 1.
Mineralogy: Courses 31, 101, 104, and 107.
Physics: Courses 105, 171, 175, and 181.
Surveying: Courses 3, 5, 7, 9, 21, and 22.
Zoology: Courses 1, 31, 32, and 42.
Co-operative Courses 95, 19s, 29s, 39s, 49s, and 59s.

Note.—Military Science, after the freshman year, is classified as Group 2.

Students wishing to take electives not listed in Groups 1 and 2 may do so if they have the endorsement of the Professor of Civil Engineering.
CIVIL ENGINEERING

GROUP OPTIONS

Each student in Civil Engineering must elect seven hours' work from the courses listed under Group Options. One of the courses elected must in general be a design course.

The group options are arranged to assist the student in selecting a program of seven hours of specialized study in related subjects, and he is urged but not required to elect the entire seven hours in one group.

A. STRUCTURAL ENGINEERING.

Civil Eng. 4, Advanced Theory of Structures..... 2 hours
Civil Eng. 5, Design of Structures .............. 3 hours
Civil Eng. 6, Foundations and Resistance of Soils. 3 hours
Civil Eng. 7, Advanced Design of Structures
   a. Bridge Design .................................. 3 hours
   b. Reinforced Concrete ................................ 3 hours
   c. Arches ........................................... 2 hours
   d. Timber Construction ................................ 1 hour
Civil Eng. 8, Construction Methods and Equipment 2 hours
Civil Eng. 9, Cost Analysis and Estimating....... 2 hours
Civil Eng. 27, Public Utility Problems .............. 2 hours
Civil Eng. 65, Structural Engineering Research...
Mech. Eng. 20, Mechanical Handling of Materials.. 2 hours
Chem. Eng. 6, Iron and Steel ......................... 2 hours
Chem. Eng. 8, Metallography ........................ 2 hours

Students electing Group A are required to elect Design Course 5.

B. HYDRAULIC ENGINEERING.

Civil Eng. 11, Hydraulics .......................... 2 hours
Civil Eng. 12, Development of Water Power ....... 3 hours
Civil Eng. 13, Administration of Water Resources. 2 hours
Civil Eng. 14, Irrigation and Drainage .............. 2 hours
Civil Eng. 16, Design of Hydraulic Structures..... 3 hours
Civil Eng. 18, Rivers and Harbors .................. 1 hour
Civil Eng. 27, Public Utility Problems .............. 2 hours
Civil Eng. 61, Irrigation and Drainage, Advanced 2 hours
Civil Eng. 62, Hydraulic Design, Advanced ........ 2 hours
Civil Eng. 64, Hydraulic Engineering Research...
Mech. Eng. 4, Hydraulic Machinery .................. 3 hours
Mech. Eng. 16, Water Turbines ...................... 3 hours
Mech. Eng. 20, Mechanical Handling of Materials.. 2 hours
Elec. Eng. 30, Alternating Current Apparatus ..... 4 hours
Elec. Eng. 11, Power Plants, Transmission and Dis. 5 hours
Elec. Eng. 33, Industrial Electrical Engineering.. 2 hours
Elec. Eng. 36, Rates and Cost Analysis.............. 2 hours

Students electing Group B are required to elect Design Course 16 and Course 12, the accompanying theory course.

C. TRANSPORTATION ENGINEERING.

Civil Eng. 18, Rivers and Harbors .................. 1 hour
Civil Eng. 27, Public Utility Problems ............ 2 hours
Civil Eng. 36, Municipal Engineering .............. 2 hours
Civil Eng. 41, Highway Engineering, Theory and
  Economics .................................. 2 hours
Civil Eng. 42a, Highway Materials Laboratory .... 2 hours
Civil Eng. 42b, Bituminous Materials Laboratory .. 2 hours
Civil Eng. 44, Highway Transport .................. 2 hours
Civil Eng. 45, Highway Traffic Control ............ 2 hours
Civil Eng. 46, Highway Administration ............ 2 hours
Civil Eng. 51, Railroad Location .................. 2 hours
Civil Eng. 52, Railroad Maintenance ............... 2 hours
Civil Eng. 52a, Heavy Excavation and Tunnel Work 2 hours
Civil Eng. 53, Terminal Design .................... 3 hours
Civil Eng. 54, Railway and Highway Location De-
  sign ..................................... 3 hours
Civil Eng. 55, Transportation ...................... 2 hours
Civil Eng. 55a, Transportation ..................... 2 hours
Civil Eng. 58, Inland Waterway Transportation .... 2 hours
Civil Eng. 63, Civil Engineering Research ........ 2 hours
Civil Eng. 66, Highway Engineering and Highway
  Transport Research ........................... 3 hours
Civil Eng. 67, Railroad Engineering Research .... 3 hours
Mech. Eng. 20, Automobiles and Motor Trucks ..... 3 hours
Elec. Eng. 8, Electric Railways .................... 2 hours
Elec. Eng. 11, Power Plants, Transmission and Dis-
  tribution .................................. 5 hours

Students electing Group C are required to elect a design
course of this group.

D. SANITARY AND MUNICIPAL ENGINEERING.

Civil Eng. 7a, Concrete and Steel Highway Bridge
  Design .................................... 3 hours
Civil Eng. 11, Hydraulics .......................... 2 hours
Civil Eng. 27, Public Utility Problems ............. 2 hours
Civil Eng. 31, Water Purification ................... 2 hours
Civil Eng. 33, Sewage Disposal .................... 2 hours
Civil Eng. 34, Municipal and Industrial Sanitation .. 2 hours
Civil Eng. 35, Sanitary Engineering Design ......... 3 hours
Civil Eng. 36, Municipal Engineering ............... 2 hours
Civil Eng. 41, Highway Engineering Theory and
  Economics .................................. 2 hours
Civil Eng. 42, Highway Engineering Laboratory .... 2 hours
Mech. Eng. 20, Mechanical Handling of Materials ... 2 hours
Mech. Eng. 25, Heating and Ventilation ............ 2 hours

Students electing Group D are required to elect Design Course
35 and Course 31, 33, or 34.
CIVIL ENGINEERING

E. GENERAL ENGINEERING SCIENCE.

Physics
Chemistry
Astronomy
Mathematics
Mechanics
Mineralogy
Geology

This group is arranged to permit students of high scholastic standing to take advanced work in any of the above subjects. Courses elected in this group must be in advance of the last required course in the subject chosen. Students electing seven hours’ work in any one of the subjects will not be required to elect a design course.

Any student electing this group shall indicate the fact not later than the beginning of his junior year and all elections in the chosen science shall be with the approval of the Head of the Science Department, or a committee chosen by him.

CURRICULUM IN TRANSPORTATION AND REQUIREMENTS FOR GRADUATION

Candidates for the degree of Bachelor of Science in Engineering, Civil Engineering, who specialize in Transportation are required to complete the curriculum detailed below. For the definition of an hour of credit see section 50.

Co-operative Courses with Industry. Courses 9s, 19s, 29s, 39s, 49s, and 59s are offered to students in Civil Engineering. The work under these courses consists of employment by an approved company engaged in work in which Civil Engineering students are interested, during the summer vacation, June to October, or during a semester. While employed, the student will be paid standard

*For Modern Language requirement see section 51.
†Required Electives may be chosen from Military Science, 5 hours; or co-operative courses in industries, 5 hours; or approved electives, 5 hours.
‡Major Electives may be in Aeronautical, Automobile, Electrical, Highway, Marine, or Railway Engineering.
wages for work done. Work under these courses when completed carries a minimum of five hours credit for ten months of work and an additional hour for each additional two months of work up to a total of sixteen months. These courses must be elected during the freshman and sophomore years. The work is done in accordance with a prearranged plan and schedule and under close supervision of some member of the Civil Engineering staff. Credit for this work comes under Group 2, Electives for Civil Engineering.

Graduate Students in Civil Engineering may specialize in any of the above groups. Such students will ordinarily be required to complete at least eight hours in one of these groups. Additional work sufficient to complete the requirements for the M.S. degree may be selected from cognate subjects, which must be approved by the Dean of the Graduate School.

It is recommended that fourth year students who are expecting to enter the Graduate School take at least six hours of economics before graduation. Graduate students will usually be required to elect from three to six hours of approved work in either the College of Literature, Science, and the Arts or in the School of Business Administration.

COURSES IN CIVIL ENGINEERING

The courses described below are identified by letters and course numbers. Thus, Civil Engineering, Course 2, is identified as C.E. 2. Also C.E. 65, etc., etc.

Structural Group, C.E. 1 to C.E. 9.
Hydraulic Group, C.E. 10 to C.E. 19.
Transportation Group, C.E. 40 to C.E. 58.
Sanitary and Municipal Group, C.E. 30 to C.E. 39.
Graduate Group, C.E. 60 to C.E. 67.

2a. Elementary Design of Structures. Design work, covering theory of beams and plate girders, mill buildings, and elements of design of simple structures. Computations, drawing work. Pr-
requisites: Drawing 3, and preceded or accompanied by C.E. 2. Required of all Civil Engineering students. Three hours credit. Each semester.

3. Masonry Construction. Properties of materials; analysis of stresses in plain and reinforced concrete structures; foundations for engineering structures; theory and design of concrete mixtures; laboratory work on cement and aggregates. Three recitations and one three-hour laboratory period. Prerequisite: E.M. 2. Required of all Civil Engineering students. Four hours credit. Each semester.

4. Advanced Theory of Structures. Analysis of stresses and deflection in special types of structures, cantilever trusses, draw spans, and arches. This is a continuation of C.E. 2. Lectures, text, problems. Prerequisite: C.E. 2. Two hours credit. Each semester.

6. Foundations and Resistance of Soils. A study of the theory and design of foundations with special reference to soil as an engineering material; physical characteristics of soils; determination of bearing capacity; plastic flow; pressure distribution; standard practice; recent developments in soil research. Lectures and references. Prerequisite: C.E. 3. Three hours credit. Each semester.

7. Advanced Design of Structures. A group of optional specialized courses as listed below for students desiring advanced and specialized instruction in the design of various classes of structures. Students may elect these courses simultaneously. C.E. 7 group is open to graduate students and to qualified seniors by special permission. Each semester.

7a. Bridge Design. Studies of waterway determination and bridge live loads; design of bridge foundations and superstructures. Computations, drawing work. Prerequisites: C.E. 4 and C.E. 5. Three hours credit. Second semester.

7c. Arches. Analysis of stresses and design of arches, especially reinforced concrete arches. Lectures, drawing work. 
*Prerequisite: C.E. 5.* Two hours credit. Second semester.

7d. Timber Construction. Physical characteristics of structural woods; selection of timber; grading rules; commercial practice; design of typical structures. Lectures, drawing work. 
*Prerequisite: C.E. 2a.* One hour credit. Each semester.

8. Construction Methods and Equipment. Deals with contractors' organizations, laws of management, plant selection and layout; catalogue studies of various types of equipment, their operating characteristics and care. Lectures, class discussion. 
*Open to seniors and graduate students.* Two hours credit. Each semester.

*Open to seniors and graduate students.* Two hours credit. Each semester.

10. Hydrology. A study of natural streams; measurement of stream discharge; continuous discharge records; factors affecting precipitation; evaporation from land and water surface; relation of precipitation to stream flow; estimating stream flow; storage of water; floods. Two recitations and one three-hour laboratory period. 
*Prerequisite: E.M. 4.* 
*Open to seniors and graduate students.* Three hours credit. Each semester.

11. Hydraulics. Fundamental considerations; application of experimental data to hydraulic problems; orifices, weirs, pipes and open channels; analysis of empirical formulas; transportation of sediment. Lectures, problems. 
*Prerequisite: E.M. 4.* Two hours credit. Each semester.

12. Water Power. History of science; hydraulic and hydrological studies; power output of streams; hydraulics of turbines; selection of turbines, power plant layout and equipment; general study of dams; economic considerations; engineering reports on water power developments. Lectures, recitations, problems. 
*Prerequisite: E.M. 4.* 
*Open only to seniors and graduate students.* Three hours credit. Second semester.

13. Administration of Water Resources. Progress made by India, Egypt, Italy, France, and Spain; development of common law doctrines relating to waters and their introduction into the United States; a few leading decisions; the abrogation of the common law rule in the Arid Region; an engineering administration,
based on principles, contrasted with court government under the common law doctrine; examples of water administrations in western states. Lectures, assigned reading, reports. **Prerequisite:** E.M. 4. *Open only to seniors and graduate students.* Two hours credit. Second semester.

14. **Irrigation and Drainage.** History of the development of both sciences; demand for them in the United States; principles underlying the use of water from streams; laws relating to irrigation and drainage; engineering principles; water supply; water available and required; diversion works; conveyance system; distribution systems; structures; maintenance; economic considerations. Lectures, assigned reading. **Prerequisite:** E.M. 4. *Open only to seniors and graduate students.* Two hours credit. Second semester.

16. **Hydraulic Engineering Design.** Description of hydraulic structures; hydraulic and structural computations; design of two or more hydraulic structures; water conveyance structures; dams; power houses; head gates; wasteways; regulating works. Lectures, computations, design. **Prerequisite:** C.E. 3, and preceded or accompanied by C.E. 12. Three hours credit. Second semester.

18. **Rivers and Harbors.** Classification and description of harbors; wave action and littoral drift; design and construction of artificial harbors; entrance to harbors; breakwaters; wharves; quays; dredging; description of various American and foreign harbors; maintenance of river channels. Lectures, assigned reading, reports. **Prerequisite:** E.M. 4. One hour credit. Second semester.

26. **Specifications, Contracts, and Engineering Relations.** Engineering relations; ethics; the engineer as a witness; contracts; bids and bidders; public lettings; methods of payment for contract and extra work; specifications. Lectures, reading, discussion. *Open to junior, senior, and graduate students in Engineering and in Business Administration.* Required of all Civil Engineering students. Two hours credit. Each semester.

27. **Public Utility Problems.** Relation of public service corporations to the public; organization; ownership; valuation; depreciation; accounting; regulation; taxation; rates; problems of different utilities. Lectures, library reading. *Open to fourth and fifth year students.* Two hours credit. Each semester.

30. **Water Works.** A general study of municipal water supply. Quantity required and quality necessary for various
purposes; public health relationships; sources of supply; impounding reservoirs; wells, intakes; aqueducts and pipe lines; purification works; distribution; fire protection. Lectures, problems. Pre-requisite: E.M. 4. Open to seniors and graduate students. Three hours credit. Each semester.

31. Water Purification. Relates to engineering methods and devices for improving the sanitary quality and economic value of municipal water supplies; processes of sedimentation; use of coagulants; filtration; softening; iron removal; sterilization; devices and structures for accomplishing these. Lectures, library reading, and visits to municipal water purification plants. Prerequisite: C.E. 30. Open to seniors and graduate students. Two hours credit. Second semester.

32. Sewerage and Drainage. Functions and purposes of sewerage and drainage systems; health relationships; principles of design of sanitary, storm water, and combined sewers; trunk sewers, intercepting sewers, inverted siphons, and other special structures; groundwater infiltration and its effects; sewer assessments; proper treatment and final disposal of sewage. Lectures, problems. Prerequisite: E.M. 4. Open to seniors and graduate students. Two hours credit. Each semester.

33. Sewage Disposal. A broad survey of the engineering, public health, legal, and economic problems involved in the disposal of city sewage and industrial wastes. Sewage treatment processes and devices; adaptation to climatic and other natural conditions; operation and maintenance; costs. Lectures, library reading, and visits to near-by disposal plants. Prerequisite: C.E. 32. Open to seniors and graduate students. Two hours credit. Second semester.

34. Municipal and Industrial Sanitation. The scientific foundations of public sanitation; the prevention of typhoid fever, malaria, and other diseases, through water purification, sewerage and drainage, and other major sanitary improvements involving community control of the environment; the collection, utilization, and disposal of garbage and other city wastes; street cleaning methods, organization, and management; and industrial sanitation. Lectures, library reading. Open to seniors and graduate students. Three hours credit. Each semester.

35. Sanitary Engineering Design. Computations and drawing board design of pipe lines, large conduits, typical structures in reinforced concrete related to water supply, water purification, sewerage, and sewage disposal. Drawing room and visits to plants and work under construction. Prerequisite: C.E. 3, and
accompanied or preceded by either C.E. 31, C.E. 33, or C.E. 34. Required in election of Group D. Three hours credit. Each semester.

40. Highway Engineering. Historical development; economics, administration, and legislation; preliminary investigations; design of road and street systems and the individual highway; drainage and foundations; highway materials; construction and maintenance of roads and pavements; street cleaning and snow removal; highway structures. Lectures, text. Required of all Civil Engineering students. Open to juniors, seniors, and graduate students, but not restricted to engineering students. Two hours credit. Each semester.

41. Highway Engineering Theory and Economics. Theory and economics of design of road and street systems, the individual highway and its component parts, drainage systems, comparison of roads and pavements; highway transport surveys; traffic classification, census, and investigations; estimating future traffic. Lectures, text. Prerequisite or accompanying courses: C.E. 40 and E.M. 1. Open to juniors, seniors, and graduate students. Two hours credit. First semester.

42. Civil Engineering Laboratory. A group of optional laboratory courses, as listed below, for students desiring to study the physical properties of materials used in civil engineering construction.

42a. Highway Materials Laboratory. Physical properties of highway materials; testing of sand, gravel, rock, slag, cement, aggregates, cement-concrete, brick, wood block, stone block, and bituminous materials; proper method of reporting and interpreting results of tests. Lectures, text, laboratory. Prerequisite or accompanying course: C.E. 40. Open to juniors, seniors, and graduate students. Two hours credit. Each semester.

42b. Bituminous Materials Laboratory. Properties of bituminous materials; testing of oils, asphalts and tars; theory and design of bituminous paving mixtures; interpretation of results of tests; specifications. Lectures, text, laboratory. Prerequisite: C.E. 40. Open to juniors, seniors, and graduate students. Two hours credit. Each semester.

42c. Concrete Mixtures. Theory and design of concrete mixtures; analysis of aggregate grading; bulking due to moisture; strength, permeability, durability, yield, and economy. Discussions, problems, laboratory. Open to seniors. This class meets with the laboratory section of C.E. 3. The course is offered to permit
election of the work by seniors outside the Civil Engineering Department. One hour credit. Each semester.

44. **Highway Transport.** History of highway transport development; economics and fundamentals of different methods of transportation of passengers and commodities over highways; utilization of highway transport by railroads; legislation pertaining to operation of motor trucks, trailers, and motor busses as private and common carriers; traffic regulations; management of transportation companies; cost of operation of motor vehicles. **Open to seniors and graduate students, but not restricted to engineering students.** Two hours credit. Second semester.

45. **Highway Traffic Control.** Street traffic surveys; causes of congestion; causes of accidents; physical changes to increase street capacity; regulation of moving traffic; regulation of parking; regulation of pedestrians; traffic signs and signals; municipal traffic codes; traffic bureaus; treatment of offenders. Lectures, text, field work, library reading. **Open to seniors and graduate students, but not restricted to engineering students.** Two hours credit. Second semester.

46. **Highway Administration.** Development of highway administration and highway systems, local, county, state, and national; methods of financing roads and streets; functions and organization of highway departments. Lectures, text, library reading. **Open to seniors and graduate students, but not restricted to engineering students.** Two hours credit. First semester.

50. **Railroad Engineering.** A general study of the railroad problem. Includes a consideration of surveys, alignment, earthwork, trestles, structures, tunnels, ballast, ties, rails, rolling stock, train resistance, block signals, train control, yards and terminals, operating expenses and organization. Lectures, text, problems. **Required of all Civil Engineering students. Open to juniors and seniors, but not restricted to engineering students.** Two hours credit. Each semester.

51. **Railroad Location.** Economics of reconnaissance, preliminary and location surveys, analysis of curve, grade, and train resistance. Ruling grades; maximum curvature; rise and fall; and virtual profile. Study of line changes, grade reductions, and elimination of grade crossings. Lectures, text, problems. **Open to junior, senior, and graduate students.** Two hours credit. Each semester.

52. **Railroad Maintenance.** Maintenance of roadway, track, track appliances, switches and frogs, bridges, structures, culverts and drainage, signals and interlocking plants. Lectures, text, prob-
lems. Open to junior, senior, and graduate students. Two hours credit. First semester.

52a. **Heavy Excavation and Tunnel Work.** Study of the methods and machinery applicable to all types of heavy excavation. Location, design, and construction of all types of tunnels. Lectures, text, problems. Open to junior, senior, and graduate students. Two hours credit. Second semester.

53. **Terminal Design.** Design of freight and passenger railroad, highway, and waterway terminals, joint terminals, layout of the various types of yards and traffic facilities. Occasional field inspections take the place of design periods. Text, problems, drawing room. Open to junior, senior, and graduate students. Three hours credit. Second semester.

54. **Railway and Highway Location Design.** Field and office practice of location and construction. Text, field work, and drawing room. Open to junior, senior, and graduate students. Three hours credit. First semester.

55. **Transportation.** History of transportation; relation of highway, waterway, railway and airway transportation. Lectures, library research, seminar. Open to junior, senior, and graduate students, but not restricted to engineering students. Two hours credit. First semester.

55a. **Transportation.** The relation of transportation to the political and economical development of the nation. Lectures, library research, seminar. Open to junior, senior, and graduate students but not restricted to engineering students. Two hours credit. Second semester.

58. **Inland Waterway Transportation.** Engineering and economic problems involved in the development of American inland waterway transportation. Lectures, library reading, recitations. Open to junior, senior, and graduate students, but not restricted to engineering students. Two hours credit. First semester.

60. **Sanitary Engineering Research.** Assigned work upon some definite problem related to public sanitation; a wide range in both subject matter and method is available, covering field investigations, experimentation in the laboratory, searches in the library and among public records, and drafting room designing. By appointment. Open to graduate students only. Credit to be arranged.

61. **Irrigation and Drainage.** Special advanced assigned work. Reading, research. Prerequisite: C.E. 14. Open only to graduate students. Credit to be arranged. Each semester.

63. **Civil Engineering Research.** Assigned work in the fields of transportation, public utilities, or engineering relations and ethics. Exact nature of work to be determined by needs of individual students. To obtain credit a thesis must be prepared which would be acceptable for publication. *Open only to graduate students.* Credit to be arranged. Each semester.

64. **Hydraulic Engineering Research.** Assigned work in hydraulic research; investigation of some problem or subject in hydraulics approved by the Professor of Hydraulic Engineering; a wide range of matter and method permissible. Reading, experiments, thesis. *Prerequisite: C.E. 12. Open only to graduate students.* Credit to be arranged. Each semester.

65. **Structural Engineering Research.** Assigned work on some approved problem in structural engineering, preferably experimental work with discussion of derived data. Laboratory, library research. *Open to graduate students and fifth-year students who have elected Group Option A in structural engineering.* Credit to be arranged.

65a. **Seminar in Advanced Theory of Structures.** Study of special problems in theory of structures under the direction of Professor Timoshenko. *Open to qualified graduate students.* Credit to be arranged.

66. **Highway Engineering and Highway Transport Research.** Assigned work in the fields of highway engineering, highway transport, or highway traffic control. Exact nature of work to be determined by needs of individual students. To obtain credit a thesis must be prepared which would be acceptable for publication. *Open only to graduate students.* Credit to be arranged. Each semester.

67. **Railroad Engineering Research.** Assigned work in the field of railroad engineering or highway traffic control. Exact nature of work to be determined by needs of individual students. To obtain credit a thesis must be prepared which would be acceptable for publication. *Open only to graduate students.* Credit to be arranged. Each semester.

**Summer Session**

Courses 2, 7c, 44, 45, 65, and 66, or similar courses, will be given during the Summer Session of 1930.
Electrical engineers practice in a field of great breadth; any true subdivision of it is very difficult. The six main divisions of practice, and work offered by the Department in relation thereto, are as follows:

**Electrical Power Engineering** has to do with the theoretical and practical phases of power generation, distribution, and utilization, together with the design and construction of the apparatus involved; among other specific applications it relates to electric railways, lighting, power plants, transmission, distribution, generators, motors, and the service of the public. The almost phenomenal growth of the electric public utilities and the corresponding use of electricity indicate the opportunities existing in this branch.

In Courses 11, 19, and 20, fundamental economic principles are applied to the selection and location of standard apparatus; the financial phases of design are stressed; analytic engineering judgment is cultivated through the study of the operative functions of generating and transmitting devices. Course 8 covers the main problems of electric traction; Course 33, industrial electrical engineering; and Course 36, rate and cost analysis.

**Electrical Communication** covers several very large fields of application of electricity to the service of man. The transmission of signals, speech, music, and the more recent transmission of pictures, involve the practice of telephony, telegraphy, electric signalling, and radio. The radio business has been doubling every year, it being already one of the country's largest industries.

Courses 10, 21, and 22 in communication apply the principles developed in previous courses to new apparatus and circuits. The work prepares the student for opportunities in the communication industry, or strengthens him for work in other fields, by virtue of his broadened perspective.

**Illumination Engineering** is now an electrical activity because of the fact that nearly all light sources are electrical. The illumination engineer deals with the many and varied special problems arising in relation to the production and utilization of light, economically and in accordance with correct principles of physics, physiology, psychology, art, and architecture.

The purpose of the work available to the undergraduate is to indicate the scope, present and prospective importance, and attractiveness of illumination as a field of professional activity, and to establish firmly by thorough drill the principles upon which
progress must be founded. Courses 7 and 7a are primarily for undergraduates; Courses 15, 71, 72, and 73, are for graduates and competent undergraduates. Much advanced work in illumination is pursued in Courses 9 and 18.

**Electrical Engineering Design.**—Inasmuch as every article ever produced must first be designed, design practice comes into most phases of electrical engineering. Design involves the use of fundamental theory as modified by practical considerations of cost and the properties of materials. The successful designer is generally found to be a man with pronounced and special aptitudes; such men have a wide choice of opportunities.

Courses 5, 6, and 51 are not intended to turn out finished designers. Their purpose is to clarify the student's knowledge of apparatus by means of extended calculations on machines; and by imposing some of the limitations encountered in practical work, to insure that the student will think as an engineer rather than as a physicist.

**Electrical Theory and Laboratory Technique** constitute a division of work in the Department that is of growing importance in the field. The rapid development of electrical engineering and its relation to many applications of great variety have created a demand for workers with a more extensive training in fundamental electrical and physical theory and laboratory procedure.

Courses 1 and 25 develop the fundamental field theory of electricity and magnetism, and show the significance of recent developments in physics.

Course 12 forms the basis for the study of the theory of electronic phenomena and gives its application to many important engineering questions. Courses 16 and 21, respectively, discuss the application of electronic phenomena to the problems of rectification and vacuum tubes.

Course 26 develops the Heaviside operational method and gives its application to electrical circuit theory.

Course 28 provides the opportunity for the student to gain experience in the laboratory in making accurate measurements with equipment of the highest quality.

**Research.**—The staff in electrical engineering is always very glad to offer its laboratory facilities and advice to graduate students who wish to work on research problems leading to one of the higher degrees. In keeping with this policy the department each year offers several teaching assistantships to graduate students.
Course 18 may be elected by graduate students pursuing re-
search, while Course 9 serves the same purpose for under-
graduates.

The Courses offered by the Department are therefore de-
signed to give every electrical student some training in each of
the above classes of work; and in his selection of technical elec-
tives he may, if desired, take more advanced work in any of the
groups of studies mentioned. In addition to this specific group of
subjects, other courses are offered, some preparatory, some ad-
vanced.

Course 1 serves as an introduction to the engineering view-
point of electricity and magnetism.

Courses 2, 3, and 4 form a close-knit preparatory group de-
voted to the principles of the more usual circuits and machines.
Course 17, of a mathematical nature, develops electromechanics.

Courses 9 and 18 are open to more able students by permis-
sion, and give opportunity for study of any worthwhile problems
not excluded by the limitations of physical equipment.

The Staff of the Department of Electrical Engineering, by
constant study and revision of course content and teaching method,
aims to offer such work as will react to the ultimate benefit of
the student rather than to his immediate gain. Throughout, the
教学 of theory and its modifications by practice, the develop-
ment of analytic judgment, and the acquiring of a fundamental
scientific background, are emphasized. The acquisition of specific
factual knowledge is left, except where necessary to sound peda-
gogy, to the training in actual experience through which every
electrical graduate must go during his first years out of school.

Close contact is maintained with the employing industries
both to enable the instructional staff to keep in touch with a fast-
growing art, and to facilitate the finding of employment for the
graduates.

In co-operation with the School of Business Administration
a five-year course leading to the degree of B.S. in Engineering
(Electrical and Industrial Engineering) is offered.

A five-year co-operative program in Electrical Engineering
and Industry is offered in co-operation with certain leading elec-
trical industries. The student spends in all four semesters or
sixteen months in one chosen industry. In this program the re-
quired university work is the same as that for students choosing
the regular program in Electrical Engineering. However, suc-
cessful completion of the industrial part of the program entitles
the student to nine credit hours which may be counted as nine
hours of elective studies. The time spent in the University will
be made up of those semester and summer session periods during
which the student is not connected with the industry. The work in industry will be closely supervised by an officer of the University.

Graduate work is urged for every student who would benefit by taking more advanced work. The graduate courses offered are being built up from year to year. The mathematical and physical nature of advanced electricity makes it profitable for some gifted students to spend much time in mathematics and physics; for the better students every encouragement is offered.

The individual initiative of exceptional seniors is encouraged by seminar, research, and special problem courses offered for the purpose.

FACILITIES

The Electrical Engineering Laboratories include a dynamo laboratory, communication laboratories, a photometric laboratory, and an electrical standards laboratory.

The Dynamo Laboratory is fully equipped with direct and alternating current apparatus of various types and sizes, representative of the leading American and foreign manufacturers.

In all of the electrical laboratory work, special emphasis is laid upon the development of the student's ability to analyze the phenomena which he observes in the operation of electrical machinery. To this end, and with the aim of developing the personal initiative of the student, a large number of moderate-sized machines have been provided in order to give each student intimate contact with the apparatus.

The laboratory is fully equipped with meters and instruments of various ranges, types, and makes. The equipment includes four oscillographs with all accessories.

Distribution of power in the laboratories is controlled through a plug and socket system. The system gives great flexibility and requires that all connections be made by the student himself, but provides the means by which these operations may be quickly and easily performed.

The laboratory has on exhibit electrical apparatus of very early type which is of historic interest.

The Communication Laboratories are unusually well equipped for both practical and theoretical experimental study of communication by electrical means.

Oscillators covering both the audio and radio frequency ranges, vacuum tube voltmeters and ammeters, and impedance bridges are provided for accurate measurements. Standards of inductance, capacity, and resistance are available.

For telephone work an artificial open wire line, a loaded cable, and standard cable may be used for the study of the propa-
gation of medium frequency voltages and currents. A supply of telephone instruments, sensitive meters, transformers, telegraph instruments including repeaters, and models of manual and automatic exchanges are provided for study.

The radio laboratory is well equipped with vacuum tubes for both receiving and transmitting purposes, high voltage generators for power supply, standard wavemeters and capacities, thermo ammeters and the usual types of auxiliary apparatus. A cathode ray oscillograph is provided for the study of high frequency currents.

The Photometric Laboratory is equipped with four precision bars provided with the most accurate photometer heads of equality, contrast, and flicker types, and complete accessories for standardization and investigation; eight portable photometers, of four different types, for making surveys of illumination; a single-mirror selector for making measurements on large light sources; a 30-inch integrating sphere for small light sources together with a Macbeth illuminometer, an 80-inch sphere for large sources; a Taylor part-sphere for measuring the reflection coefficient of surfaces in place, and a most convenient form of spectrophotometer (Keuffel and Esser color analyzer), arranged especially for measurements of reflection and transmission of light. A Weber photometer with accessories, and a daylight recorder, consisting of a Case photelectric cell connected to a Leeds and Northrup recording potentiometer, are available for use in research work. The equipment includes, besides standard lamps, a complete and modern collection of lamps and accessories including mercury, magnetite, and carbon arcs, refractors, reflectors of all varieties in glass and metal, and some projectors. Special equipment has been developed for study of surface sources of light by means of which noteworthy investigations have been made and published.

The Electrical Standards Laboratory is provided with standards of resistance, inductance and capacitance, standard cells, potentiometers, galvanometers, meters of the precision type, and ratio and phase angle testing equipment for current and potential instrument transformers.

The University has a medium-sized steam power plant of its own which is available for instructional purposes; also the University is well situated with regard to both hydraulic and steam power plants of the Detroit Edison Company. Technical inspections of these plants are made in conjunction with the class-room work in appropriate courses.

Visits of Inspection.—See section 42.
Combined Courses have been arranged with Albion, Battle Creek and Olivet Colleges and the College of the City of Detroit. For detailed information see section 15.

Advice to Students of other colleges and universities with regard to planning their courses before coming to the University is to be found in section 14.

Military Science.—The attention of prospective students in Electrical Engineering is called to the Reserve Officers Training Corps. Work offered in the Signal Corps group is of special interest to students in Electrical Engineering, as they are well qualified for it. Those who consider taking Military Science are urged to enroll at the beginning of their course. For further details see section 64.

CURRICULUM IN ELECTRICAL ENGINEERING AND REQUIREMENTS FOR GRADUATION

Candidates for the degree of Bachelor of Science in Engineering, Electrical Engineering, are required to complete the curriculum detailed below. For the definition of an hour of credit see section 50.

The periods spent in industry, during the second to fifth years inclusive, may be taken in the first, instead of the second, semester.

Credit for the course will be as follows:

- Required university work .............. 127 hours
- Elective university work .............. 4 hours
- Credit for completing the industrial work 9 hours

Total .................................. 140 hours

No credit will be given for industrial work except as arranged under the co-operative plan.

It is contemplated that the student will spend all four outside periods with one industrial concern. This, if mutually agreeable, may lead to permanent employment. During his employment the student will work in various departments of the industry and will receive pay.
Co-operative relations shall be established only with such industries as are able and willing to offer a definite program of graded work of educational value.

**CHOICE OF ELECTIVE WORK**

The Department of Electrical Engineering has no list of group options. The case of each individual student is considered and he is expected to make his elections only after consultation with the senior classifiers.

The aim of the Department is to develop well-rounded engineers rather than narrow technicians.

Without the ability to write and speak good English an engineer rarely progresses to the higher positions in the profession. Students feeling the lack of sufficient facility in the use of English are strongly urged to elect advanced courses in English.

Economic considerations enter into every phase of engineering work. Every student is therefore urged to take at least one course in economics.

In the senior year the student should in general have some idea of the branch of electrical engineering which he intends to pursue. It is expected that he will take at least one advanced course in the line of work in which he intends to specialize.

With the object of rounding out his education the student is urged to elect some courses in liberal arts and pure science. Unless he is a liberally educated man in addition to being an engineer he cannot expect to reach the positions of highest importance.

The strong student who can profit by the instruction is urgently advised to consider the desirability of at least one year of graduate work leading to the master's degree. In such a year he will have opportunity to take advanced work along the lines in which he expects to specialize. Such work is usually impracticable in the undergraduate years due to lack of time and adequate preparation.

**COURSES IN ELECTRICAL ENGINEERING**

1. **Principles of Electricity and Magnetism.** Mathematical and physical treatment of force actions and energy relations in electrostatic and electromagnetic fields; capacitance and inductance of systems of conductors; development of systems of electric and magnetic units; illustrations of the universality of the laws of physics, as they occur in the fields of electricity, magnetism, gravitation, heat, light, etc. Three lectures and one four-hour computing period. **Prerequisites:** Math. 34 and Physics 46. Four hours credit. Each semester.

2. **Direct Current Apparatus and Circuits.** Torque, current, flux, e.m.f. and speed relations in self-regulation and control of motors and generators; electric and magnetic circuit calcula-
tions; power losses and efficiency of machines; commutation and armature reaction; parallel operation of generators; mechanical and electrical coupling of motors. Three lectures and one four-hour laboratory period. Prerequisites: Physics 45 and 46, E.M. 1. Four hours credit. Each semester.

2a. Direct and Alternating Current Apparatus and Circuits. Characteristics of direct and alternating current motors and generators; problem work on these and on electric circuits. A general course for non-electrical students. Three lectures and one four-hour laboratory period. Not open to electrical engineering students. Required of all other students in Engineering. Four hours credit. Each semester.

3. Alternating Current Circuits. Wave form of e.m.f.; work on simple harmonic e.m.f.'s and currents; phase differences; active, reactive and apparent power, power factor and reactive factor; resistance, inductance, and capacitance, singly and in any combination; polyphase circuits, balanced and unbalanced; power in polyphase system; e.m.f.'s of armature windings—vector representation and calculation; transformers — construction, theory, operation, simple and complete vector diagrams, losses and constants, efficiency and regulation; instrument transformers; voltage regulators; constant current transformers. Three lectures and one four-hour laboratory period. Prerequisites: E.E. 2, and preceded or accompanied by E. E. 1. Four hours credit. Each semester.

4. Alternating Current Machinery. Principles of the synchronous machine, the induction machine, the rotary converter, and the various types of single-phase motors. Lectures, recitations, and one four-hour laboratory period. Prerequisite: E.E. 3. Four hours credit. Each semester.

5. Design of Electrical Machinery and Appliances. Design problems on direct current coils, windings, motors; work in heat storage, heat transfer, and heat dissipation by radiation and convection; extensive treatment of magnetic field mapping and calculation, armature reaction, air gap design, and commutation. Two lectures and two four-hour computing periods. Prerequisites: M.E. 2a, E.E. 1, and E.E. 3. Four hours credit. Each semester.

7. Illumination and Photometry. Concepts, quantities, units, and relations employed in this science, such as the lumen, candlepower, foot-candle, lambert; theory and use of typical measuring
devices—precision photometer and accessories, portable photometers, integrating spheres, reflectometers; calculation of illumination from point, line and surface sources of light exhibiting typical distributions of light; light output of any source having symmetrical distribution; calculations regarding light in an enclosure, utilization factor, and flux-of-light method for designing illumination of an interior; laws of vision as they affect lighting; characteristics of lamps, reflectors, enclosing globes; glare and shadow; industrial, office, school, and residence lighting. Two lectures and one three-hour laboratory period. Prerequisite: E.E. 1. Two hours credit. Each semester.

7a. Building Illumination. Illustrations of causes of and means to avoid glare, improper shadows, poor distribution, unsteady light and other faults; means for providing proper illumination for typical interiors such as schools, offices, and residences. This course is designed to acquaint students of public health, factory administration, and architecture with criteria for determining whether the lighting is good or harmful to the eyes. One lecture. Not open to electrical engineering students. One hour credit. Second semester.

9. Directed Research Problems. Special problems are selected for laboratory or library investigation with the intent of developing initiative and resourcefulness. To a large degree the student's own desires will control the subjects investigated. The work differs from that offered in Course 18 in that the instructor is in close touch with the work of the student. Course 9 may be elected by seniors who have suitable preparation. Course 18 is for graduates. Prerequisite: E. E. 3. Credit by arrangement. Each semester.

10. Advanced Theory of Electrical Circuits. Mathematical analysis of theoretical and practical problems; electrical filters; transmission of electric waves on lines having distributed capacitance, inductance, resistance, and leakage; mechanism of reflection at terminals; electromagnetic waves in space; Maxwell's equations. The course material is fundamental to further work in telephone, telegraph, and radio circuits. Lectures. Prerequisites: E. E. 3, and preceded or accompanied by E. E. 17. Three hours credit. Each semester.
11. Power Plants and Transmission Systems—Economics of Design. Elementary principles of corporate finance, study of economic decay and tests for obsolescence; power plant load curves as a basis for design; economic load division between units and plants, economic conductor section and distribution systems; study of plant location; selection of oil circuit breakers; economic use of power limiting reactors, relays, synchronous condensers for power factor control and phase modification; constant voltage transmission lines. Lectures, recitations, and problems. Prerequisite: E.E. 3, or E.E. 2a. Five hours credit. Each semester.

12. Fundamentals of Engineering Electronics. An engineering analysis of the fundamentals of electronic phenomena, with special emphasis on quantitative relationships; ionization, recombination, diffusion, and radiation in conducting gases; photoelectric and thermionic emission. The course is intended to be basic to an understanding of the operation of circuit breakers, high voltage fuses, cables, and lightning arresters, arc welding processes; lightning; glow, corona, and spark discharges. These applications are studied as such as well as being used illustratively throughout. Lectures and discussions. Prerequisites: E.E. 1 and E.E. 2. Two hours credit. Second semester.

15. Advanced Lighting. Selection of a topic, with instructor’s approval, for continued and intensive study, which is pursued either until all sources of information in English are exhausted, or the time of the course is ended; short oral reports by each student to the class each week; written report and bibliography presented to instructor at end of course. Prerequisites: E.E. 7, and preceded or accompanied by E.E. 3. Two hours credit. Second semester.

16. Electrical Rectification. A study of the basic action in alternating current rectification by various types of rectifiers; gaseous ionization and electronic action as applied to rectifiers; wave form analysis of rectifiers under various load conditions; operating conditions and applications. Class library and laboratory study. Individual problems, involving use and study of the oscillograph. Prerequisite: To be preceded or accompanied by E.E. 17. Two hours credit. Second semester.

17. Electromechanics. Analysis of complex alternating current waves; average and effective values; meaning of power factor; the method of the complex variable in a-c problems; the application of differential equations to solutions of simple transients and oscillatory circuits; use of hyperbolic functions in solving the general equation of a circuit containing distributed inductance, capacitance, resistance, and leakage. Lectures and problems. Prerequisite: E. E. 3. Four hours credit. Each semester.
18. Research Work in Electrical Engineering. Students electing the course, while working under the general supervision of a member of the staff, are expected to plan and carry out the work themselves, and to make a report in the form of a thesis. Research. *Elected by permission of Head of Department.* Credit by arrangement. Each semester.

19. Study of Design—Power Plants. Studies of modern typical generating and sub-stations; inspection of steam and hydraulic plants; outline of complete plant design, with detailed design of the bus system, switchboard, relay and exciter plant, etc. Lectures, problems. *Prerequisite: E.E. 11.* Two hours credit. Second semester.

21. Thermionic Vacuum Tubes in Engineering. Study of vacuum tube characteristics and the various factors affecting these characteristics; series, parallel and coupled circuits; resonance; rectification and detection; oscillators; theory and design of amplifiers; dynatron action; special vacuum circuits. Engineering applications will be stressed throughout the course. Lectures and laboratory. *Prerequisite: Preceded or accompanied by E.E. 17.* Three hours credit. First semester.

22. Radio Engineering. Advanced work in resonant, coupled, and oscillatory circuits, based on work done in E.E. 21. Application of these circuits to radio problems. Audio and radio frequency amplification; transmitting and receiving circuits with especial attention to the use of vacuum tubes; antennas and principles of electromagnetic radiation; field measurements; frequency control. Lectures and laboratory. *Prerequisites: E.E. 21 only; or Physics 165 and preceded or accompanied by E.E. 17.* Three hours credit. Second semester.

25. Advanced Principles of Electricity and Magnetism. Advanced theory and problems in electric and magnetic fields, using elementary vector methods which are introduced as required. This work amounts to a broader and continued treatment of the subject matter considered in E.E. 1, leading to Maxwell's Equations and the radiation of energy from electric circuits. In addition, a brief historical sketch of electricity and magnetism is given, followed by a discussion of the influence of the later phys-
ical experiments and theories. **Prerequisites:** E.E. 1, E.E. 3, and permission of the instructor. Credit by arrangement, though ordinarily for three hours. Each semester.

26. **Heaviside Operators.** Advanced theory of electrical engineering, as developed by the application of Heaviside operators to electric circuits. Lectures and discussions. Elected by permission of the instructor. Two hours credit. Each semester.

28. **Technical Electrical Measurements.** Theory and practice in making measurements, particularly in alternating currents, to a precision and accuracy required by modern laboratories. Ratio and phase angle tests of current and potential instrument transformers, and their use with wattmeters and watt-hour meters are considered. Opportunity is provided for working with A. C. bridges and oscillographs of various types. One afternoon of laboratory. Must be preceded or accompanied by Physics 147. One hour credit. Each semester.

33. **Industrial Electrical Engineering.** Individual and group drive by electric motors; selection of motors; power requirements of various kinds of machinery; electric hoists; electric welding; electric furnaces and temperature regulation; electric braking; and other industrial problems. Lectures. Must be preceded or accompanied by E.E. 4. Two hours credit. First semester.

36. **Rates and Cost Analysis.** Capitalization; fair return on investment; analysis of costs and value of electrical energy; customer charge, demand charges, energy charges; investigations of practical systems used in charging for electrical energy. Lectures. Prerequisites: E.E. 11; open to seniors only. One hour credit. Second semester.

51. **Advanced Problems in Electrical Machine Design.** Problems are chosen from material as follows: study of magnetic circuits of rotating machinery; commutation of the d-c machine and the synchronous converter; losses, heating, heat transfer and heat dissipation in machines; study and design of the watt-hour meter; reactance in the induction motor. General conduct of course: reading of assigned papers, working of problems, and discussion with the instructor. Prerequisites: E.E. 5; elected by permission of instructor. Two to four hours, by arrangement. Each semester.

71. **Interior Illumination, Study of Design.** Advanced work in illumination design for graduate students, or for specially qualified and interested seniors. Lecture and laboratory. Elected by permission of the instructor. Two hours credit. First semester.
72. Natural Lighting of Buildings. Methods for prediction of daylight illumination of interiors from windows, and for designing the fenestration of buildings. A complete survey is made of all published and much unpublished information regarding factors which affect daylighting, such as glass in windows, window shades and blinds, color and finish of interior and exterior surfaces of buildings. The course being designed formerly for architects and other than electrical engineers, the essential knowledge about fundamental principles of lighting is treated briefly within the course, for which there are no prerequisites except an ability to work accurately with simple algebra and plane trigonometry. Two hours credit. First semester.

73. Photo-electric Cells and Their Applications. Study of operating characteristics of photo-electric cells and their applications to photometry relays and other uses. Design of photo-electric photometers. Lectures and laboratory work. Prerequisite: Elected by permission of instructor. Two hours credit. First semester.

Summer Session

It is planned to offer Courses 1, 2, 2a, 3, 4, and 18 for the Summer Session of 1930. Courses 5, 7, 11, 17, 25, and 26 may be given if there is sufficient demand. Those wishing to elect any of these should, if possible, communicate with the instructor in charge of the particular course some time before the opening of the Summer School.

Meter School

The Electrical Engineering Department, with the co-operation of the public utilities of the State and of the manufacturers, holds a one-week school for electric metermen during the Spring Recess. Information will be furnished upon application to the Department. This work carries no University credit.

77. ENGINEERING MECHANICS

Professors Patterson, Menefee, Van den Broek, and Timoshenko; Associate Professor Stevens; Assistant Professors Swinton, Olmsted, Liddicoat, Dodge, Franklin, and Donald.

Engineering Mechanics is the subject which, probably more than any other, tests the student's ability to use the technical training given him in preceding courses and at the same time prepares him for what is to follow.

No definition of engineering, from whatever angle given, is complete without some reference to forces. It is in mechanics that the student is given the engineer's conception and methods of handling forces. This is accomplished by—
(a) A general required four-hour course in fundamentals, definitions, and conceptions of the ways in which mathematics, analytical and graphical, may be used with the laws of equilibrium, to solve problems dealing with the various phases of forces, followed by

(b) A required three-hour course on strength and elasticity of materials, supplemented by a one-hour elective course in the laboratory.

(c) A required two-hour course in dynamics, supplemented by a one-hour elective course in the laboratory.

(d) A required three-hour course in hydro-mechanics with a demonstration room for illustrating principles of stream line flow, channel and weirs, pipe flow, orifices, etc.

Library. The general engineering library has books for collateral reading and study in mechanics.

The Physical Testing Laboratory occupies two adjoining large rooms with entrance at Room 102, West Engineering Building. The equipment comprises a 50,000-pound, a 100,000-pound, and a 200,000-pound tension-compression machine, a 230,000-inch pound torsion machine with jaws for taking specimens 2 1/2 inches in diameter, an Olsen impact machine, an Upton Lewis endurance tester, an electrically driven bar bender for bars up to 2 1/2 inches diameter, a Brinell hardness tester, a wire tester, a transverse bending machine for cast iron arbitration bars and other short demonstration beams, a nine-foot transverse bending machine and a power saw and grinder, an electric furnace, a polishing table and wheel with photographic equipment, and cement testing equipment for all standard cement tests.

The special accessory equipment consists of one six element telemeter strain gage, one Huggenberger extensometer, one Martens mirror strain gage, one electrical micrometer gage, one contact micrometer gage, several Berry gages, one vertical and one horizontal portable seismograph.

CURRICULUM IN ENGINEERING MECHANICS AND REQUIREMENTS FOR GRADUATION

The following program leading to the degree of Bachelor of Science in Engineering, Engineering Mechanics, has been provided to meet the increasing demand from industry for graduates with the thorough theoretical grounding in mechanics and mathematics needed to cope with difficult engineering problems of research type.
(a) Preparatory Courses:
- English 1 and 2, and a course from Group 3: 6 hours
- *Modern Language and Cultural Electives: 16 hours
- Mathematics 3, 4, 33, 34: 18 hours
- Physics 45, 46: 10 hours
- Chemistry 5E: 5 hours
- Drawing 1, 2, 3: 8 hours
- Shop 2: 2 hours

Total: 65 hours

(b) Secondary Courses:
- Surveying 4: 2 hours
- Engineering Mechanics 1, 2, 3, 4: 12 hours
- Chemical Engineering 1: 3 hours
- Electrical Engineering 2a: 4 hours
- Civil Engineering 2: 3 hours
- Mechanical Engineering 3: 4 hours

Total: 28 hours

(c) Advanced Courses:
- Technical Group, in some specified technical engineering department, including an advanced design course; approximately: 13 hours
- Engineering Mechanics (advanced): 16 hours
- Mathematics Group: 10 hours
- Electives: 8 hours

Grand Total: 140 hours

The number of hours in the technical, mathematics and elective groups are subject to variation on the advice of the head of the department.

2. Strength and Elasticity of Materials. A study of the application of mathematics and principles of mechanics to solution of problems in stress and strain on engineering materials, including

*Students in this curriculum may satisfy the modern language and cultural requirement by completing Course 31 in both French and German.
resistance to direct force, bending, torque, shear, eccentric load, deflection of beams by area moment method and compounding of simple stresses. Recitations, lectures, and problems. **Prerequisite:** Course 1. Three hours credit. Each semester.

2a. **Laboratory in Strength of Materials.** (Elective.) Experiments with beams, struts, shafts, and engineering materials, supplementing text work. Attendance at laboratory once each week. **Prerequisite:** Course 1. Must be accompanied or preceded by Course 2. One hour credit. Each semester.

3. **Dynamics.** All motions of a particle, dynamics of moving bodies, Newton's Laws, simple harmonic motion, balancing, pendulums, impulse and momentum, gyroscopy, and work and energy. Recitations, lectures, problems. **Prerequisite:** Course 1. Two hours credit. Each semester.

3a. **Experimental Dynamics.** Experiments with acceleration, vibration, balancing, and gyroscopics. One hour laboratory period, with report, each week. Must be preceded or accompanied by Course 3. One hour credit. Each semester.

4. **Hydromechanics.** Pressures, centers of pressure, gages, effects of translation and rotation, Bernoulli's Theorem, orifices, tubes, weirs, pipes, open channels, meters, dynamic action of jets and streams. Recitations, lectures in Hydraulic Demonstration Room, problems. **Prerequisite:** Course 1. Three hours credit. Each semester.

5. **Materials Testing.** (Required only of Architectural Engineers.) History of rapid development of the science; correlation with mechanics; study of testing machines, calibration, and particular function. Written reports, special emphasis on technique of report writing, and graphic presentation and interpretation of data. Laboratory work devoted to tests on steel, iron, wood, brick, and structural materials, including standard cement tests, water ratio theory, voids in sand and gravel, reinforced and unreinforced concrete beams, and granular metric analysis of sand. Lectures, laboratory, reports. **Prerequisite:** Course 2. Two hours credit. Each semester.

7. **Research in Testing Materials.** **Prerequisite:** Course 2. Credit to be arranged. Each semester.

8. **Advanced Dynamics.** Lectures, problems. **Prerequisite:** Course 3. Two hours credit. Each semester.

9. **Advanced Strength of Materials.** Lectures, problems. **Prerequisite:** Course 2, with a grade of B. Three hours credit. Each semester.
10. **Research in Strength of Materials.** Special problems involving laboratory tests, and application of theory in Courses 2, 2a, 3, and 5. Credit to be arranged. Each semester.

10a. **Research in Theory of Elasticity.** Special problems involving application of theory and experimental investigation. Credit to be arranged. Each semester.

10b. **Research in Theory of Structures.** Special problems such as arches, arch dams, suspension bridges, elastic stability of columns and framed structures, impact effect and vibration of bridges. Credit to be arranged. Each semester.

11. **Dynamics.** Two hours of credit in this course applies for credit in Course 3; the remaining hour is credited as advanced studies and demonstrations. **Prerequisite:** Course 1. Three hours credit. Each semester.

12. **Vibration Problems in Engineering.** Vibration of systems with one degree of freedom. Balancing of rotating machines; calculation of critical speeds of rotating shafts; theory of vibration-recording instruments; springs of variable flexibility. Systems with several degrees of freedom, and elastic bodies. Vibration of cars; torsional and lateral vibration of shafts; vibration of beams; vibration of bridges, turbine blades, and turbine discs. **Prerequisite:** Courses 1, 2, and 3, Mathematics 105. Two hours credit. First semester.

14. **Stress Analysis in Machine Parts.** Stress concentration in tension and compression produced by fillets and holes. Photo-elastic method of studying stress concentration. Stresses in shafts of variable cross-section. Stresses due to shrink fit pres-
sure. Stresses in curved bars, theory, and applications. Stresses in fly wheels, rotating discs, and rotors. Critical speeds. Designed principally for students interested in machine design. **Pre-requisite: Course 2.** Two hours credit. Second semester.

15. **Theory of Thin Bars, Thin Plates, and Slabs.** With application to the solution of such problems as bending of beams on elastic foundation and track stresses; combined bending and tension or compression; buckling of solid, tubular, and built-up columns under various conditions; buckling of thin plates, such as flanges and webs of built-up sections, and the web of a plate girder; bending of slabs under various conditions, with application to highway and structural engineering. Designed principally for students interested in structural design. **Prerequisite: Course 2.** Two hours credit. First semester.

16. **Seminar in Theory of Elasticity.** Credit to be arranged. Each semester.

17. **Library Research.** Devoted to the history and development of modern engineering practices. **Prerequisite: Course 1.** One or two hours credit. Each semester.

**Summer Session**

Courses 1, 2, 2a, 3, 4, 5, or similar courses, will be given during the Summer Session of 1930.

78. **GEODESY AND SURVEYING**

Professor JOHNSON; Associate Professors CAREY, BRODIE, and BOUCHARD; Assistant Professors MITCHELL, McFARLAN, and YOUNG; Mr. BLEEKMAN, and Mr. MALDONADO.

**Geodesy and Surveying,** broadly speaking, are the sciences which have to do with the making, recording, and reduction of observations and measurements for determining the relative positions of points on or near the earth's surface. Geodetic theory is applied when the work is influenced by the size and shape of the earth. The practice of plane surveying is confined to small areas.

Geodesy is employed in locating the natural and artificial features of large areas of the earth's surface both on land and at sea. Field data are obtained by a combination of astronomical and terrestrial measurements. These involve precise triangulation systems, level circuits and topographic studies. The physical and mathematical sciences are relied upon, both in the making of observations and in the interpretation of data. Some of the data thus obtained are recorded in condensed form as maps, which are of great practical value in connection with military and com-
mmercial operations. While the main lines of geodetic work are in progress, much information from related fields of science is obtained. Geodetic measurements were made to determine the shape and size of the earth as early as 276 B.C. The science, as we know it today, owes much to Newton, Laplace, Legendre, Gauss and other investigators of the past few centuries. The field is now sufficiently definite and stable to offer attractive opportunities to well-trained men.

Topographic Surveying.—Extensive topographic work is performed by the United States Coast and Geodetic Survey, the United States Geological Survey, and the Corps of Engineers of the Army. Modern city plans are preceded by topographic studies which often include large areas lying beyond the existing municipal limits. Geodetic principles are often applied here.

Boundary Surveying.—The location of boundaries, the placing of monuments, and the filing of permanent records, including notes, computations, maps, etc., is probably the most universal branch of surveying. Every property owner and every political division of the nation has a direct interest in the location of property lines. With the increase in population and in land values, this phase of surveying is becoming more important. The solution of many problems in this field requires a knowledge of geodesy and land law.

Legal and Administrative.—Many problems with which the surveyor is confronted make it necessary that he concern himself with the legal and administrative principles relating to boundary surveying, the registration of land titles, land laws and riparian boundaries.

The Courses offered by the Department aim to give the student of Geodesy and Surveying a fundamental training that will enable him to enter any branch outlined above. In order that the Department may keep in touch with practice and aid graduates in securing employment, it maintains contact with organizations which specialize in surveying work.

The Department of Geodesy and Surveying, one of the oldest departments of the College of Engineering, became by action of the Board of Regents in 1921 a professional department offering a curriculum leading to the degree of Bachelor of Science in Engineering, Geodesy and Surveying. The curriculum provides such training in pure and applied science as may be necessary to interest students in geodetic work, higher surveying, astronomy, and mathematics. Graduate work leading to the professional degree of Geodetic Engineer is done under the direction of the
Graduate School. The Department is convinced that only by the mastery of fundamentals may students develop that proficiency which ultimately stimulates love of work. The Department, representing one of the oldest fields of science, accepts this basic idea as its guiding rule. The aim is to help the individual acquire a foundation upon which he can continue to build in the future, rather than to develop an immediately marketable efficiency. Students of Geodesy and Surveying are therefore urged to choose their elections in such a manner as to broaden and strengthen their foundations in science, pure and applied. They are also encouraged to become interested in the humanistic sciences and philosophy. Even those of the highest scientific attainment are obliged to deal with others, and they should always appreciate their responsibilities to society. The aid of the Department is always available to those students who are in doubt as to electives which would be most helpful to them.

**Equipment for Surveying.**—The equipment for surveying includes transits, levels, rods, tapes, etc., in sufficient number to supply 200 students. Special equipment is provided for triangulation work. Current meters, barometers, hand levels, sextants, cameras for surveying and engineering photography, plane tables for topographic work, and numerous other small engineering and surveying instruments are provided.

**Camp Davis.**—The University of Michigan was the pioneer in the establishment and maintenance of a camp for field work in surveying. The camp was organized under the supervision of the late Professor J. B. Davis in 1874.

There are but few districts east of the Missouri River where field work in surveying is not handicapped by growths of brush and trees or by buildings and other structures. In February, 1929, the University of Michigan purchased lands in Jackson's Hole, Wyoming, for a new camp for surveying work. The new location was occupied for the first time during the following summer. It is in the valley of the Hoback River, twenty miles south and east of the town of Jackson and seventy-five miles south of the Yellowstone Park. An excellent road—U. S. 187—connecting the Lincoln Highway at Rock Springs, Wyoming, with the Yellowstone Park, passes within a mile of the camp site.

The Wyoming lands offer the following advantages: first, an almost unlimited area of open country; second, an adequate supply of water under gravity pressure; third, an ideal climate, with little cloudy weather, no oppressive heat, and cool nights; fourth, proximity to an improved highway which leads to the celebrated Jackson's Hole country, the Yellowstone Park, and to agricultural districts where mess supplies may be purchased; fifth, the beautiful mountains surrounding the valley of the Hoback River in which the
camp is situated, which offer unlimited opportunities for exploration. The camp is within thirty-five miles of the celebrated Teton Mountains and seventy-five miles from the southern boundary of the Yellowstone Park.

All of the buildings at the camp have concrete floors and sheet steel superstructure. In addition to residence buildings, fourteen feet square, larger buildings for general use have been erected. Among these are a dining room and kitchen, a keeper's residence, instrument room, shop, and a garage. Each residence building is furnished with a stationary washbowl, a coal stove, bed and bedding, four chairs and a table. The camp has electric lights, hot and cold showers, and a modern sanitary system.

In 1930 instruction begins on Monday, June 30. Students should reach the camp on the preceding Saturday. Instruction runs for five and one-half days per week for eight weeks. Field conditions are so satisfactory that all instruction may relate to surveys for a single important project. The camp is open to students coming adequately prepared from any college of engineering. Necessary preparatory training with an outline of the work covered at the camp and other information is contained in a special circular which may be obtained upon application. A maximum number of four students will be accepted from any single institution. It is believed that the camp will be more attractive if it has a cosmopolitan atmosphere. Eight hours of credit are given those who complete the regular course, Surveying 3. For those unable to complete a two-hour course in practical astronomy, as a part of their preparation, a second course of two hours, Surveying 6, given at the Camp, must be elected.

Students should be able to complete the camp work at a cost of $200 or less. The University fee is $41. The cost of board is approximately $60. This leaves a balance of practically $100, which should cover round trip transportation costs from almost any part of the United States and leave a balance which would enable students to visit the Yellowstone Park and other points of interest. The estimated cost of travel is made on the assumption that from three to four persons travel together in one car.

Further information may be obtained by writing to Professor C. T. Johnston, 209 West Engineering Building, Ann Arbor, Michigan. Camp Davis mail address is Jackson, Wyoming; freight and express, Victor, Idaho.

Combined Courses have been arranged with Albion, Battle Creek, and Olivet Colleges and the College of the City of Detroit. For detailed information see section 15.

Advice to Students of other colleges and universities with regard to planning their courses before coming to the University is to be found in section 14.
Military Science.—The attention of prospective students in Geodesy and Surveying is called to the Reserve Officers Training Corps. Those who consider taking Military Science are urged to enroll at the beginning of their course. For further details see section 64.

**CURRICULUM IN GEODESY AND SURVEYING AND REQUIREMENTS FOR GRADUATION**

Candidates for the degree of Bachelor of Science in Engineering, Geodesy and Surveying, are required to complete the curriculum detailed below. For the definition of an hour of credit see section 50.

**a) Preparatory Courses:**

- English 1 and 2, and a course from Group 3........ 6 hours
- Language and Cultural Electives.................. 16 hours
- Mathematics 3, 4, 33, 34............................ 18 hours
- Physics 45, 46................................... 10 hours
- Chemistry 5E ....................................... 5 hours
- Drawing 1, 2, 3...................................... 8 hours
- Shop 2, Metal Working............................. 2 hours

Total ........................................ 65 hours

**b) Secondary and Technical Courses:**

- Engineering Mechanics 1, 2, 3, 4.................. 12 hours
- Chemical Engineering 1............................. 3 hours
- Astronomy 31, 35.................................... 5 hours
- Geology 31 .......................................... 3 hours
- Electrical Engineering 2a......................... 4 hours
- Mechanical Engineering 3.......................... 4 hours
- Civil Engineering 2, 2a, 10.......................... 9 hours
- Surveying 1, 2, 3, 5, 21............................. 19 hours
- Geodesy 1 ........................................... 3 hours

Total ........................................ 62 hours

**Summary:**

- Preparatory Courses ................................. 65 hours
- Secondary and Technical Courses.................. 62 hours
- Electives ........................................... 13 hours

Total ............................................. 140 hours

*For modern language requirement see section 51.

†Physical training twice a week throughout the year (without credit in hours) is required of all first-year students, unless Military Science (one hour credit each semester) is elected as a substitute. Military Science is for a period of four semesters.
COURSES IN SURVEYING

1. Surveying. Fundamental theory and practice; note keeping; verniers; linear measurements; angle reading; traverse surveying; computing areas; straight line; circular curves; differential levelling; continuous levelling; profile; grade stakes; vertical curve. Lectures, text assignments, recitations, three four-hour periods of field practice. Required for students of Geodesy and Surveying, Civil Engineering, and Landscape Design. *Prerequisite: Mathematics 4.* Three hours credit. Each semester.

2. Surveying. Topographic field work; stadia; plane table; mapping from transit and plane table notes; theory of cross-sectioning and earthwork calculation; triangulation; adjustment, design, and care of instruments. Lectures, text assignments, recitations, field practice, drawing. Two recitations and two four-hour field or drawing periods. Required for students of Geodesy and Surveying, Civil Engineering, and Landscape Design. *Prerequisite: Surveying 1.* Four hours credit. Each semester.

4. Surveying. Elementary theory and practice; use of instruments; reading verniers and angles; running straight lines; traverse survey; computing areas; levelling; profile; grade stakes; note keeping. Lectures, text assignments, one recitation, and one four-hour field period. Required of all engineering students except Geodesy and Surveying, Civil and Chemical Engineering. *Prerequisite: Mathematics 4.* Two hours credit. Each semester and Summer Session.

5. Least Squares. Theory of least squares; adjustment and comparison of data; computation of triangulation systems; determination of empirical formulae. Lectures, text, problems, recitations. *Prerequisite: Mathematics 4.* Two hours credit. Each semester.

7. Municipal Surveying. Surveys for street location, fixing grades, paving, sewers, property lines; subdivision planning and laying out; state laws relating to municipal surveys. Lectures, text, drawing, one recitation and one four-hour field period. *Prerequisite: Surveying 3.* Two hours credit. Each semester.

12. **Surveying.** Similar to Surveying 1 with drawing work added. Designed for Forestry students. Lectures, text, recitations, field. Three four-hour field periods, and one one-hour drawing period. *Prerequisite: Math. 4.* Four hours credit. First semester.

13. **Surveying.** Similar to Surveying 2. Designed for Forestry students. Lectures, text, two recitations, and two four-hour field or drawing periods. *Prerequisite: Surveying 12.* Four hours credit. Second semester.

21. **Photography and Camera Surveying.** History of photography; testing camera and lenses; exposure of plates; development of negatives; printing, enlarging, and reducing; lantern slides; color work; mapping and field sketching. Lectures, reference work, one recitation, and one four-hour field and laboratory period. *Prerequisites: Surveying 3, Physics 36, and an elementary course in chemistry.* Two hours credit. Each semester.

22. **Advanced Topographic Surveying.** History of the development of topographic methods and practice of foreign countries; status of such surveys in this country; purpose of topographic surveys; use of topographic maps. Lectures, reference work, recitations, problems. *Prerequisite: Surveying 3. Open to fourth and fifth year students only.* Four hours credit. First semester.

23. **Map Projections and Sketching.** Map projections with special reference to the polyconic system; exercises in topographic mapping and sketching. Lectures, reference work, recitations, problems. *Prerequisite: Surveying 3. Open to fourth and fifth year students only.* Three hours credit. First semester.

31. **History of Administrative Departments.** History and organization of national and state departments which conduct extensive surveys. Lectures, reference work. *Prerequisite: Surveying 3. Open to fourth and fifth year students only.* Two hours credit. First semester.

32. **Land Law.** Legislation relating to registration of land titles and estates; acquiring of title to property; essential elements of deeds; application. Lectures, reference work. *Prerequisite: Surveying 3. Open to fourth and fifth year students only.* Three hours credit. First semester.

33. **Land Law.** Law of boundaries; adverse possession; prescription and prescriptive rights; easements and rights of way. Lectures, reference work. *Prerequisite: Surveying 32. Open to fourth and fifth year students only.* Three hours credit. Second semester.
34. Registration of Land Titles. Legislation relating to the registration of land titles; Torrens Act of Australia and modifications as adapted to conditions of other countries. Lectures, reference work. Prerequisite: Surveying 3. Open to fourth and fifth year students only. Three hours credit. Second semester.

35. Boundary Surveys. Boundary surveys from a legal standpoint; boundary surveys in this country and abroad; problems relating to the establishment of boundaries uncertain, due to obliteration of monuments, errors in surveys, inaccurate descriptions in deeds or to other causes. Lectures, reference work. Prerequisite: Surveying 3. Open to fourth and fifth year students only. Three hours credit. Second semester.

36. Riparian Boundaries. Uncertainty of riparian boundaries as now defined by court decision under the Common Law; method of definite determination of riparian boundaries. Lectures, reference work. Prerequisite: Surveying 3. Open to fourth and fifth year students only. Three hours credit. Second semester.

COURSES IN GEODESY

1. Geodesy. Introductory course; history; elements of modern practice and its application to several branches of surveying. Lectures, text, recitations. Prerequisite: Surveying 3. Open to fourth and fifth year students only. Three hours credit. Second semester.

2. Geodesy. Methods employed and field covered by the United States Coast and Geodetic Survey. Lectures, reference work. Prerequisite: Geodesy 1. Open to fourth and fifth year students only. Two hours credit. Second semester.

Summer Session

3. Surveying. Adjustment of instruments; astronomical applications, time, azimuth, latitude, and longitude; lines of communication, circular and easement curves, profiles, topography, grades, cross-sections; baseline measurement; triangulation; Public Land surveys; topography; project surveys; computation of field data; making of maps and diagrams; preparation of permanent records of work performed; camp construction and maintenance and many things which relate to the welfare of those who live in the open. Field problems, office work, five and one-half days a week. Prerequisites: Surveying 1 and 2, or 12 and 13; Astronomy 35. See page 187 (relating to fees). Eight hours credit. Summer camp.

4s. Surveying. Use of instruments, same as Surveying 4; given at Ann Arbor. Lectures, text, one recitation, and one four-
hour field period. *Prerequisite*: Mathematics 4. Two hours credit. Summer Session.

**6. Surveying.** Given only at Camp Davis. Credit two to eight hours depending upon the character of the work.

**79. MATHEMATICS**

Professor James W. Glover, Chairman

Complete offerings of the Department of Mathematics will be found in the special bulletin published by the Department of Mathematics, which may be obtained from any University officer and, particularly, from Professor James W. Glover.

The object of the work of this Department in the College of Engineering is not only to impart to the student the mathematical knowledge requisite for the study of the various branches of engineering, but also to train his mind in the methods of precise reasoning and accustom him to the proper application of general principles to particular cases.

Much time is devoted to the solution of problems in order to combine a fair knowledge of the elementary principles of higher mathematics with the necessary facility in applying these principles to concrete cases. The classes are divided into sections as small as practicable, so as to make it possible for the instructor to give his individual attention to the students.

For students who desire to pursue their mathematical studies beyond the required work, a considerable number of advanced elective courses are offered. Following are the courses offered in the College of Engineering for the year 1930-1931. Additional courses offered in the College of Literature, Science, and the Arts will be found in the Announcement of that College, or in the Announcement of the Graduate School.

The required work is the same for all students of engineering, except students of chemical engineering, and extends throughout the first two years. The first year is devoted to advanced algebra, and plane and solid analytic geometry; the second, to differential and integral calculus, including an introduction to the solution of differential equations. Students who do not have credit in trigonometry are required to complete this subject as early as possible.

There is an increasing demand in the engineering industries and in the faculties of technical schools for graduates who have taken considerably more mathematics and mechanics than is required in the other engineering curricula. To meet this demand, the following program has been provided:
CURRICULUM IN MATHEMATICS AND REQUIREMENTS FOR GRADUATION

Candidates for the degree of Bachelor of Science in Engineering, Mathematics, are required to complete the following program of studies:

a) Preparatory Courses:
   - English 1 and 2, and a course from Group 3 6 hours
   - *Modern Language and Cultural Electives 16 hours
   - Mathematics 3, 4, 33, 34 18 hours
   - Physics 45, 46 10 hours
   - Chemistry 5E 5 hours
   - Drawing 1, 2, 3 8 hours
   - Shop 2 2 hours
   
   Total 65 hours

b) †Secondary Courses:
   - Astronomy 3 2 hours
   - Surveying 1 3 hours
   - Engineering Mechanics 1, 2, 3, 4 12 hours
   - Chemical Engineering 1 3 hours
   - Electrical Engineering 2a 4 hours
   - Civil Engineering 2 3 hours
   - Mechanical Engineering 3 4 hours
   
   Total 31 hours

c) Advanced Courses:
   - Technical Group, in some specified technical engineering department including an advanced design course or advanced courses in technical mechanics (Approx.) 15 hours
   - Mathematics Group (Approx.) 12 hours
   - *Electives 8 hours
   - Group Options in Engineering Mechanics, Astronomy, Physics, Mathematics, or Technical Engineering 9 hours
   
   Total 140 hours

*Students in this curriculum may satisfy the modern language and cultural requirement in the College of Engineering in the usual way, or they may elect twelve hours each of French and German.
†Students in Chemical Engineering who wish to become candidates also in Mathematics are permitted to substitute for Astronomy 3, Engineering Mechanics 3 and 4, Surveying 1 and Civil Engineering 2, such other courses as may be approved by the Department of Mathematics. For students pursuing a program leading to a technical degree in Engineering simultaneously with the program in Mathematics, Surveying 4 may be substituted for Surveying 1.
MATHEMATICS

COURSES IN MATHEMATICS

*3 (Formerly 1). Algebra and Analytic Geometry. Review of exponents, radicals, quadratic equations, systems of equations involving quadratics; theory of equations including Horner's method; determinants; complex numbers; curve tracing and locus problems in Cartesian and polar co-ordinates; straight line; circle. Four hours credit. Each semester.

4 (Formerly 2). Plane and Solid Analytic Geometry. Conic sections; change of axes; properties of conics involving tangents, diameters, asymptotes, parametric equations; surface tracing and locus problems in space; direction cosines; plane; straight line; quadric surfaces; space curves. Four hours credit. Each semester.

*7 (Formerly 1b). Algebra and Trigonometry. Review of elementary operations; factoring, fractions; linear equations in one unknown; simultaneous linear equations; exponents; radicals; quadratic equations; systems of equations involving quadratics; progressions; binomial theorem; trigonometry, the same as in Course 8. Four hours for two hours credit. Each semester.

*8 (Formerly 1a). Trigonometry. Radian measure; coordinate system; trigonometric ratios; trigonometric identities and equations; inverse functions; graphs; reduction and addition formulas; laws of sines, cosines, and tangents; theory and use of logarithms; orthogonal projections; solution of triangles. Two hours credit. Each semester.

9 (Formerly 2a). Solid Analytic Geometry. Surface tracing and locus problems in space; direction cosines; plane; straight line; quadric surfaces; space curves. Two hours credit. First semester.

33 (Formerly 3). Calculus. Functions; limits; continuity; derivative; differential; differentiation and integration of the elementary functions, with applications to curve tracing, maxima and minima, time rates, curvature, plane motion; indeterminate forms; definite and improper integrals. Five hours credit. Each semester.

34 (Formerly 4). Calculus and Differential Equations. Topics the same as in Courses 38 and 39 combined. Five hours credit. Each semester.

*Students entering with credit in trigonometry will take Course 3. Students entering without trigonometry will take Course 7, except that those whose high school records show unusual proficiency in Mathematics may take Courses 3 and 8 instead. Permission to do this must be obtained from the Department of Mathematics at the time of classification.
38 (Formerly 4a). Calculus. Definite integral as the limit of a sum; applications to geometry, centroids, moments of inertia, fluid pressure; infinite series, including Taylor's series; partial and total differentiation, multiple integrals. Three hours credit. Each semester.

39 (Formerly 4b). Differential Equations. Simple types of ordinary equations of the first and second order; linear equations with constant co-efficients; applications to geometry and mechanics. Two hours credit. Each semester.

51. Mathematics of Finance. The elementary theory of compound interest functions is developed as a preliminary to the solution of practical problems in annuities, sinking funds, depreciation, amortization, building and loan associations, capitalized cost and replacement, and the valuation of various types of contracts, bonds, and other securities. Systematic and accurate computation with the use of compound interest and seven place logarithmic tables is stressed throughout the course. Three hours credit. Each semester.

109. Differential Equations for Chemical Engineers. Solutions of equations arising from first order, second order, and simultaneous processes; determination of velocity constants. Graphical methods are stressed. Three hours credit. First semester.

141. Analytic Mechanics. An introduction to theoretical mechanics and to vector methods in mechanics. No previous knowledge of vectors is assumed, the fundamental portions of vector analysis being developed as required in the study of the following topics in mechanics: rectilinear and curvilinear motion of a point; velocities and accelerations in the rigid body; relative motion; statics of a rigid body. Three hours credit. First semester.
142. **Analytic Mechanics.** Continuation of Course 141. Continued study of theoretical mechanics by vector methods. The differential and integral vector operations developed and employed in the study of theory of attractive forces; free and constrained motion of a particle; free and constrained motion of a rigid body; general principles of mechanics. Three hours credit. Second semester.

145. **Celestial Mechanics.** Rectilinear motion of a particle; gravitational theory of the sun's heat; central forces; potential and attraction of bodies; problem of two bodies. Three hours credit. First semester.

146. **Celestial Mechanics.** Problems of three and n bodies; geometric introduction to the lunar theory; general perturbations; introduction to periodic orbits. Three hours credit. Second semester.

169. **Graphical Methods.** Graphical representation of functions; construction of graphical charts; graphical solution of equations; a study of the principles of differential and integral calculus by graphical methods applied to the solution of differential equations. Two hours credit. First semester.

170. **Empirical Formulas.** Curve fitting; graphical determination of constants in empirical formulas; application of the method of least squares; interpolation; numerical integration. Two hours credit. Second semester.

175. **Theory of the Potential.** Newtonian attraction, Newtonian and logarithmic potentials, the equations of Laplace and Poisson, harmonic functions, the principle of Dirichlet, the problems of Dirichlet and Neumann and the Green function. Three hours credit. First semester.

176. **Vector Analysis.** A study of the formal processes of vector analysis, followed by applications to problems in mechanics and geometry. Three hours credit. Each semester.

177. **The Theory of Elasticity.** This is a general course in the elastic solid theory. It will be adjusted to the preparation and maturity of the students. Two hours credit. First semester.

178. **Hydrodynamics.** This is a general course in hydrodynamics. The subject matter will be chosen subject to the interest and ability of the students. Two hours credit. Second semester.

201, 202. **Theory of Functions of a Complex Variable.** Properties and manipulation of complex numbers; functions of a
complex variable, their differentiation and integration and related theorems; developments in power series; properties of analytic functions; singularities; and similar topics; applications to mathematical physics and to other branches of mathematics. Three hours credit each. Throughout the year.

210. Fourier's Series and Harmonic Analysis. The development of Fourier's series, Legendre's coefficients, and Bessel's functions, and their applications to certain problems in mathematical physics. Three hours credit. First semester.

241. Applied Mathematics—Engineering Problems. The problem will first be formulated mathematically and then the necessary mathematical theory for a solution will be developed. The problems will be so selected that their solution will cover a wide field mathematically; such as ordinary and partial differential equations, difference equations, harmonic analysis, and approximate solutions. Three hours credit. First semester.
245, 246. **Advanced Celestial Mechanics.** Studies in continuation of Course 146 will be arranged for those qualified to take them, analytic differential equations with applications to periodic orbits, cosmogony and stellar dynamics, lunar theory, and research in mathematical astronomy. Two hours credit each. Throughout the year.

**Summer Session**

The following or similar courses will be offered in the Summer Session of 1930: 3, 4, 33, 34, 141s, 145, 169, 170, 201, and 241.

80. **MECHANICAL ENGINEERING**

*Professors Anderson, Bursley, Emswiler, Wilson, Fessenden, and Hawley; Associate Professors Lay, Sherzer, Keeler, and Nickelsen; Assistant Professors Mickle, Watson, Gordy, Lloyd, Hollis, Good, Kessler, Marin, and Calhoon; Mr. Jensen.*

**Mechanical Engineering** is that branch of engineering which broadly speaking covers the fields of heat, power, design of machinery, industrial management, and manufacturing problems. Mechanical Engineering may be divided into the following branches:

**Steam Power Engineering** deals with the theory, design, construction, and operation of the various forms of prime movers using steam as the motive power, and their applications in the modern power house. The problems of combustion of fuels, the application of power and steam in industrial plants, determination of power costs, and similar subjects, may be included under this heading. This branch is so closely allied with electric power engineering that a knowledge of both is essential to the practicing engineer in this field.

**Internal Combustion Engineering** covers the design, construction, and operation of the various types of engines using gas, oil, or gasoline, to generate the motive power; the different types of gas producers, and the application of this form of engine to the generation of power for many purposes. Because of the present day use of the automobile, the increased cost of coal, and the development of the oil industry, the field has become very important in recent years.

**Hydro-Mechanical Engineering** deals with the theory, design, construction, installation, testing, and operation of water wheels, water turbines, centrifugal, and reciprocating pumps. This is one of the oldest branches of Mechanical Engineering and one of the most important.
Heating, Ventilating, and Refrigerating Engineering are included under one general heading because of the similarity in the type of problem involved. Broadly speaking, this group includes the theory, design, installation, and operation of heating, ventilating, and refrigerating plants. Among the specific applications would be the heating and ventilating requirements of buildings for various uses. Problems relating to compressed air are also considered in this group.

Automobile Engineering.—The University of Michigan has a strategic location at the center of the automobile industry in this country, and particular attention has been directed toward the development of courses in this branch of engineering. Work in this field covers the general principles of operation, theory and design of the automobile engine and other chassis units, laboratory and road tests of the various component parts of the automobile or of the complete automobile itself.

Industrial Engineering deals with industrial plant operation and management, efficiency and safety methods, production, and the business side of manufacturing. This branch of engineering, while old in principle, has not been generally recognized until recent years, but now commands an important place in the engineering field.

Machine Design.—While design is included in practically all branches of Mechanical Engineering, and is therefore a necessary adjunct to those branches, there is also the general field for the man who wishes to follow machine design either as technical designer or as manufacturer of general machinery. The very general application of automatic machinery to manufacturing methods has established a definite need for good designers.

The Department of Mechanical Engineering of this University endeavors to give the student a thorough training in the fundamental principles of the basic mechanical engineering subjects. Most of the time of the first two years, and a part of the third year, is spent in a study of the foundation courses such as Mathematics, English, Physics, Chemistry, Drawing, and Mechanics. In the third and fourth years, required courses in Heat Engines, Machine Design, Mechanical Laboratory, Thermodynamics, Hydraulics, and Power Plants supplement the foundation courses. The Department recognizes the fact that no student can properly expect to specialize in any branch of engineering in four years of college work. The fourth year, however, allows some opportunity, if desired, for selection of special courses in one or more of the mechanical engineering branches. Graduate work is encouraged, and a number of advanced courses are offered for those who plan
to spend more than four years, or for graduate students from this and from other universities. It has been the policy of this Department to keep in close touch with the actual needs of the graduate student, and as far as possible to give him the training that will fit him for the immediate future. Most of our graduates are absorbed immediately by the industries, and a friendly relation of mutual benefit is always maintained with these industries. Many students come to us with advanced credit, and these are urged to elect courses in several departments of the Engineering College, and also in the College of Literature, Science, and the Arts. Graduate mechanical engineers very rapidly rise to positions of responsibility in the industries, and a broad general course as well as a technical course is of great value to them in their advancement.

FACILITIES FOR INSTRUCTION

It is recognized by this Department that the principal benefits to be derived from a college training are dependent more upon the character of the instruction than upon physical equipment. The importance of certain apparatus for purposes of illustration, demonstration, and testing is however apparent in some lines of work, and the Department aims to include a sufficient amount of laboratory instruction to supplement properly the work of the classroom.

The Mechanical Engineering Laboratory is located in the West Engineering Building and has a floor space of approximately 13,000 square feet. It is devoted to experimental work in connection with the testing of engines, boilers, pumps, fans, air compressors, hydraulic machinery, and automobile engines. The very complete and modern Washington Street power plant of the University (for description see section 41) is available for use, and a test of this plant constitutes a regular part of the second course in Mechanical Laboratory. Occasionally tests are made of outside plants in the vicinity of Ann Arbor.

The laboratory, as a whole, comprises all the equipment utilized for illustration of the theory involved in Mechanical Engineering and for experimental work of both standard and research nature. The laboratory is well equipped with power machines of all kinds, which furnish the means of instruction in the principles of testing. Separate laboratory instruction is given along the lines of automotive work, and that part of the equipment applying especially to this division is segregated to form the automotive division of the laboratory.

For hydro-mechanical work the laboratory is equipped with a pair of 600-cubic-foot tanks on scales, a large Duplex pump, a Francis turbine, a Doble tangential water wheel, two Rees Roturbo pumps, two three-inch single-stage centrifugal pumps, one 50-h.p.
Sprague electric dynamometer arranged for direct connection to centrifugal pumps, and all necessary accessories for testing.

**The Automobile Laboratory** consists of an engine testing section, a dynamometer room, and a section for the display and demonstration of automobiles, motor trucks, and their component parts. The engine testing section contains a complete equipment of engines, selected with a view to affording the student experience with various typical successful types. This section is equipped with prony brakes, water dynamometers, and one fan dynamometer. The dynamometer room contains a complete Diehl electric dynamometer and a 100-h.p. Sprague electric dynamometer, together with special fuel measuring devices, tachometers, air meters, pyrometers, gas analysis apparatus, manograph, and complete accessories necessary for instructional testing and advance research work. In the display and demonstration section are gathered together complete operating and cut-out chassis, various types of engines, cut-out transmissions, rear axles, differentials, clutches, carburetors, ignition systems, and other automobile parts and equipment. This apparatus is especially mounted to show its operation and design, and is used as demonstration study and test equipment for the regular automobile courses. It further serves as a permanent educational exhibit open to the public.

**Combined Courses** have been arranged with Albion, Battle Creek, and Olivet Colleges, and the College of the City of Detroit. For detailed information see section 15.

**Advice to Students** of other colleges and universities, with regard to planning their courses before coming to the University, is to be found in section 14.

**Military Science and Tactics.**—Students who plan to take courses in Military Science are urged to enroll in the beginning of the freshman year, and in doing so should consult with the officer in charge of this Department, and also with the head of the department in which he proposes to take his degree. For information regarding the work in Military Science and Tactics see section 64.

**CURRICULUM IN MECHANICAL ENGINEERING AND REQUIREMENTS FOR GRADUATION**

Candidates for the degree of Bachelor of Science in Engineering, Mechanical Engineering, are required to complete the four-year curriculum detailed on page 204.

Candidates for the degree of Bachelor of Science in Engineering, Mechanical and Industrial Engineering, are required to complete the five year-curriculum detailed on page 206.

For the definition of an hour of credit see section 50.
a) Outline of Required Courses, Four-Year Curriculum

(1) Preparatory Courses:
- English 1 and 2, and a course from Group 3 .... 6 hours
- Modern Languages or Cultural Electives .... 16 hours
- Mathematics 3, 4, 33, 34 ................. 18 hours
- Physics 45, 46 ......................... 10 hours
- Chemistry 5E ................................... 5 hours
- Drawing and Descriptive Geometry 1, 2, 3 .... 8 hours
- Shop 2, Metal Working and Treating ........ 2 hours
- Shop 3, Foundry ................................. 4 hours
- Shop 4, Machine Shop .......................... 4 hours

Total ......................................... 73 hours

(2) Secondary and Technical Courses:
- Surveying 4, Use of Instruments .......... 2 hours
- Eng. Mech. 1, Statics .......................... 4 hours
- Eng. Mech. 2, Strength and Elasticity .... 3 hours
- Eng. Mech. 3, Dynamics .................... 2 hours
- Eng. Mech. 4, Hydromechanics ............ 3 hours
- Mech. Eng. 2, Elements of Machine Design .. 3 hours
- Mech. Eng. 3, Heat Engines ............... 4 hours
- Mech. Eng. 4, Hydraulic Machinery ....... 3 hours
- Mech. Eng. 5, Thermodynamics ........... 3 hours
- Mech. Eng. 6, Machine Design ............. 4 hours
- Mech. Eng. 7, Laboratory, First Course ... 2 hours
- Mech. Eng. 8, Laboratory, Second Course . 3 hours
- Mech. Eng. 9, Power Plants ............... 3 hours
- Mech. Eng. 10, Theory of Machine Movements 2 hours
- Civil Eng. 2, Theory of Structures ....... 3 hours
- Elec. Eng. 2a, D.C. App. and Cir. ........ 4 hours
- Chem. Eng. 1, Engineering Materials ...... 3 hours
- Chem. Eng. 10, Exam. of Gas and Fuel ..... 1 hour

Total ......................................... 52 hours

Summary:
- Preparatory Courses ....................... 73 hours
- Secondary and Technical Courses ......... 52 hours
- Electives .................................. 15 hours

Total ........................................ 140 hours

b) Selection of Elective Courses
The 15 hours of elective work is to be filled partly by "Restricted Electives" and partly by "Free Electives."
(1) Restricted Electives:

The student must elect one 3-hour design course from the following list: M.E. 9a, 11a, 12a, 15a, 16a, 17a, 20a, 25a, 30a, 31a. Of this group, Course 15a must be preceded or accompanied by 15. Courses 30a and 31a must be preceded by the corresponding classroom course and by M.E. 29.

Students who elect a design course other than M.E. 15a, 30a, or 31a, must also offer credit for graduation in some additional mechanical engineering course from the following list:

M.E. 11, 12, 13, 15, 16, 17, 19, 20, 25, 30, 31, 35, 55.

(2) Free Electives:

The remaining elective hours may be filled by courses offered by any department in the Engineering College or by any College or School in the University to which the student is eligible, subject to the approval of the Head of the Mechanical Engineering Department.

In the selection of his elective hours the student is urged to broaden his training by making elections in other departments of work, and in so doing should consult freely with the members of the Mechanical Engineering staff.

*For Modern Language requirement see section 51.*
2. **Elements of Machine Design.** This course covers the practical application of theory to elementary machine design and includes riveted joints, keys and cotters, screw fastenings, power screws, shafts, permanent couplings, journals and bearings, and spur gearing. Two recitations, and one three-hour drawing period a week. *Prerequisites: Drawing 3, and preceded or accompanied by E.M. 2.* Three hours credit. Each semester.

2a. **Elements of Machine Design.** Same as Course 2 but in addition includes belts, ropes, chains, brakes, and clutches. Two recitations, and one three-hour drawing period a week. *Prerequisites: Drawing 3 and E.M. 2. Not open to Mechanical Engineering students.* Three hours credit. Each semester.

3. **Heat Engines.** General principles involved in the action of the various forms of heat engines, including the steam engine and boiler, the steam turbine, and the internal combustion engine with special attention given to the different types in use; the general problem of a modern power plant is considered for the benefit of those who do not devote further time to the subject. Required of all engineering students. Lectures, recitations. *Prerequisites: Physics 45 and 46, and Math. 33.* Four hours credit. Each semester.

3a. **Mechanical Engineering Laboratory.** An elective course for students who are not required to take M.E. 7, intended to give an insight into methods of testing and to exemplify some of the principles of power engineering. *Must be preceded or accompanied by M.E. 3.* One hour credit. Each semester.

4. **Hydraulic Machinery.** General consideration of the theory, construction, and operation of principal types of hydraulic machinery. Lectures, problems and written recitations. *Prerequisite: preceded or accompanied by E.M. 4.* Three hours credit. Each semester.

5. **Thermodynamics.** Principles of energy transformation in steam and air (internal combustion) heat engines, air compressors, and refrigerating apparatus. Lectures, recitations. *Prerequisite: M.E. 3.* Three hours credit. Each semester.

6. **Theory of Machine Design.** Continuation of Course 2 but more advanced in character and covers the analysis of loads and forces, the design of parts, considering wear, dynamic and static forces including critical speeds, and the application of the theory of elasticity. Two recitations, and two three-hour drawing periods a week. *Prerequisites: M.E. 2, and preceded or accompanied by M.E. 10.* Four hours credit. Each semester.
7. Mechanical Engineering Laboratory. First Course. This course includes elementary tests of a steam engine, steam turbine, gas or oil engine, power pump, and steam boiler. The use and calibration of instruments used in mechanical engineering work exemplified in connection with these tests and in the calculation of the results. Laboratory, computations, reports; two periods of four and one-half hours each a week. Prerequisites: E.M. 1, preceded or accompanied by M.E. 3, and accompanied by Ch.E. 10. Two hours credit. Each semester.

8. Mechanical Engineering Laboratory. Second Course. Experimental study of a steam turbine, a Diesel engine, fan, steam injector, air compressor, refrigerating machine, steam power plant, and several forms of hydraulic machinery. Laboratory, computations, reports; two periods of four and one-half hours each a week. Prerequisites: M.E. 7 and preceded or accompanied by M.E. 5. Three hours credit. Each semester.

9. Power Plants. A study of the engineering, operation, and economics of power plants. Lectures, recitations, and problems. Prerequisites: M.E. 3, and preceded or accompanied by E.M. 4. Open only to seniors and graduates. Three hours credit. Each semester.

9a. Design of Power Plants. The student is given the usual data furnished the engineer, with which he makes a study of and selects the proper machinery to meet the needs of a power house. The drafting room work consists of the general design of the power house, including setting and piping plans for all the principal machines to be installed. Computations and drawing; two four-hour periods a week. Prerequisites: M.E. 9 and E.M. 4. Three hours credit. Second semester.

10. Theory of Machine Movements. This course covers gear trains, linkages, cams, intermittent motions, instantaneous centers, periodic centers, and acceleration. Lectures, recitations, drawing; two three-hour periods a week. Prerequisites: E.M. 3 and preceded or accompanied by M.E. 2. Two hours credit. Each semester.

11. Steam Boilers. A study of commercial types of boilers, stokers, and superheaters; principles of boiler economy and operation; combustion of fuels; theory of heat transference; purchase of coal by specifications; storage of coal; feed water treatment; problems of design. Lectures, recitations, problems. Prerequisite: M.E. 3. Three hours credit. First semester.

11a. Design of Steam Boilers. This course covers the design of boilers of different types, including calculations and draw-
ing of important details. Drawing, problems; two four-hour periods a week. Prerequisite: M.E. 6. Three hours credit. Second semester.

12. **Steam Reciprocating Engines.** A study of the general theory and thermodynamics of the steam engine; the various commercial types, and problems on design. Lectures, recitations, problems. Prerequisite: M.E. 5. Two hours credit. Second semester.

12a. **Design of Reciprocating Steam Engines.** Complete design of a steam engine; including the calculation and drawing of important details. Drawing, problems; two four-hour periods a week. Prerequisite: M.E. 6. Three hours credit. Second semester.

13. **Steam Turbines.** A course in the advanced study of the flow of fluids, kinetic effects, thermodynamics, with the steam turbine used as a concrete example. Attention is given to the influence of vacuum, pressure, and superheat; stage bleeding; the bleeder turbine; governing; and the field of application of the turbine. Lectures, recitations, problems. Prerequisite: M.E. 5. Three hours credit. Each semester.

15. **Internal Combustion Engines.** Underlying theory; thermodynamics; fuels and combustion; different commercial types; carburetion; ignition; injection; cooling; regulating devices; testing; computations for principal dimensions; details of construction. Lectures, recitations, problems. Prerequisites: M.E. 5 and preceded or accompanied by M.E. 6. Three hours credit. Each semester.

15a. **Design of Internal Combustion Engines.** This course includes the calculations, the design of important details, and layout drawings of a standard type of internal combustion engine. Drawing, problems; two four-hour periods a week. Prerequisites: M.E. 6 and preceded or accompanied by M.E. 15. Three hours credit. Second semester.

16. **Water Turbines.** A course covering the hydrodynamic theory of the operation of the various types of water turbines. Considerable attention is given to the analysis of test data and the selection of turbines for various operating conditions. Lectures, recitations, problems. Prerequisite: preceded or accompanied by M.E. 4. Three hours credit. First semester.

16a. **Design of Water Turbines.** This course includes calculations and drawings for runners, guide vanes, draft tubes, etc., with special attention given to the layout of runners. Two four-
MECHANICAL ENGINEERING

hour periods a week. **Prerequisite:** M.E. 6. Three hours credit. Second semester.

17. **Pumping Machinery.** An advanced course covering the theory and operation of reciprocating and centrifugal pumps, the application of pumps to definite pumping problems, economic considerations, and graphical methods. Lectures, recitations, problems. **Prerequisite:** M.E. 4. Three hours credit. Second semester.

17a. **Design of Pumping Machinery.** This course includes calculations and drawings for a centrifugal or reciprocating pump. Special attention is given to the design of runners, casings and valves. Two four-hour periods a week. **Prerequisites:** M.E. 4 and M.E. 6. Preferably accompanied by M.E. 17. Three hours credit. Second semester.

18. **Heating and Ventilation.** A study of the theory, design, and construction of hot air, direct and indirect steam, hot water and fan heating systems, air conditioning, and temperature control. Lectures, recitations. **For Architects only.** Two hours credit. First semester.

19. **Refrigeration and Compressed Air.** Application of theories of thermodynamics to refrigeration and compressed air; study of constructive details of refrigeration plants and compressed air systems; operation. Lectures, recitations, problems. **Prerequisite:** M.E. 5. Three hours credit. Second semester.

20. **Mechanical Handling of Materials.** A study of cranes and derricks, hand and electric travelers, inclined and vertical hoisting, haulage systems, aerial and surface cableways, and conveyors of all classes and their application to various classes of plants, processes, and materials. Lectures, recitations, problems, reports, and inspection of systems in use. **Prerequisites:** M.E. 2 and E.M. 2. Two hours credit. Each semester.

20a. **Design of Hoisting and Conveying Machinery.** Calculations and layout work on hoists, cranes, and conveyors. Two four-hour periods a week. **Prerequisite:** M.E. 6. Three hours credit. Each semester.

21a. **Design of Machine Tools.** Complete layout of a modern machine tool; magnitude and direction of forces acting on cutting tools calculated, and all parts of machine proportioned to resist these forces. Investigations of special metal-working processes and machinery may be undertaken. Drawing, problems. Two four-hour periods a week. **Prerequisite:** M.E. 6. Three hours credit. Second semester.
22. Research in the Mechanical Laboratory. Opportunity for advanced experimental study along any line of work in which student may be specializing; consists of investigations for securing data on more difficult problems of mechanical engineering; student left largely to own resources in planning and carrying out work. Laboratory. *Prerequisite: M.E. 8.* Two or three hours credit. Each semester.

23. Hydraulic Machinery. Opportunity for advanced experimental study along any line of work in which student may be specializing; consists of investigations for securing data on more difficult problems of hydro-mechanical engineering; student left largely to own resources in planning and carrying out work. Laboratory. *Prerequisite: M.E. 4.* Two or three hours credit. Each semester.

25. Heating and Ventilation. Theory, design, and installation of hot air, direct and indirect steam, hot water, and fan heating systems; central heating; air conditioning. Lectures, recitations. *Prerequisite: M.E. 3.* Two hours credit. Second semester.

25a. Design of Heating and Ventilating Systems. The student is given the usual data furnished the heating and ventilating engineer. He then makes a layout of piping, ducts, auxiliary apparatus with computations for the size of principal parts. Two four-hour periods a week. *Prerequisite: M.E. 3.* Two hours credit. Second semester.

29. Automobile and Motor Trucks. Fundamental principles of construction, operation; application in current practice; engine cycle, details of construction, cooling, lubrication, carburetion, electrical systems, clutch, transmission, axle, differential, steering, springs, brakes; engine and car testing, performance curves, operation and control. Lectures, recitations, laboratory demonstrations. *Not open to freshmen.* Three hours credit. Each semester.

30. Automobile and Truck Engines. The student selects the type of car or truck; makes expectancy curves for engine performance; then computes and sketches principal parts. Lectures, problems, drawing. Two four-hour periods a week. *Prerequisites: M.E. 6 and 29.* Three hours credit. First semester.

31. Design of Automobile and Motor Truck Chassis. The student selects the type of engine for assumed conditions, then computes and sketches the principal parts of the chassis. Lectures, problems, drawing. Prerequisites: M.E. 6 and 29. Three hours credit. First semester.

32. Automotive Laboratory. An experimental study of engine construction, horsepower, fuel economy, thermal efficiency, mechanical efficiency, heat balance, indicator cards, carburetion, and electrical systems. Road tests of car performance includes speed range, acceleration, braking, and fuel mileage. Laboratory, reports. Two periods of four and one-half hours each a week. Prerequisites: M.E. 7 and M.E. 29. Three hours credit. Each semester.

33. Advanced Automobile Testing and Research. An opportunity for advanced experimental and research work. The student is left largely to his own resources in planning apparatus and in carrying out the work. Laboratory, reports. Prerequisite: M.E. 32. Two or three hours credit. Each semester.

34. Advanced Automobile Design and Research. Special problems in the design of some automobile or truck unit. Drawing. Prerequisites: M.E. 30 and 31. Credit and hours to be arranged. Each semester.

35. Factory Management. A study of the application of the scientific method to the operation of the shop and other departments of a factory; including organization methods and problems, job analysis, wages, production control, personnel, costs, inventory control, etc. Lectures, recitations, reports, field trips. Not open to freshmen or sophomores. Three hours credit. Each semester.

36. Factory Management—Purchasing and Traffic. This course treats of the principles of purchasing material and the relation of this function to other functions in a business. A study is made of the economic aspects of freight transportation, including rates, privileges, and claims. Prerequisite: M.E. 35. Three hours credit. Second semester.

37. Special Topics on the Internal Combustion Engine. This course is designed to bring students in touch with latest developments in theory, design and construction. Reading, reports. Prerequisite: M.E. 15. Two hours credit. Each semester.
38. **Internal Combustion Engineering.** Research work on internal combustion engines. Laboratory. *Prerequisites:* M.E. 8 and 15. Credit and hours to be arranged. Each semester.

39. **Internal Combustion Engineering.** Research design of parts or units requiring special study. Drawing. *Prerequisite:* M.E. 15a. Credit and hours to be arranged. Each semester.

40. **Factory Management, Field Work.** Lectures and problems are presented by prominent men in industrial field. The topics included are storeroom and tool room operation, factory buildings, costs, planning and routing. Field trips give opportunity of observing how these various ideas are worked out in the factory. Lectures, problems, field trips. *Prerequisite:* M.E. 35. Two hours credit. First semester.

41. **Automobile Engineering Seminar.** Student prepares a paper on current topics of the automobile industry and one covering an investigation of some special subject; class discussion of papers. Reading, preparation of papers. One hour credit. Each semester.

42. **Factory Management—Advanced.** Special problems for study and investigation. Problems, reports. *Prerequisite:* M.E. 35. Two or three hours credit. Second semester.

44. **Automotive Electrical Equipment.** A study of storage batteries, ignition, starting and lighting equipment for gasoline automobiles; storage battery equipment, charging apparatus, motors and control equipment for electrically propelled vehicles. Lectures, recitations, laboratory. *Prerequisites:* Physics 46 and M.E. 29. Three hours credit. Each semester.

50. **Gyroscopic Action and Critical Speeds.** Fundamental principles and applications of gyroscopic action; synchronous action in general; mathematical study of critical speeds; empirical treatment of complex cases. Lectures, recitations. *Prerequisite:* E.M. 3. Two hours credit. Each semester.

52. **Accident Prevention and Safety Engineering.** This course is designed to give the student an appreciation of the technical elements and human factors involved in accident prevention. Accident and fire prevention methods and devices are considered.
Lectures, recitations, and reports. *Not open to freshmen.* Two hours credit. Each semester.

53. Personnel Problems in Engineering. This course is designed to give the student an appreciation of the personnel or human problems in engineering. Typical problems and situations are featured. Lectures, demonstrations, discussions, and recitations. *Not open to freshmen.* Three hours credit. Each semester.

55. Advanced Thermodynamics. A continuation of Course 5 consisting of the application of principles to advanced problems in heat engines, air compressors, and refrigerating machines, together with lectures dealing both with engineering phases and the relation of the laws of thermodynamics to modern physical concepts of matter and energy. *Prerequisites:* M.E. 5 and 8. Three hours credit. Second semester.

Summer Session

Courses 2, 3, 4, 6, 7, 8, and 17s, or similar courses, will be given during the Summer Session of 1930.

81. NAVAL ARCHITECTURE AND MARINE ENGINEERING

Professors Sadler and Bragg; Associate Professor Lindblad; Assistant Professor Adams.

The work in this Department has for its object the training of men in connection with the design and construction of ships and their machinery, and also of those who may wish to enter the field of water transportation. The three main divisions are as follows:

**Naval Architecture**, which embraces all questions relating to the design and construction of ships, and includes such topics as the displacement and buoyancy, strength, resistance, propulsion, and stability; and methods of solving the general problem of ship design.

**Marine Engineering**, which includes those subjects which deal more particularly with the design and construction of the various types of machinery, such as steam reciprocating, turbine and oil engines, boilers of different types, and auxiliaries.

**Water Transportation**, which deals more specifically with those problems which enter into the selection of types of vessels suitable for various trades and conditions of operation, and which in addition to a general knowledge of the design and construction of vessels, also includes certain studies in economics, finance, and trade.
The Courses offered in the Department are therefore designed to give a student a thorough training in the fundamental problems relating to the marine field, with certain of them open to elective work which may give him a more specific training in the particular line of work which he may wish to follow, in any group.

The Department of Marine Engineering in planning out its course of study has had in mind the fact that the basic work is similar to that in Mechanical Engineering, with the slight differentiation largely in the fourth year. As a ship represents a floating power plant, fundamental courses in Civil, Electrical and Chemical Engineering are also included. While recognizing the fact that, in the shipbuilding and shipping industry, men are eventually segregated into the above groups, it has been thought advisable to devote more time to the essentials of the subject, rather than to undue specialization in any one, and to give the student as broad a background as possible. If, however, further specialization is desired, it is recommended that the student return for a fifth year and enter the Graduate School. Facilities for research work are provided in the Naval Tank, or Marine Laboratory, which is unique in this institution.

The Department is in constant touch with all the shipbuilding and shipping establishments, not only in this district, but throughout the country, so as to enable its graduates to obtain positions in the various lines mentioned above.

Marine Engineering Laboratory.—On the first floor of the West Engineering Building the east wing contains the experimental tank. This tank is 300 feet long, 22 feet wide, with a depth of water of 10 feet. At the south end is a model room and work shop for the purpose of making models of vessels.

The models used in the tank for testing purposes are from 10 to 12 feet, and are made of paraffin wax. A clay mould is first made approximately to the shape desired, and a core inserted. The paraffin is then poured into the mould, and, after cooling, the rough model is taken to the model cutting machine. This machine consists essentially of two moving tables or platforms, upon one of which is placed the model and upon the other the drawing which it is desired to reproduce. The model moves under a pair of rotating cutters, which are made to follow the lines of the drawing. After cutting, it is brought to its final shape by hand, then carefully weighed, and sufficient ballast added to bring it to any desired draft and displacement.

The tank is spanned by a traveling truck which is driven by a motor and can be run at any desired speed. Upon this truck are mounted the dynamometers for measuring the resistance of the models of various forms at different speeds.
Combined Courses have been arranged with Albion, Battle Creek, and Olivet Colleges and the College of the City of Detroit. For detailed information see section 15.

Advice to Students of other colleges and universities with regard to planning their courses before coming to the University, is to be found in section 14.

Military Science.—The attention of prospective students in Naval Architecture and Marine Engineering is called to the Reserve Officers Training Corps. Those who consider taking Military Science are urged to enroll at the beginning of their course. For further details see section 64.

CURRICULUM IN NAVAL ARCHITECTURE AND MARINE ENGINEERING AND REQUIREMENTS FOR GRADUATION

Candidates for the degree of Bachelor of Science in Engineering, Naval Architecture and Marine Engineering, are required to complete the curriculum detailed below. For the definition of an hour of credit see section 50.

a) Outline of Required Courses

(1) Preparatory Courses:
- English 1 and 2, and a course from Group 3... 6 hours
- Modern Language and Cultural Electives... 16 hours
- Mathematics 3, 4, 33, 34.................. 18 hours
- Physics 45, 46............................... 10 hours
- Chemistry 5................................. 5 hours
- Drawing 1, 2, 3............................... 8 hours
- Shop 2, Metal Working and Treating........ 2 hours

Total ........................................ 65 hours

(2) Secondary and Technical Courses:
- Surveying 4, Use of Instruments.............. 2 hours
- E. M. 1, Statics.............................. 4 hours
- E. M. 2, Strength and Elasticity............... 3 hours
- E. M. 3, Dynamics............................ 2 hours
- E. M. 4, Hydromechanics...................... 3 hours
- M. E. 2, Elements of Machine Design.......... 3 hours
- M. E. 3, Heat Engines......................... 4 hours
- M. E. 4, Hydraulic Machinery.................. 3 hours
- M. E. 6, Machine Design...................... 4 hours
- M. E. 7, Mechanical Laboratory................ 2 hours
- M. E. 8, Mechanical Laboratory............... 3 hours
- Elec. Eng. 2a, Elec. App. and Circ.......... 4 hours
- Chem. Eng. 1, Engineering Materials......... 3 hours
- N. A. 1, Structural Design.................... 1 hour
N. A. 2, Ship Calculations ..................... 3 hours  
N. A. 4, Resistance and Propulsion of Ships .... 3 hours  
N. A. 5, Structural Drawing ..................... 2 hours  
Mar. Eng. 9, Marine Machinery ................ 3 hours  
*Mar. Eng. 10, Marine Boiler Design .......... 3 hours  
*C. E. 2, Theory of Structures ................ 3 hours  

Total .............................................. 58 hours  

Summary:  
Preparatory Courses ......................... 65 hours  
Secondary and Technical Courses .............. 58 hours  
Group Options .................................. 17 hours  

Total .............................................. 140 hours  

*Group Options.—Three groups of studies may be followed in this department, viz.:  

Group A, which is arranged for those who wish to devote the principal part of their studies to the design and construction of ships; and,  

Group B, for those who wish to specialize more in the design of propelling machinery and other machinery connected with ships.  

Group C, for those who wish to fit themselves for water transportation work.  

A. NAVAL ARCHITECTURE  
N. A. 3, Stability, etc. ......................... 3 hours  
N. A. 6, Ship Drawing and Design ............. 3 hours  
N. A. 7, Ship Drawing and Design ............. 3 hours  
N. A. 12, Experimental Tank Work .......... 2 hours  
N. A. 13, Ship and Engine Specifications .... 1 hour  
Electives ........................................ 5 hours  

Total .............................................. 17 hours  

B. MARINE ENGINEERING  
M. E. 5, Thermodynamics ....................... 3 hours  
M. E. 13, Steam Turbines ....................... 3 hours  
M. E. 15, Gas Engines ........................... 3 hours  
Mar. Eng. 11, Marine Engine Design .......... 3 hours  
Electives ........................................ 5 hours  

Total .............................................. 17 hours  

*Students electing Group C, Water Transportation, for their group options, will substitute Economics 51 and 52 in place of Mar. Eng. 10 and C.E. 2.
C. Water Transportation

THIRD YEAR

COURSES IN NAVAL ARCHITECTURE AND MARINE ENGINEERING

1. **Structural Design.** This course comprises a discussion of the principal features of construction of all types of ships; classification societies' rules; preparation of working plans. Lectures and recitations. One hour credit. First semester.

2. **Ship Calculations.** The following are the topics discussed: methods of determining areas, volumes, centers of gravity of ship-shaped bodies, displacement, centers of buoyancy, metacenters, and trim; free board and tonnage; launching; calculation of bending moments and stresses in vessels under various conditions. Lectures and recitations. Three hours credit. Second semester.

3. **Stability of Ships and Preliminary Design.** This course includes investigations of the stability of vessels and means of determining the same; discussion upon the rolling and seagoing qualities of ships; and methods of reducing rolling. The latter part of the course is devoted to estimates and calculations involved in the design of ships. Prerequisite: Course 2. Three hours credit. First semester.

Total Hours: 12
4. **Resistance and Propulsion.** In this course all items affecting the resistance and propulsion of various ships' forms; investigation of the theory and practice involved in the design of propellers; methods of conducting trial trips, etc., are discussed. *Prerequisite: Course 2.* Three hours credit. Second semester.

5. **Structural Drawing.** This course includes the laying out of a vessel and the preparation of the principal working structural plans, such as midship section, deck plating, bulkheads, and stern frame. Two hours credit. Each semester.

6. **Ship Drawing and Design. I.** The lines of a vessel of an average type are drawn and all the calculations are made which are necessary for plotting curves of form, launching curves, and strength curves. Three hours credit. Each semester.

7. **Ship Drawing and Design. II.** In this course the student is given the general features of a vessel and prepares a complete design of the same, including all the general plans and calculations. Three hours credit. Each semester.

9. **Marine Machinery.** It is the purpose of this course to familiarize the student with the different types of machinery used for propelling vessels. A study is made of the steam consumption of reciprocating engines and turbines, and of the capacity of different types of boilers to supply steam for their needs. The use of coal, pulverized coal, and fuel oil in connection with boilers is studied, and also the use of oil in internal combustion engines. The preliminary calculations are made for a triple expansion reciprocating engine and the sizes of the main parts are worked out. A brief study is made also of condensers and air pumps. Lectures, recitations. *Prerequisites: M.E. 3 and E.M. 1.* Three hours credit. First semester.

10. **Marine Boiler Drawing and Design.** In this course a Scotch marine boiler of general type is designed. Three hours credit. Each semester.

11. **Marine Engine Drawing and Design.** The complete general plans of a triple or quadruple expansion engine are prepared, together with all calculations for the same. Three hours credit. Each semester.

12. **Naval Architecture.** Laboratory Work in Experimental Tank. Two three-hour laboratory periods. Two hours credit. Each semester.

14. **Naval Architecture.** Shipyard Plants. Credit to be arranged.

15. **Naval Architecture.** Advanced Reading and Seminary. Credit to be arranged.

16. **Naval Architecture.** Advanced Drawing and Design. Credit to be arranged.

17. **Marine Engineering.** Advanced Reading and Seminary. Credit to be arranged.

18. **Marine Engineering.** Advanced Drawing and Design. Credit to be arranged.

---

**PHYSICS**

Professors Randall, Williams, Colby, and Smith; Associate Professors Rich, Barker, Lindsay, Sawyer, Goudsmit, and Uhlenbeck; Assistant Professors Sleator, Meyer, Cork, Duffendack, Firestone, and Dennison; Mr. Donal, Mr. Kievit, Mr. Young, and Mr. Fisher.

The instruction in general physics covers a thorough course with the use of trigonometry and extends throughout an entire year. The first semester is devoted to mechanics, sound, and heat; the second to electricity and light. The subjects are amply illustrated with appropriate experiments accompanying the lectures. One period a week is devoted to laboratory work. The numerous courses, both experimental and theoretical, which the Department offers, are open to students wishing additional work in physics.

**West Physics Building.**—The elementary work in general physics is carried on in the West Physics Building. The first floor contains the laboratories for electricity and light, a recitation room, the storage battery room, and the instrument shop. On the second floor are the large lecture room for demonstrations in general physics, a smaller lecture room, one laboratory for mechanics, consultation rooms, and apparatus rooms. The third floor contains two general laboratories and four recitation rooms.

**East Physics Building.**—Advanced work and research in physics have been removed to the first unit of the East Physics Building, the second unit of which, when built, will contain the large lecture rooms, laboratories, class, and consultation rooms for the elementary courses. The new laboratory has two wings 144 feet and 132 feet in length and each 60 feet wide. It is of reinforced concrete construction with specially deadened floors.
There are 4 stories, a basement, and a first and second sub-basement, all 7 floors connected by an elevator.

Laboratories are provided for heat and high temperature measurements, sound, light and applied optics, radioactivity, electrical measurements, and vacuum tubes, all supplied with adjacent apparatus, research, and consultation rooms. Sound has a two-story structure extending through the first and second basements entirely disconnected from the walls of the surrounding building. X-ray research has ample quarters in the first and second basements. The high potential generators are housed in a two-story room which permits ready distribution of power to a number of adjacent research rooms. Spectroscopy both in the photographic and infra-red regions has a series of laboratories. In addition, there are single and multiple unit research rooms available for any purpose. All rooms are provided with numerous storage battery connections and both the 110 v. A.C. and 220 v. D.C., as well as water, gas and compressed air. Three storage batteries contain altogether 640 cells, and switchboards make possible a universal distribution of power. In addition, there are 2 instrument shops, a wood shop, a glass blowing room, and general apparatus rooms. The building also contains necessary offices, four rooms for lectures and classes in advanced courses, a library, and a faculty room.

The inclusion of a degree in physics among other degrees offered by this College, has its justification in the rapid introduction of the findings of physics and the methods of physical research into industry. The demand for physicists far exceeds the supply, and is continually increasing. Anyone finding the subject attractive may become an industrial physicist, confident that his profession is one of great usefulness and ever expanding possibilities.

The schedule of courses leading to the degree of Bachelor of Science in Engineering, Physics, is to be considered as illustrative rather than as fixed. The Department will be glad to consult with all students interested, both as to the possibilities of the new profession and the particular work best suited to each individual.
CANDIDATES FOR THE DEGREE OF BACHELOR OF SCIENCE IN ENGINEERING, PHYSICS, ARE REQUIRED TO COMPLETE THE FOLLOWING PROGRAM OF STUDIES:

A) PREPARATORY COURSES:

English 1 and 2, and a course from Group 3........6 hours
*Modern Language and Cultural Electives........16 hours
Mathematics 3, 4, 33, 34.........................18 hours
Physics 45, 46.................................10 hours
Chemistry 5 and 17.............................10 hours
Drawing 1, 2, 3............................... 8 hours
Shop 2....................................... 2 hours

70 hours

B) SECONDARY AND TECHNICAL COURSES:

Eng. Mech. 1, Statics............................ 4 hours
Eng. Mech. 2, Strength and Elasticity........... 3 hours
Eng. Mech. 3, Dynamics........................ 2 hours
Eng. Mech. 4, Hydromechanics..................... 3 hours
Mech. Eng. 3, Heat Engines....................... 4 hours
Chem. Eng. 1, Engineering Materials............... 3 hours
Elec. Eng. 1, Principles of Electricity and Magnetism........................................ 4 hours
Elec. Eng. 2, Direct Current Apparatus and Circuits 4 hours
Elec. Eng. 3, Alternating Current Circuits........ 4 hours
Physics 105, Modern Physics...................... 2 hours
Physics 147, Electrical Measurements............... 4 hours
Physics 165, Vacuum Tubes....................... 2 hours
Physics 186, Light................................ 4 hours

43 hours

C) GROUP OPTIONS AND ELECTIVES:

Group Options in Physics and Mathematics to meet the particular needs of the individual student ............................................. 12 hours
General Electives ........................................ 15 hours

27 hours

SUMMARY:

Preparatory Courses ..................................70 hours
Secondary and Technical Courses....................43 hours
Group Options and Electives........................27 hours

140 hours

*Students in this curriculum may satisfy the modern language and cultural requirement in the College of Engineering in the usual way, or they may elect twelve hours each of French and German.
COURSES IN PHYSICS

Description of Courses.—For all courses beyond 100, except Course 130 which requires 45 only, Physics 45 and 46 are prerequisites. The individual courses may have particular prerequisites besides. Courses 45 and 46 (formerly 1E and 2E) are required of all engineering students. Calculus is a prerequisite for courses numbered above 130.

5. Physics for Admission. This course is intended for students who have not presented the required unit of entrance physics. This course or its equivalent is required for admission to Course 45. M, W, Th, and F, at 5. No credit will be allowed for this course. First semester.

41. General Physics—Mechanics, Sound, and Heat. This course is the regular one for students in Architecture 1 and 2. At least half the semester is devoted to elementary mechanics, the remainder to sound and heat, all with experimental illustrations in the lectures. Two lectures, and three recitations, of which one is for problems, a week. A knowledge of plane trigonometry is indispensable. No student is admitted to the class who has not had a preparatory course in physics. Four hours credit. Each semester.

45. Mechanics, Sound, and Heat. At least half the semester is devoted to elementary mechanics; the remainder of the time to sound and heat; all with experimental illustrations. Two lectures, three recitations, and one two-hour laboratory period a week. No student is admitted to the class who has not had a preparatory course in physics. A knowledge of plane trigonometry is indispensable. Five hours credit. Each semester.

46. Electricity and Light. A continuation of Course 45. It takes up the fundamental phenomena and laws of electricity and light with ample class illustrations. Courses 45 and 46 are required of all engineering students. Students transferring their credits from the College of Literature, Science, and the Arts will be required to offer Courses 35, 36, 37, and 38 as equivalents of Courses 45 and 46. Must be preceded by Course 45 and by Course 5E in chemistry, or an equivalent. Two lectures, three recitations, and one two-hour laboratory period a week. Five hours credit. Each semester.

105. Modern Physics. This course treats of radioactivity, X-rays, a vacuum tube, and other electron and allied phenomena which lead to the theory of matter. It undertakes to meet the needs of those students who desire accurate information about recent work for the purpose of general culture and of those
specializing in other sciences in which the newer physics has an increasing importance. Students specializing in physics will also find it suitable introduction to advanced courses. Two lectures a week, with discussions and demonstrations. The course will be non-mathematical, requiring as prerequisites Courses 35 and 36 or 45 and 46. Two hours credit. First semester.

121. X-ray Equipment and Apparatus. This course is intended primarily for students not specializing in physics. The work is partly experimental and will be conducted in the Department of Physics and in the Department of Roentgenology in the University Hospital. It will consist of the study of the underlying electrical principles and the electrical apparatus necessary; various types of tubes and their characteristics; the production and fundamental principles of X-rays, including demonstration of present-day measuring instruments, their use, and the practical dosage of X-rays in therapy. Prerequisite: Course 36 or Course 46. One lecture and one two-hour laboratory period a week. Two hours credit. First semester.

130. Architectural Acoustics. Lectures with illustrative problems on sound transmission, distribution, and absorption, and an experimental study of the acoustic properties of certain rooms. Prerequisite: Course 45 (or 41 or 35). Two hours credit. Second semester.

145. Electrical Measurements. This course is not intended for electrical engineers. In the class work the principles of electrical behavior are critically studied and discussed. The laboratory exercises are designed to illustrate and emphasize these principles, and to give the student some personal experience in the careful use of electrical measuring instruments. The course includes the modern methods of measuring current, resistance, electromotive force, and power, and the calibration of the instruments employed. Three lectures and one four-hour laboratory period a week. Four hours credit. First semester.

147. Electrical Measurements. The course includes the modern methods of measuring current, resistance, electromotive force, capacity, inductance, and hysteresis of iron, and the calibration of the instruments employed. This course (formerly 5E) is the regular one for electrical engineering students. Prerequisites: Course 46 and E.E. 3. Two lectures and one four-hour laboratory period a week. Four hours credit. Each semester.

154. Electrical Measurements. This is a continuation of Course 145 and includes measurements of capacitance, self and mutual inductance, and the fundamental measurements with alter-
nating currents. Especial attention is given to the theory of the magnetic circuit and the determination of the magnetization and hysteresis curves of iron and steel. Three lectures and one four-hour laboratory period a week. Four hours credit. Second semester.

156. **Electron Theory and Radioactivity.** Among the topics considered in this course are the radioactive disintegration of atoms, the nature and properties of alpha, beta, and gamma rays, the determination of the electronic charge, the arrangements of electrons and protons to form atoms, electrical mass, positive rays, isotopes, thermionic currents, and metallic conduction. Two hours credit. Second semester.

158. **Radioactivity.** The laboratory work is largely with radioactive substances. The distinguishing characteristics of alpha rays, beta rays, and gamma rays are studied, and the half life periods of several substances are determined by each student. One two-hour laboratory period a week. *Must be preceded or accompanied by Course 156.* One hour credit. Second semester.

165. **Vacuum Tubes in Radio Communication.** The theory of the transmission of electricity through gases and through vacua is treated in this course together with a study of the different types of tubes used in radio work. The experimental work deals with the characteristics of tubes, the different types of detector action, the determination of amplifying factors, and the operation of power tubes. Electrical circuits for the use of tubes in connection with high frequency phenomena are treated in detail. One lecture and one three-hour laboratory period a week. A knowledge of alternating currents is necessary. Two hours credit. First semester.

166. **High Frequency Electrical Measurements.** A laboratory course consisting of selected problems. Open to a limited number of students who have had adequate preparation. Two three-hour laboratory periods a week. *Prerequisite: Course 165.* Two hours credit. Second semester.

171. **Mechanics.** The mechanics of solids, liquids, and gases. The various types of motion, statics, dynamics, elasticity, friction, viscosity, capillarity, and an introduction to the mechanics of the atom. Elementary operations with vectors are employed in certain problems. Three hours credit. First semester.

174. **Sound.** Lectures and recitations covering the theory of vibrating systems; the production, propagation, and measurement of sound; and subjective sound phenomena. Text, Richardson, *Sound.* Students intending to take Course 165, Vacuum
Tubes, should do so before entering this course. Two hours credit. Second semester.

176. **Laboratory Work in Sound.** A course to accompany or follow Course 174. Four hours per week in the laboratory are devoted to experiments on vibrating systems, the condenser transmitter and thermophone for absolute intensity measurements, binaural localization, the absolute sensitivity of the ear, and other subjective phenomena. Since vacuum tube amplifiers and oscillators will be used, students intending to take Course 165, Vacuum Tubes, should do so before entering this course. Two hours credit. Second semester.

181. **Heat.** The work covers the fundamental principles of heat phenomena. Such subjects as temperature measurement, thermal expansion, heat transfer, specific heats, change of state, elementary kinetic theory, and thermodynamics are treated. Lectures and recitations. Two hours credit. First semester.

182. **Measurements of High Temperature.** A survey of the various types of furnaces now in use in the industries for the production of high temperatures is briefly made. Opportunity is given the student to work with laboratory models of such various types as the gas combustion furnace, electric arc, electric conduction and electric induction furnaces. In the measurement of high temperatures, practice is given in the calibration and use of resistance thermometers, thermo-electric devices, total radiation and optical pyrometers, as well as temperature recording and controlling devices and transition point apparatus. The subject matter is taken up from both practical and theoretical standpoints. Opportunity for work on special problems might be given to students qualified. Two hours credit. Second semester.

183. **Laboratory Work in Heat.** A course to accompany or follow Course 181. Four hours per week in the laboratory are given to a study of modern accurate methods of measuring various thermal quantities, the need of the determination of which often arises in the course of scientific research. The student is given opportunity to become familiar with any of the modern temperature measuring devices, the determination of thermal expansion by several methods, including the interferometer and X-rays, measurement of specific heats, ratio of specific heats, thermal conductivities, etc. Two hours credit. First semester.

186. **Light.** An intermediate theoretical course treating the subjects of interference, diffraction, law of extreme path and aplanatic surfaces, polarization and double refraction, the nature of white light, and experiments on ether drift. Two hours credit. Second semester.
187. Geometrical Optics. A course in the fundamental methods and principles of geometrical optics and the design of optical instruments. Thick lens optics, the ideal optical instrument, the aberration theory of Abbé, a study of the characteristics of optical instruments and exercises in the design of simple instruments, and discussions of the various types of optical glass. Three lectures or recitations a week and occasional laboratory exercises. Three hours credit. First semester.

188. Laboratory Work in Light. A course to accompany or follow Course 186. Four hours per week in the laboratory are used in the study of refraction, interference, diffraction, the examination of spectra and practice in the use of optical instruments. Four hours per week to be arranged. Two hours credit. Second semester.

196. Atomic and Molecular Structure. A review of recent developments in the theory of atomic and molecular structure and the solid state, with numerous references to current literature. Three hours credit. Second semester.

201, 202. Physics Pro-Seminar. Discussion groups for the study of the current literature of physics. Recommended for all graduate students in their first year of residence. Required of all candidates for the master's degree. Hours to be arranged. One hour credit each. Throughout the year.

204. Molecular Physics. A continuation of Course 203 introducing (1) the quantum hypothesis, with a discussion of the modifications which it requires in the treatment of several of the problems previously presented; (2) spectroscopy considered as a tool for the study of the structure and properties of matter. Three hours credit. Second semester.

206. Electricity and Magnetism. This course is a continuation of Course 205, developing the theory of electromagnetic waves and radiation from the Hertzian oscillator. Three hours credit. Second semester.
207. **Theoretical Mechanics.** Statics and the dynamics of a particle and of a rigid body. The general minimum principles. *Prerequisite: an adequate course in ordinary differential equations.* Three hours credit. First semester.

208. **Theoretical Mechanics.** The equation of Lagrange and Hamilton with applications. The equation of Hamilton-Jacobi. The general transformation theory. Three hours credit. Second semester.

211. **Quantum Theory and Atomic Structure.** The fundamental postulates of Bohr and his formulation of the quantization rules for multiple periodic systems. The correspondence principle. Perturbation theory. Applications to atomic spectra (optical and X-ray) and band spectra. Bohr's theory of the periodic system of the elements. Pauli's exclusion principle. The spinning electron and the vector model. *Prerequisite: Course 196.* Three hours credit. First semester.

214. **Introduction to Theoretical Physics.** Continuation of Course 213. Distinction between elliptic, parabolic, and hyper-

250. X-rays. The fundamental facts and theories connected with the production and properties of X-rays, together with a study of the development of the subject and its bearing on modern ideas of the structure of matter. Considerable emphasis is placed on spectroscopy, and opportunity is afforded to do some experimental work. Three hours credit. Second semester.

285. German Reading. In this course the subject of physics is studied in German to acquaint the student with the technical terms used in modern German physics. This course may be taken only by such students as convince the instructor of their satisfactory preparation. One hour credit. First semester.

Summer Session

Course 5, intended for students preparing for entrance to the College of Engineering, and Courses 35, 36, 37, 38, 39, 40, 45, 46, 105, 130, 145, 154, 156, 158, 160, 165, 171, 186, 205s, 210s, 215s, 220s, 231, 250s, 262, 265s, 280, and 281, or similar courses, will be offered in the Summer Session of 1930.

83. ENGINEERING-LAW COMBINED CURRICULUM

The College of Engineering and the Law School of the University offer a six-year combined course to meet the needs of those members of the bar whose practice is in fields for which an engineering foundation is desirable.

Such fields include patent-law, for which a knowledge of mechanical and electrical devices and of processes is important, and law as affecting the operation and the business of public-service, manufacturing, and other corporations.

There is moreover an increasing tendency for graduates in law to engage in the management of corporations. The combined course should therefore be of value to many also who are not actively engaged in the practice of law.

It is believed that many of the studies in an engineering curriculum, such as mathematics, physics, and engineering mechanics
The student in the combined course is registered in the College of Engineering for three years and then in the Law School for a like period. On the completion of the three-year curriculum in the College of Engineering with a minimum average grade* of 2.5, the student is recommended for transfer to the Law School. On the satisfactory completion of the first year of the law curriculum, the student will be recommended for the degree of Bachelor of Science in Engineering. The diploma given will bear the legend Law.

Students of the College of Engineering transferring to the Law School without having completed the first three years of the combined course with the required grade will not be recommended by the College of Engineering for its degree.

The following schedule for the first three years has been approved by the two faculties as the general requirement for the Engineering-Law Combined Course. Minor modifications or substitutions in the purely engineering courses may be made, subject to the permission of the committee in charge. Students should note that application for admission to the Law School must be made before April 20, and that the College of Engineering requires a higher average grade for its recommendation for transfer to the Law School on the combined course than it requires for graduation in the four-year curricula.

a) Preparatory Courses.
   English 1 and 2, and choice of Group 3 ............ 6 hours
   Modern Language .................................. 8 hours
   Mathematics 3, 4, 33, 38 ........................ 16 hours
   Physics 45, 49 ................................... 10 hours
   Chemistry 5E ...................................... 5 hours
   Drawing 1, 2, 3 .................................. 8 hours
   Shop 2 ........................................... 2 hours

       Total ........................................... 55 hours

b) Secondary and Technical Courses.
   Surveying 4 ...................................... 2 hours
   Eng. Mech. 1, Statics ............................ 4 hours
   Eng. Mech. 2, Strength and Elasticity ............ 3 hours
   Eng. Mech. 3, Dynamics ........................... 2 hours
   Eng. Mech. 4, Hydromechanics ....................... 3 hours
   Civil Eng. 2, Theory of Structures ............... 3 hours
   Chem. Eng. 1, Engineering Materials ............... 3 hours
   Elec. Eng. 2a, D. C. Apparatus and Circuits ....... 4 hours

*See section 35 for the grading system.
Mech. Eng. 2a, Elements of Machine Design ...... 3 hours
Mech. Eng. 3, Heat Engines .................... 4 hours
Mech. Eng. 5, Thermodynamics ................ 3 hours
Economics 53, 54, General Economics ........... 6 hours
Political Science 31, 32, American Govt. ...... 6 hours

Total ........................................ 46 hours
c) Electives to be selected from the following group:
   Engineering, Mathematics, Physics, Chemistry, Astronomy, Geology, Economics, Political Science, History, Psychology, English, Modern Language, Accounting ........................................ 10 hours

Summary:
   Preparatory Courses .......................... 55 hours
   Secondary and Technical Courses ............. 46 hours
   Electives ................................... 10 hours

Total for three years in Engineering ........... 111 hours

PART VI

COLLEGE OF ARCHITECTURE*

GENERAL STATEMENT

84. The College of Architecture aims to give the student a thorough training in the fundamentals of modern architectural practice.

The following is an effort to reply in a general way to the questions which prospective students and their parents ask regarding the profession of architecture and the courses in architecture. Once the services rendered by the architect are understood, there is a ready appreciation of the significance and value of the courses and subjects which make up the programs of study.

THE NATURE OF ARCHITECTURE

85. Architecture, the oldest of the constructive sciences, and since ancient times also ranked as a fine art, deals principally with the design of buildings, their accessories and surroundings, their construction, decoration, and equipment.

Architecture is born of the necessity for buildings and the desire to have them appropriate and pleasing in plan and design, as well as sound in construction. By its very nature, therefore, architecture is much more circumscribed as a medium of expression by utilitarian and technical conditions than is any other of the fine arts; unlike its sister arts of painting and sculpture, it must function at once practically and artistically, and misses its aim in failing in either.

SERVICES RENDERED BY THE ARCHITECT

86. The duties of the architect consist for the most part in conferences with clients and builders, in the preparation of drawings and documents required for the erection of buildings, and in the supervision of building operations. The drawings consist of

*For admission requirements, etc., see section 10. For courses other than those in Architecture, see Parts IV and V.
several kinds: "Preliminary studies," in which the general arrange ment and design of the building are fixed upon, many schemes often being made in order to reach the one most advantageous in point of arrangement, appearance, and economy.

"Working or scale drawings" are prepared after a scheme has been approved by the owner. These are larger drawings which accurately define the proportions of the design, the disposition and dimensions of all the parts, such as the walls, openings, and heights of stories, and show the distribution of the structural, enclosing, and decorative materials. In connection with these drawings all calculations are made to determine the required strength of constructive parts, such as the foundation, columns, beams, and trusses, the capacity and character of the equipment for heating, ventilation, sanitation, and illumination. The working drawings are accompanied by "specifications," which define the kind and quality of materials to be used throughout the fabric; they describe the apparatus and fixtures to be installed, the grade of workmanship that is expected, and define just what is expected of all parties concerned.

After bids have been received and the builders selected, contracts are drawn by the architect which define the obligations of the builders and owner. The larger "detail drawings" are then made for structural and decorative features, while the architect supervises the progress of the actual building operations to see that the terms of the contract are fairly carried out by the builder, his agents, and the owner.

OTHER ACTIVITIES OF ARCHITECTS

87. Architects also occasionally take part in competitions for which, if properly conducted, a carefully prepared program is given all competitors and an expert jury is retained to select the best solution presented. In such competitions the drawings are confined to the preliminary study stage. Owing to the delay, expense, and uncertainties of this method of selecting an architect, it is employed for but a small proportion of the building undertakings of this country, and then primarily for important public projects. Most architects gain their opportunities through demonstrated fitness and integrity. Architects also help determine and
often design the decorative features of interiors, for larger work co-operating with decorators, painters, and sculptors; they often design the grounds and approaches of buildings, and have taken an active part in the planning of cities, independently and in association with landscape designers and engineers, for, after all, buildings must form the most permanent and salient decorative features of the city.

The architect, then, is expected to meet alone or with the aid of his assistants and experts the varied artistic and practical problems related to all classes of buildings. In doing the above he must deal with public and private interests, with the products of numberless industries, and with an exceptionally wide range of activities and human endeavor, extending from those of laborers and artisans to those of artists and technical specialists.

TRAINING OF THE ARCHITECT

88. Those who are to exercise in so nearly equal degree the functions of an executive, an artist, and a constructor must needs receive a comprehensive training, one which will develop the kind of mental and moral fibre required for doing effective artistic and technical work and for meeting and dealing with men and affairs.

The old apprenticeship system which preceded the organization of architectural schools is rapidly disappearing, and is being replaced by the modern apprenticeship, which consists in working in an architect's office during vacations and after graduation from college, since progress is thus far more rapid, sure, and remunerative. The technically trained architect having "made good," it is now expected, most fortunately, that in addition to professional training he, like other educated men, have an insight into the larger questions underlying the affairs of the world.

Success in the architectural field depends largely on the same general conditions and personal qualities as are demanded in other professions. Those who expect to follow architecture as a profession should be imbued with an interest in building, in beautiful things, and in drawing. To a certain extent skill in design, construction, and drawing may be attained by all those who persist and have a real interest in the work. Artistic and constructive
talent is valuable only if developed by serious work and supported by knowledge, while the mere assimilation of knowledge and acquirement of skilled draftsmanship are insufficient. Unremitting self-discipline and enthusiastic effort are required to attain the creative power and the ability to use knowledge effectively which mark the productive worker.

Until recently it was considered that graduation from a good high school, followed by four years in an architectural school and several years' experience in architects' offices should be the minimum preparation for independent practice, while a longer period of collegiate training, along with travel in this country and study and travel abroad, now actually forms the more extended preparation of many.

The American Institute of Architects and the Association of Collegiate Schools of Architecture now recommend that students devote at least five years to collegiate study as preparation for the baccalaureate degree in Architecture, dividing the additional year between technical and non-technical subjects with a view to attaining greater breadth and thoroughness.

In the three four-year programs in Architecture now offered at this University fully one-third of the time, approximately three semesters, is given to non-technical subjects, such as English, foreign language, economics, physics, mathematics, geology or mineralogy, fine arts and electives. By apportioning a fifth year between cultural and technical courses the student will spend approximately two full years on fundamental and general subjects and three full years on semi-professional and professional subjects. Since it is desirable to begin drawing and creative work immediately upon entering the Architectural School, the general and cultural courses should be distributed over the entire time the student is in residence rather than completed before the technical subjects.

The training requisite for the architect may be stated under three principal heads:

a. General education

b. Technical or professional education

c. Experience in actual architectural work and business affairs
a. GENERAL EDUCATION

The purpose of the first of these is to provide the essentials of a liberal education, that which tends to make the educated man and citizen, and helps give an understanding of the larger questions of life and thought and of the interests of others. Undoubtedly university life and associations stimulate interest in the above. The student should therefore while in the University receive those fundamentals of a general education which cannot be studied systematically later when he is absorbed in the exacting routine of the practical field. These studies will keep him from becoming merely a narrowly specialized tool to be used by men of broader caliber. Moreover, the economic and social forces which shape his very opportunities must be understood if he is to interpret them with sympathy, intelligence, and artistic judgment. To this end, literature, science, business administration, economics, philosophy, and kindred subjects are invaluable and should receive attention throughout the collegiate period, since they require as great thoroughness of preparation and maturity of mind as the most advanced technical subjects.

b. PROFESSIONAL OR TECHNICAL EDUCATION

Technical education, the second division, provides the special knowledge expected of the architect, trains him in fundamental principles, and develops his taste and skill in solving the problems peculiar to the architectural field. A full statement regarding technical courses will be found under the "Work of the College" in this announcement.

c. EXPERIENCE

General and technical education prepare for the third division, in which the graduate, preliminary to independent practice, gains experience in an architect's office in the application of technical knowledge and in the conduct of an office and actual building operations. This period brings home a fuller realization of the need of thorough training and of personal force to carry to completion building projects, and to cope with all the attendant conditions. The time required for this practical experience will vary according to the ability and opportunity of the individual.
HIGHER DEMANDS ON PROFESSIONAL MEN

89. Higher demands than ever before are being made today upon professional men. Hence, professional education is characterized by demand for at once higher specific training and additional general education. This is shown by the tendency to require more or less collegiate cultural preparation—indeed, in some cases the bachelor's degree—for admission to schools of medicine and law.

In some professional fields, specialization may or should come on the basis of a groundwork of general collegiate training alone; but in architecture training in drawing and design should begin with the first year of college, since development of the power of expression and creative design is facilitated by being continued over a long period rather than concentrated in a short one. This is particularly true in a country where the lack of artistic environment and of adequate preliminary training in drawing seriously handicaps architectural education, making it necessary to give, for the majority of students, all or most of the preliminary and subsequent technical training, as well as the elements of a general education, in four years.

SPECIALIZATION IN ARCHITECTURE

90. While ideally desirable that the architect be expert in all allied fields, it is manifest that such omniscience is denied to men at the end of a four-year course or an infinitely longer one. Indeed, the impossibility today of mastery in all fields of architecture by even the most accomplished practitioner has led to specialization within the architectural field. There are now, as a result, many architects who specialize in the design and construction of single classes of buildings, such as hospitals, theaters, schools, churches, office buildings, residences, or city planning, and who in doing this work employ a corps of trained assistants.

Parallel with the increased demands made on the profession, education in architecture has developed to such an extent that four or more years may be devoted solely to technical subjects. If, however, students were permitted to pursue such an over-professionalized course without preliminary or parallel cultural training
they would find, when too late, that they had lost one of the primary opportunities of their college course.

If specialization is desired within the field of architectural education it must be either in the direction of architectural design or construction. Hence, at the University of Michigan there exist three four-year programs in architecture the first of which is a general professional course, while the second and third emphasize, respectively, design and construction, in all of them a fair allowance being made for cultural studies. There is, in addition, a four-year program in decorative design.

Those who desire more advanced training are urged to plan their work in such a manner that it will include not less than five years, spreading the technical and cultural requirements over the entire period.

**OUTLOOK FOR THE ARCHITECT**

91. At no time in the history of the United States has there been so much interest in good architecture. Never before has there been so excellent an outlook for the trained architect. Classes of buildings which formerly were hardly considered from an artistic point of view, such as factories, warehouses, and the like, are now designed by architects. Our great corporations have come to a realization of the value of buildings which are at once adequate, attractive, and interesting. Cities, everywhere, by means of general improvement plans, are recognizing the need of good design in everything, and in this city planning development the architect is playing a most important part; even in primarily utilitarian projects our municipalities will no longer permit the erection of structures which are merely adequate, but are employing architects to assure the creation of something that will be permanently pleasing as well as useful.

The art development, of which architecture forms but a part, has barely begun in this country. So long as this country continues its marvelous growth highly trained men will be needed to give form to building projects of the most varied character. The prospect is therefore full of promise for the architect and for the architectural school.
FOUR-YEAR PROGRAMS OF STUDY

92. Four four-year programs are offered, Programs I and II in Architecture, Program III in Architectural Engineering, and the Program in Decorative Design, each requiring four years of study. These should be supplemented on the part of architectural students by work with an architect during the vacation periods. Students in decorative design should spend the same time in the employ of an interior decorator. In each architectural program provision is made for the study of theory, history, and practice of architecture, for training in language, mathematics, science, construction, design, building equipment, drawing, and electives.

The first year being practically identical in the three architectural programs, such students can, with faculty permission, at the end of that period change from one program to another without loss of credit. The courses in drawing, most of those in architectural design, practical building construction, and working drawings, sanitation and architectural history are common to the three architectural programs. General Physics is required in Programs I and II; Engineering Physics in Program III.

Programs I and II aim to prepare the student for general architectural practice. They differ only in that solid analytic geometry and a course in calculus is required in Program I, in place of which six hours of design and a course in landscape design are required in Program II. The advanced construction is taught on the basis of two special courses in mechanics given by the College of Architecture.

Program III, Architectural Engineering, or Construction, meets the needs of those who in association with architects or others will specialize in building construction and equipment. Hence, in addition to architectural design and practical building construction, which together prepare for intelligent and sympathetic collaboration with architects and builders, these students pursue engineering courses in structural design, heating and ventilation, heat engines and some work in testing materials, surveying, and the chemistry of engineering materials. In this program the architectural studies may be completed in two and one-half years. Hence, students who have completed the first year of an engineer-
ing course and wish to take up architectural engineering may yet graduate at the end of four years.

During the senior year architectural design forms the chief study in Programs I and II, while in Program III framed structures, structural design, and other engineering subjects take up most of the year.

The above programs may be completed in four years by well prepared and conscientious students; those who have difficulty with a subject can either extend their period of study or make up deficiencies in the Summer Session.

A four-year program is provided for students in decorative design. For the present the emphasis is placed on interior decoration, but all of the fundamental courses are offered for those expecting later to specialize in the art associated with advertising, commonly designated “commercial art.” Interior decoration requires a considerable knowledge of the surface qualities of architecture rather than the organic view of the architect in which plan, construction, and artistic form must all be considered. The architect designs and builds the building; the decorator may take a portion of the interior and give it added emphasis or interest through surface treatment and furnishing. He collaborates with the architect in carrying out the spirit of the building as a whole; he must have a good general knowledge of design, be resourceful in the use of color and pattern and in the production and use of textiles, furniture and fixtures, and he must also be well versed in the materials of which decorative equipment is made.

The training of the decorative design student comprises considerable freehand drawing and modeling, some mechanical drawing, perspective, the elementary courses in architectural design, those in architectural history and fine arts, with a liberal provision for the history of art and non-technical courses. The major requirement is in decorative design leading from introductory courses in decorative composition and color finally to a working out of entire interiors of various types.
DEGREES CONFERRED IN THE COLLEGE OF ARCHITECTURE

93. The degree conferred in Programs I, II, and III of the College is Bachelor of Science in Architecture, the diploma specifying the program which the student has completed. The Program in Decorative Design leads to the degree of Bachelor of Science in Design.

GRADUATE STUDY AND DEGREE

94. Students who are able to attend an additional year for graduate work will find the time well spent. Graduate work may be done in design, construction, the history of architecture, and in general studies. Such work shall be of an advanced character, a thesis on the design and construction of a building being required in the second semester.

For graduate courses leading to the degree of Master of Science in Architecture, the student must register in the Graduate School, but will pursue his work under the supervision of the Faculty of the College of Architecture. For particulars, see the Announcement of the Graduate School.

OTHER CLASSES OF STUDENTS

95. Candidates for both the Bachelor of Arts and Bachelor of Architecture degrees, in order to graduate in Architecture in two years after obtaining the Arts degree, should complete at least the first two years in the architectural courses, while candidates for the first degree. Students wishing to carry on some general college work parallel with or before beginning the work in Architecture, should consult as soon as possible with the Professor of Architecture in order to plan their work in the most advantageous manner. In general, work in drawing and design should be begun early and extend over a long period rather than be concentrated into one or two years.

College graduates who hold the Bachelor of Arts degree are able to earn the professional degree in from two to three years.
according to the program pursued and the extent of their undergraduate preparation.

Those who expect to enter from other colleges or to transfer from other departments of this University should aim to bring as much credit as possible in freehand drawing, as well as credits in descriptive geometry (the equivalent of Architecture 2 and Architecture 3) and the mathematics and physics of the program they intend to follow.

Students registered in other colleges may elect the courses in history of architecture, elements of design, allied arts and decorative design, and other courses for which they are qualified.

TWO-YEAR PROGRAM FOR SPECIAL STUDENTS

96. A two-year program is provided for special students in Architecture upon the completion of which there is awarded a certificate of proficiency.

Owing to the difference in the preparation of such students but part of the work is prescribed, the remainder being elective, to be arranged in consultation with the head of the College.

Special students may specialize in either design or construction.

Design, history of architecture, and freehand drawing are studied throughout the two-year program; one year is devoted to construction, another year to building equipment.

In design such students are placed in the class indicated by their preparation. Very often the preparation of such students is sufficient to enable them to enter as regular students. It is then to their advantage to elect as much as possible of one of the four-year programs, returning later to complete the requirements of a regular program.

Special students who enter with enough preparation in mathematics can go on with Mathematics 1, then Architectural Mechanics 19 and 20, finally structural design, Architecture 22, 23, 26, and 27, thus completing part of the advanced building construction within two years of residence.
97. Design.—While design, owing to its comprehensive character, is of the greatest importance to the architect, it should be, and is, carried on parallel with the courses in construction, the history of architecture, science, and general studies which actually increase efficiency in design and make for breadth of view and greater ultimate success in the field of independent practice.

The aim throughout these courses is to develop the imagination, creative power, ability to work out the organism of a building, and skill in the clear and artistic presentation of the drawings.

The policy in teaching design, while insisting on fundamental principles, is to encourage freedom of expression, to make possible, where permitted by the character of the problem and the requirements of the program, a wide range of interpretation, thus to bring into relief the relative value of the various solutions of which each problem is capable. While the larger aspects of the composition are of chief importance, careful consideration is given to the character of the form as related to the constructive scheme and the material. Occasionally a special problem is assigned to emphasize this further. In allied arts design most of the problems deal with small objects in various materials, involving a consideration of good craftsmanship, which the architect must appreciate if he is to expect it from artisans.

The history of architecture is also of importance in this connection, for the architect must know the experience and inspiration of the past, its successes and failures, that he may better live, think, and build in terms of the present.

Emphasis is placed on modeling and perspective as a corrective and supplement of design in elevation. It develops appreciation of the third dimension and is a means of presentation in itself.

In design, as in all other drawing courses, the right is reserved to keep drawings that may be of help for purposes of illustration or instruction.

98. Architectural Design.—In the courses in architectural design the students work out in the drafting room, designs for a great variety of buildings, ranging from a small structure to large public buildings and groups of buildings. Lectures are given from time to time bearing on the type of building then being designed.

The problems vary from year to year, with the various classes, in order to cover as many as possible of the types of structures which make up architectural practice. Among these are the school, railroad station, library, hospital, church, theatre and auditorium, and such other public structures as the postoffice, museum, the monument, and the bridge, as well as the various kinds of business, manufacturing, and residential buildings. Under “Housing” the entire street plan of a city is worked out: the disposition of
the various sections for commercial, industrial, residential, and recreational purposes, and the actual design of typical buildings of all kinds needed in an entire city.

Problems are occasionally assigned in architectural design which must be completed the same day; usually, however, the problems require from three to five weeks for their completion. A preliminary sketch or study is made by the student without criticism from the instructor or reference to documents; then a general criticism of all these sketches is given before the class, after which the sketches are returned to the students to have the essential features developed in the drafting room under the direction and criticism of instructors. After the drawings have been completed they are hung up and a general criticism is given. Thus, while the character of the instruction is of necessity largely individual, each student may profit by the progress of the others.

The preliminary sketch, usually executed in three or four consecutive hours, compels concentration on essentials and promotes accuracy and facility. The necessity of retaining in the final design the principal characteristics of the first sketch develops a sense of responsibility and individuality, and comparison of the different solutions by members of the class demonstrates the varied possibilities of a given problem. All the designs for a given problem must be handed in at a fixed time. They are then carefully examined by the instructors and graded according to degree of excellence.

Test or examination problems, some without criticism, form a part of the requirement in each course.

In the last design course required of students in Architectural Engineering, problems of a special character for such students are given.

99. Advancement in Design.—Promotion in design is individual, and takes place at any time during the year whenever a student has earned the number of points required in a course. This enables students to progress in proportion to their ability, application, and actual attainment, puts a premium on good work, and stimulates helpful emulation.

While the average student is able to complete the requirements in design in the normal time allowed, students of unusual ability or those who can devote more time to the subject may complete the requirements earlier and then elect additional cultural or technical courses.

100. Allied Arts of Design.—The course in Allied Arts of Design consists of a study of the elements of decorative design; designs are made for a piece of furniture, decorative glass, metal, and mosaic, and for other objects or features commonly used in connection with architecture.
101. **Construction.**—The courses in mathematics and physics are preparatory to those in structural mechanics, the strength and resistance of materials, advanced construction, or structural design, the testing of materials, and the courses in heating and ventilation, and building sanitation. The study of construction continues through two or three years, according to the program of study pursued, and is conducted by means of lectures, textbooks, conferences, visits to buildings, and the preparation of working drawings. The work is at once practical and scientific, analytical and graphical methods being employed, and most of it is completed before the advanced work in architectural design is begun. The character of building materials, their structural and artistic possibilities, and the methods of building practice are studied and problems assigned which train the student in the fundamentals of sound construction.

The drawing work of the course in construction begins with the making of working drawings of a small building. This includes the framing plans of the floors, walls, and roofs, and full-size details of some of the finished portions. This is followed by working drawings for a larger building of heavy construction, and involves soils, foundations, walls, piers, columns, floors, roofs, and details. Steel and reinforced concrete construction are next studied in the course of which girders, columns, trusses, and other structural work of fire-proof buildings are designed. There is a course in the chemistry of engineering materials and one in the testing of materials for students in Program III. The subject of specifications is taken up in connection with the work of construction, and a special course is given in building details.

In these courses, which may most conveniently be grouped under Building Equipment (Heating and Ventilation, and Sanitation), the principles and applications are studied which govern the design of the apparatus, the installation of which forms a part of the architect's work.

102. **History of Architecture.**—Architecture, "the mother art," is an art of great and inspiring traditions, and these can be justly appreciated only through careful study of the monuments of the past, both remote and recent, in relation to the other arts and civilization of their time. Owing to the wealth of material and the possibility of illustration, the history of architecture is one of the richest and most valuable subjects in the architectural curriculum. It is at once cultural and technical in character; it helps inculcate an understanding of the true character of architecture, develops the critical power and taste of the student, and demonstrates how we may best profit by the experience and example of the past.

The development of the art of building is traced from the earliest times to the present day. The causes and influences which
moulded the various modes of building or styles are analyzed and, where possible, demonstrated by means of the stereopticon. Many of the important buildings of the world are fully illustrated and critically studied, the student thus gaining a knowledge of the finest achievements of the art. Not only are the buildings studied in their larger aspects, but also in many of their details of plan, construction and form. The principles of design, the effect of construction and material on form, the value of sculpture, painting, the crafts, and landscape design in relation to architecture are discussed. Decorative sculpture, color, and ornament are considered along with the particular architecture of which they form a part, thus preserving for the student the unity of each style.

In addition to the above, all architectural students registered in Programs I and II elect one or more courses in the history of art, in order to acquaint themselves with the development and masterpieces of painting and sculpture, these courses being more intensive studies in the sculpture, painting, and decorative art of the period.

103. Drawing.—Thorough instruction is provided in descriptive geometry, shades and shadows, perspective and stereotomy. Special classes are provided for architectural students in these subjects. Here the student receives an exacting drill in projections and intersections, accurate and neat instrumental drawing, and learns those methods which are essential to skilled draftsmanship. Many of the problems assigned as illustrations are architectural in character, and thus the student, while learning principles, works out applications directly connected with his chosen field.

104. Freehand Drawing.—Because of the need of facility in this field considerable attention is paid to freehand drawing. The students begin drawing from simple geometrical solids involving the accurate representation of form in line and light and shade; simple decorative, natural, and architectural forms are next drawn, after which proportions of the figure, the hand, foot, etc., are drawn from the living model. Outdoor sketching is also encouraged, and is especially recommended for the summer months, when such instruction is given in the Summer Session.

Throughout this discipline, in the observation and artistic representation of line, form, proportion, light and shade, the aim is to develop in the student the power of free artistic expression. The student is advanced as rapidly as his progress warrants. Pencil and charcoal are principally used.

105. Water-Color and Rendering.—Instruction is given in painting from still life. Almost from the very beginning color is employed in rendering. The continued use of color in render-
ing is insisted on in order to cultivate as much as possible the ability to produce good color relations when dealing with the various materials used in exterior and interior design.

106. **Pen and Ink.**—Rendering in pen and ink is taught for advanced students.

107. **General Studies.**—A fair quota of general studies is provided in the four-year program, the following forming a part of the regular work: English, German or French, the history of art, business administration, and elective hours which permit courses in economics and philosophy or additional courses in language.

Mathematics, physics and geology have considerable importance as liberal studies, as well as being necessary to an understanding of materials, structural mechanics, heating and ventilation, and other technical subjects. Moreover, the study of architecture has a high cultural value in addition to constituting an exacting intellectual discipline.

108. **Summer Work.**—In order to encourage practical experience in architects' offices during the summer vacations, four hours credit is given towards graduation for four months of such work. To the majority of students who enter college without such experience this kind of summer employment, while at first but moderately remunerative, brings home a keen realization of some of the demands of the professional field and results in more serious and better college work. It also enables students upon graduation to adapt themselves more readily to the demands of architectural office routine.

Letters should be brought from architects stating what kind of work was done by the student and how long he was employed.

109. **Summer Session.**—The courses offered for Architectural students and others during the summer of 1930 will include architectural design and outdoor sketching and painting.

The Summer Session will begin June 30.

A Special Announcement of the Summer Session can be had by addressing the Secretary of the University.

110. **Facilities and Equipment.**—The College of Architecture is housed in large and commodious quarters in its own building. The drafting rooms are well lighted, provided with drafting tables of special design, and hung with valuable original competition and measured drawings. The freehand drawing rooms are situated on the top floor at the north side of the building. They have an area of about 5400 square feet, are lighted by means of large north windows, and are fully equipped for the instruction in freehand drawing, pen and ink, water color, and drawing from
life. There is also a room for modeling. A comprehensive collection of plaster casts, of sculpture, of decorative and architectural form, pottery and textiles for painting from still life, and a number of original drawings in pencil, color and pencil, pen and ink, form part of the equipment.

In addition to the above, there are in Alumni Memorial Hall a number of casts from the antique, among which are the Victory of Samothrace, the Hermes of Praxiteles, and some of the remarkable decorative figure sculpture from the Arch of Trajan at Beneventum. Here are also a number of paintings and other objects of artistic and archæological value.

111. Exhibitions.—Each year there is a series of art exhibitions in the Architectural Building. During the past year these consisted of a loan collection from A. C. Goodyear of rare French drawings and lithographs; Wayside Refreshment Stand Competition Designs, from the New York Art Center; sculpture by American artists assembled for exhibition at the Chicago Art Institute; student work from seventeen architectural schools circulated by the Association of Collegiate Schools of Architecture; wood block prints by Elizabeth Keith; drawings and lithographs by Samuel Chamberlain; the National Small Sculpture Exhibition; water colors by Fred W. Henrich; water colors showing views of monuments at Athens, by André Leconte; lithographs of New York skyscrapers by Vernon Howe Bailey; etchings and lithographs by John Marshall and Herbert P. Watts; drawings and water colors of Spain by Vernon Howe Bailey; water colors assembled for a college circuit by the American Federation of Arts. In addition a number of art exhibitions are held each year under the auspices of the Ann Arbor Art Association in the main gallery of the Alumni Memorial Hall.

Exhibitions of student work are held from time to time in the corridor and in classrooms. Work by students of the College was also shown in the circuit exhibition of the Association of Collegiate Schools of Architecture and at the architectural exhibition of the Detroit Institute of Arts.

Many lectures are given each year under the auspices of the University, its colleges and schools, and local organizations, and among these are always a number of especial interest to architectural students.

112. The Library.—No private and few public collections can be as complete as the library of a well-equipped architectural school. These books record the world’s experience and achievement in architecture and allied fields and give an opportunity to study critically the finest work of all periods. The architect must have a fair knowledge of the literature bearing on his art, and since he may never possess many of these valuable works, and
perhaps rarely again see them, the library forms a valued privilege during the student period.

The Architecture Library is conveniently housed in a room 40 x 90 feet on the second floor. It comprises 5,000 bound volumes and folios of plates, including, besides the standard books of reference, many important early works and an unusual number of recent publications, many photographs, and about 15,000 lantern slides. With the works available in the General Library, it constitutes an exceptional collection for the study of construction, architectural design, decorative design, and architectural history. It is especially strong in works on modern architecture and on the allied arts of ceramics, glass, metal work, textiles, and furniture. The leading American and foreign architectural journals are received, and bound volumes are kept on file.

Among the notable works available a few items which call for special mention are: in ancient architecture, the Newton and Marino edition of Vitruvius, Palladio's Fabbriche Antiche, the works of Stuart and Revett, Desgodetz, Cresy and Taylor, Koldewey and Puchstein, the Restaurations des Monuments Antiques, D'Espouy's Monuments Antiques and Fragments d'Architecture Antique, and monographs on a number of Greek and Roman sites and buildings; in medieval architecture, the works of Dehio and von Bezold, Britton, Pugin, Viollet-le-Duc, and the Archives de la Commission des Monuments Historiques; in Renaissance architecture, the works of Geymüller, Raschdorff, Cicognara, Blondel, Gotch, Belcher, and McCartney, and a very full collection of special works on the buildings of the Renaissance in France.

Every reasonable facility is accorded the student. A librarian is always in attendance, the library being open until ten o'clock at night.

The General Library also contains an excellent collection of reference material on painting, sculpture, and archaeology, a large number of photographs of Greek and Roman sculpture, and a collection of nearly five thousand prints, mostly art subject materials.

113. Materials.—The College supplies drawing tables and lockers. The student provides himself with all other materials. A good set of instruments and small drawing boards must be purchased. Water colors should not be purchased until after arrival here, when a list of required colors may be had.

114. State Examinations for the Registration of Architects. Students who are planning to enter the architectural profession should bear in mind that twenty-six states of the Union now have laws prescribing qualifications for architectural practice and require the passing of examinations given by a state board. In a very few years the remaining states will probably have such laws, a number of laws now being under consideration. These
examinations comprise tests in the planning, design, construction, and equipment of buildings. Three or four days are usually required for such examination, distributed about as follows: planning and design, one day; reinforced concrete and steel construction, one day; building equipment and specifications, one-half day; architectural history and truss design, one-half day. Candidates may, by passing a somewhat more difficult examination, given under the National Council of Architectural Registration Boards, qualify for interstate practice.

Architects' Juries.—Again, as during the past few years, visiting architects will be invited to assist in grading design problems.

Association of Collegiate Schools of Architecture.—The College is a charter member of this organization.

115. FELLOWSHIPS, SCHOLARSHIPS, AND HONORS

George G. Booth Traveling Fellowship in Architecture.—This fellowship is awarded annually, the stipend for the year being $1200. To be eligible the candidate must be not more than thirty years of age, and either be a graduate of the College of Architecture of the University of Michigan or have been in residence for, and have substantially completed, the last two years of the four-year course. The award is made on the basis of the student's general record and a competition in design.

Sculpture Prize.—For the year 1930-1931, through a friend of the College of Architecture, a prize of fifty dollars is offered to the student submitting the best work in the course in clay modeling.

Eisenstaedt Award in Drawing and Painting.—Dr. S. Eisenstaedt, Chicago, Illinois, provides annually the sum of one hundred dollars for awards in the classes in drawing and painting in the College of Architecture.

Scholarship of the Detroit Chapter of the American Institute of Architects.—This organization from time to time offers a scholarship varying in amount, open to experienced architectural draftsmen and to those who show decided artistic ability. The scholarship is primarily to encourage graduate study. Application should be made to the Professor of Architecture.

American Academy in Rome.—Graduates in Architecture are admitted to the annual competition for the fellowship in Architecture of the American Academy in Rome. This fellow-
ship entitles the successful candidate to three years' study abroad with a stipend of one thousand dollars per annum.

American Institute of Architecture.—Graduates in Architecture of the University of Michigan are received as candidates for membership by the American Institute of Architects without examination, after they have had a certain amount of training. The Institute has also established a junior membership, open to graduates from this and other recognized schools of the Institute.

Medal of the American Institute of Architects.—The American Institute of Architects annually awards a medal to that member of the graduating class of the College of Architecture having the highest standing during the four-year period of study in Architecture.

116. CREDIT HOURS REQUIRED IN THE THREE FOUR-YEAR PROGRAMS, THE TWO-YEAR PROGRAM FOR SPECIAL STUDENTS, AND THE PROGRAMS IN DECORATIVE DESIGN

One hour of credit represents ordinarily about three hours of actual work during each week of one semester.

#### 120. TWO-YEAR PROGRAM FOR SPECIAL STUDENTS IN ARCHITECTURE

Special students have such varied preparation that a program of courses must practically be planned to meet the needs of each student.

Experienced draftsmen can, in two years, accomplish much in design; they cannot, however, advance far in construction without Mechanics,—Statics (A. 19) and Strength of Materials (A. 20). They are, therefore, advised to bring preparation in high school algebra, trigonometry, and physics, taking Mathematics 3 at the University, then going on with Mechanics,—Architecture 19 and 20. With this training they can elect steel and reinforced concrete construction. Those who desire to specialize in design can sub-

*For Modern Language requirements see section 51.*
stitute other courses for those in mathematics, mechanics, and structural design.

The following is suggested as an outline for special students desiring a well-balanced training when but two years are available:

121. **PROGRAMS IN DECORATIVE DESIGN**

Four majors are outlined in Decorative Design, differentiation in the various groups occurring in the fourth year. Group I is fully established. Groups II, III, and IV are tentative, and represent major options in which it is hoped instruction may be offered soon. The purpose of these courses is to teach the theory and practice of the graphic and decorative arts, the arts and crafts, and interior decoration. For the practice of design, a general education is essential, and proficiency in drawing, color, and modeling is necessary for developing and expressing ideas and presenting them to others.

Instruction in design for technical students begins with Course *Arch. 26, Masonry and Reinforced Concrete, may be substituted.†In addition to the courses listed for this program, students will be required to earn 4 hours credit in practical or other approved work.*
Simple problems illustrating fundamental principles are worked out before studying design in specific materials and fields such as wood, clay, metals, textiles, and glass; and for furniture, decorative painting and sculpture, costume design and stage craft. Surveys will also be given of the historical development.

DESCRIPTION OF COURSES

122. DESCRIPTION OF COURSES IN ARCHITECTURE

Professors Lorch, Rousseau, Wilby, Titcomb, and McConkey; Associate Professor Bennett; Assistant Professors Marshall, Slusser, Fowler, O'Dell, Chapin, and Barnes; Mr. Mathews, Dr. Onderdonk, Mr. Valerio, Mr. Aldrich, Mr. Barnum, Mr. Gamble, Mr. Howe, Mrs. Crane, Mr. Slocum, Mr. Bittinger, Mr. Tanner, Mr. Wood, Mr. Gores, and Mr. Perkins.

ARCHITECTURE

1. Elements of Architecture. An introductory course to the field of artistic design, decorative and architectural. Principles of design and the possibilities in design of line, color, and form. Methods of indication, rendering, lettering. Drawing exercises, modeling and lectures. This course or its equivalent must precede all architectural design courses. Should be accompanied or preceded by Architecture 2 and Freehand Drawing 21. Three hours credit. Each semester.

2. Architectural Drawing. Descriptive geometry; shades and shadows; use of instruments, simple projections and their application to plans, sections and elevations, roof intersections. Three hours credit. Each semester.

3d. Mechanical Drawing. Use of instruments. Simple projections and their application to plans, sections and elevations. For students in Decorative Design. Four hours credit. Each semester.

3. Architectural Drawing. Advanced projections and stereotomy; application to arch and vaulting problems; architectural, isometric and perspective drawing, and modeling. Two hours credit. First semester.

3d. Perspective Drawing for Students in Decorative Design. Prerequisite: Architecture 2d. One hour credit. Second semester.

COURSES IN ARCHITECTURAL DESIGN

In the following courses in Architectural Design problems are assigned to be worked out in the drafting room. Lectures are given from time to time bearing on the type of building then being designed. Study of the requirements of various classes of buildings and of the artistic possibilities of building materials, training of the student in composition in plan, section, elevation, and perspective, and training in accurate draftsmanship and rendering in line, black-and-white, and color.

Courses 4 to 10, inclusive, constitute a progressive series of problems in architectural planning and design, advancing from the
small building to the more important classes of buildings and to
the group problems. The courses must be taken in the order
given.

4. **Architectural Design.** A continuation of Course 1; the
orders and simple problems in design. Illustrated lectures, modeling
and drawing exercises. **Prerequisite:** Architecture 1 and 2,

5. **Architectural Design.** The small ensemble. **Prerequi-
site:** Architecture 4 and 21, and Freehand Drawing 22. Four
hours credit. Each semester.

6. **Architectural Design.** A continuation of Course 5.
Four hours credit. Each semester.

7. **Architectural Design.** Plan problems. **Prerequisite:**

7a. **Architectural Design.** For students in Program III.
Four hours credit. Each semester.

7b. **Architectural Design.** Building details. For students
in Program III. Two hours credit. Each semester.

8. **Architectural Design.** Plan problems. **Prerequisite:**
Architecture 7. Six hours credit. Each semester.

9. **Architectural Design.** Advanced plan problems. **Pre-
requisite:** Architecture 8. Six hours credit. Each semester.

10. **Architectural Design.** Advanced plan problems. **Pre-
requisite:** Architecture 8 or 9. Eight hours credit. Each semes-
ter.

10b. **Architectural Design.** Advanced plan problems and
office practice. **Prerequisite:** Architecture 7. Credit to be ar-
ranged. Each semester.

11. **Architectural Design.** Housing problems. The design
of various types of residential units, single and multiple, and their
relation to the city plan and public health. Lectures, reading, and
drawing. **Prerequisite:** Architecture 6. Credit to be arranged.

**COURSES IN TECHNICAL AND HISTORICAL DEVELOPMENT OF
ARCHITECTURE AND DESIGN**

For students in Architecture, Courses 12, 13, and 14 assume
some knowledge of history, drawing, and design; they should be
elected in the order given. The purpose of these courses is to
study the historical conditions, building materials and methods,
planning and design, as well as the sculptured and painted decoration and ornament of the more important and significant works of architecture. The courses are carried on by means of illustrated lectures, conferences, drawing exercises, research, and required visits to buildings in neighboring cities.

14. **Architectural History Research.** A study of the architectural development of some type of building and the preparation of an illustrated report or thesis. *Prerequisite: Architecture 12 and 13 and two years of architectural design.* Two hours credit. Each semester.

15. **General Course in the History of Architecture.** The aim of this course is to give students seeking a liberal culture a survey of the development of the art of building. The temples, cathedrals, palaces, and other characteristic monuments of the ancient, mediaeval, renaissance, and modern styles, their design, sculpture, and painted decorations will be studied by means of lectures illustrated by the stereopticon, and collateral reading. This course is open to all students in the University, but cannot be counted towards graduation in Architecture. For students of art and archaeology desiring a more intensive study of the technical and historical development of architecture, Courses 12, 13, and 14 are recommended. Two hours credit.

**BUILDING CONSTRUCTION AND EQUIPMENT**

21. **Wood Construction.** Lectures, conferences, drawing, and visits to buildings. Building materials and processes; work-
ing drawings; specifications and estimates of cost. **Prerequisites:** Architecture 1 and 2. Two hours credit. Second semester.

**22. Steel and Fireproof Construction.** Lectures, problems, notes, and assigned reading on building materials, and methods of construction, with particular reference to steel and enclosing and protection materials against fire and other destructive elements. Design of columns, beams, plate girders, and trusses; specifications and estimates. **Prerequisites:** Architecture 19 and 20. Three hours credit. Each semester.

**22a. Structural Theory.** Recitations, problems, text, and occasional lectures. This course is devoted to a study of the laws of statics, moving and stationary loads, influence lines, reactions, shears, and moments in their relation to structures of various kinds. The practical design of beams and girders is given considerable attention. **Prerequisites:** E. M. 1 and 2. Three hours credit. Each semester.

**23. Structural Design: Steel.** Working drawings and details of structures. **Must be preceded or accompanied by Architecture 22.** Two hours credit. Each semester.

**23a. Structural Design.** Lectures and drafting accompanying Architecture 22a. A course in which are considered fundamental principles underlying structural design and their relationship to structural theory. Its main object is to give the student the power to analyze such problems as arise in practice. Elementary forms in wood, cast iron, and steel are considered through the preparation of design and working drawings. Emphasis is laid on the cultivation of careful, systematic, and practical habits in computation. **Must be preceded or accompanied by Architecture 22a.** Two hours credit. Each semester.

**26. Masonry and Reinforced Concrete.** Lectures, problems, text, and assigned reading on building materials and methods of construction, with particular reference to reinforced concrete. Brick, stone, terra cotta, cements, and waterproofing are also considered; specifications and estimates. **Prerequisites:** Architecture 19 and 20. Two hours credit. Each semester.

**27. Structural Design: Masonry.** The design of foundations, columns, slabs, beams, and girders of various types, as used in buildings. **Must be preceded or accompanied by Architecture 26.** Two hours credit. Each semester.
35a. Structural Theory (Advanced). Recitations, problems, text, and lectures. This is an extended course in continuation of Architecture 22a. Part I, nine weeks, treats of the computation and design of structures of wood, metal, and masonry by algebraic and graphical methods. Subjects considered are the theory of columns, trusses of various kinds, mill building bents, and portals, earth pressure, buttresses and retaining walls. Part II, six weeks, treats of the theory of least work, and higher framed structures. The object is to further train the student in the application of the principles of mechanics to the design of structures with special reference to building work. Prerequisites: Architecture 22a and a course in reinforced concrete. Four hours credit. Second semester.

35b. Structural Design (Advanced). Lectures, occasional problems, and drafting. A course in which are prepared complete designs and working drawings of a structural frame building of steel and concrete. Great importance is placed upon the study of the details of the design. Special attention is devoted to types and methods of constructing foundations for buildings, materials of construction, and protection materials against fire and other destructive agencies. Must be preceded by Architecture 23a, and preceded or accompanied by Architecture 35a. Two hours credit. Second semester.

36. Concrete Theory. Recitations, problems, text, and lectures covering theory and design of masonry structures, with particular reference to reinforced concrete. Foundations and flat slab construction are studied. Must be preceded by E. M. 1 and 2, and preceded or accompanied by Architecture 22a. Three hours credit. Each semester.

PRIMARILY FOR GRADUATES

30. Architectural Design. Special problems in planning and design. Prerequisite: Architecture 10 or equivalent.

33. Architectural History. A thesis on the architectural work of a period or on a particular monument. Prerequisite: Architecture 12, 13, and 14 or equivalent.

38. Structural Design. Special problems in building construction. Prerequisite: Architecture 35a or equivalent. Credit to be arranged.

DECORATIVE DESIGN

2. Principles of Design. An introductory study of the theory of design. Lectures and short problems in design. (Formerly Arch. 17.) Prerequisites: Drawing 21 and 22. Architectural students should have completed Architecture 5, and 12 or 13. Three hours credit. Each semester.
3. **Lettering.** Freehand problems in basic letter forms, and lettering design. One hour credit. Each semester.

4. **Theory of Color.** A systematic and intensive study of color and its application in design. Lectures and problems in color and design worked out in the drafting room. (Formerly Arch. 17a.) Three hours credit. Each semester.

6. **Nature and Design.** Design with elements derived from nature. Lectures and design problems. (Formerly Arch. 17b.) Prerequisites: Decorative Design 2 and 4. Three hours credit. Each semester.

8. **Geometric Relations.** A study in the use of various geometric systems in design. (Formerly Arch. 17c.) Prerequisites: Decorative Design 2 and 4. Three hours credit. First semester.

9. **Pattern Design.** The making of patterns appropriate to various purposes and materials. Lectures, drawing and research. (Formerly Arch. 17d.) Prerequisites: Decorative Design 2 and 4. Three hours credit. Second semester.

15. **Color Composition.** Batik; decorative panels and murals. (Formerly Arch. 17e.) Prerequisites: Decorative Design 2 and 4. Two hours credit. Second semester.

21. **History of Applied Arts.** Lectures and research. Three hours credit.

31. **Advanced Color.** Color as applied to various phases of interior problems. (Formerly Arch. 17f.) Prerequisite: Decorative Design 4. Four hours credit.

33. **Architecture and Interior Decoration.** Lectures and drafting room problems. (Formerly Arch. 6d.) Four hours credit.

35. **History of Interiors.** Lectures and library study on the historical development of the design of interiors. One hour credit.

37. **Design of Interiors.** Lectures, drafting room problems, and research dealing with the interior design of important rooms. Eight hours credit.

41. **Costume Design.** History of costume periods. Practical problems in designing costumes. The use of materials; dyeing, painting and stencil in costume. Four hours credit.

43. **Stage Craft.** The design of stage sets. Rendering in models; scenery, costumes, lighting, and properties. Three hours credit.
45. **Color Lighting.** Theory of color and light. Psychology of color. Practical problems in lighting. Two hours credit.

53. **Illustration.** Illustration in black and white and in color. Six hours credit.

57. **Pictorial Advertising.** Poster work. Newspaper, magazine and booklet advertising. Printing processes; layout problems. Three hours credit.

61. **Furniture Design.** The design of furniture; its construction, carving, and finish. Four hours credit.

65. **Design in Crafts.** Practical work in ceramics, metal work, jewelry design, textiles, and leather. Nine hours credit.

**FREEHAND DRAWING, PAINTING, AND MODELING**

The following courses are open to others as well as students in Architecture. The courses are to be elected as Freehand Drawing 21, 22, etc., and in the order given.

All of the courses are offered both semesters and instruction is given in Courses 21 to 26, inclusive, every morning and every afternoon with the exception of Saturday afternoon only.

Drawing is done in charcoal, pencil, and wash, largely from casts and from the living model. This work may be varied somewhat to permit some sketching out-of-doors. Pen and ink should not be elected until after the student has mastered the fundamentals of representation.

For the general student Courses 21, 22, and 24 will give an elementary training in drawing and painting. Course 30 provides more advanced work in painting; Courses 25, 26, and 27 more advanced training in drawing. Course 23 is a special course in the drawing of ornament for students of architecture and decoration, while Course 35 is primarily for students in Architecture, although open to others. Outdoor sketching and painting can best be studied during the Summer Session.

At present there are no classes in portrait painting, but such instruction can, under certain conditions, be arranged for groups of students who have advanced preparation. Still life painting in water color or oil cannot be studied profitably without some preliminary training in freehand drawing (Drawing 21 and 22). For drawing from the living model some preliminary training is required in drawing from antique casts (Drawing 25 and 26).

Advancement in all these courses is individual, depending on the progress made by the student and determined largely by work done without criticism. Advanced standing may be had as in other subjects on the basis of satisfactory work done elsewhere. Drawings should be brought to help determine the student's standing, also letters or certificates from the institution attended.
21. Freehand Drawing. Introductory Course. Drawing from simple forms in line, and light and shade. Freehand perspective. Two hours credit.

23. Freehand Drawing. Drawing from architectural ornament in pencil. Prerequisite: Freehand Drawing 22. Two hours credit.

25. Freehand Drawing. Drawing from antique casts of heads. Two hours credit.

26. Freehand Drawing. Drawing from antique casts of full figure. Two hours credit.

27 and 28. Freehand Drawing. Drawing from life in various media. Admission to these courses is limited to those who have satisfactorily completed the preceding courses or their equivalent. Two hours credit each.

31. Pastel Drawing and Painting. Drawing and painting from still life in pastel. Prerequisite: Freehand Drawing 21 or equivalent. Two hours credit.

32. Painting in Oil. Painting from still life in oil. Prerequisite: Freehand Drawing 24. Two hours credit.

33. Clay Modeling. Two hours credit.

35. Pen and Ink Drawing. Elective. For regular students of Architecture this course must be preceded by Courses 21, 22, and 23 in Drawing, and Architecture 2 and 5. Students not registered in Architecture should have the equivalent of six credit hours in freehand drawing before electing this course. One or two hours credit.

36. Pencil Sketching. Pencil technique, from architecture and landscape. One or two hours credit.

38. Costume Sketch. Drawing from the costumed model in various media. One hour credit.
38a. **Advanced Costume Sketch.** One hour credit.

40. **Pictorial Composition.** The principles of design as applied to illustration, painting, and mural decoration, in black-and-white and in color. One hour credit.

**Summer Session**

**Architectural Design.** Problems to be worked out in the drafting room. Study of the requirements of various classes of buildings and of the artistic possibilities of building materials; training of the student in composition in plan, section, elevation, and perspective, in accurate draftsmanship and rendering in line, black-and-white, and color. The following courses in Architectural Design will be offered:

1. **Introductory Course to the Field of Design.** Drawing exercises, modeling, and lectures. Three hours credit.

4. **Elementary Architectural Design.** Architectural form, drawing, and rendering. Three hours credit.

5 and 6. **Elementary Architectural Design.** A continuation of Course 4; introductory problems in architectural design. Four hours credit.

7 and 8. **Intermediate Architectural Design.** Credit to be arranged.

9 and 10. **Advanced Architectural Design.** Plan problems. Credit to be arranged.

**Freehand Drawing.** B. **Outdoor Drawing and Painting.** Drawing and painting in charcoal, pencil, pastel, water color or oil from landscape and architectural subjects. An effort is made to meet the needs of the individual student so far as possible. Special attention is given to the medium, and to the principles of pictorial composition. Architects may substitute this course for Freehand Drawing 24. **Prerequisite:** Freehand Drawing 21 or equivalent. Two hours credit.

University of Michigan, 27
Unsatisfactory scholarship, 56-57
Upperclassmen, 54-55
Vacations, 5
Ventilating engineering, 200, 211-212
Visits of inspection, 63
Vocational units, 35-37
Water analysis, 73
Water color, 250, 270
Water transportation, 215, 219
Withdrawal from the colleges, 57
Women students, 53
Woodworking laboratory, 108
Work for students, 47
Yost Field House, 51
School of Dentistry, Marcus L. Ward, Dean
(Admission officers: The Dean, for School of Dentistry; Registrar Ira M. Smith, for Curriculum in Oral Hygiene.)
Two years of collegiate preparation required. Three-year professional curriculum; fourth year optional. Fully equipped, modern laboratories and clinic. Abundant clinical material. Graduate work leading to M.S. and D.D.Sc. degrees. One-year curriculum in oral hygiene.

School of Education, J. B. Edmonson, Dean
(Admission officers: The Dean, for two-year curricula, Registrar Ira M. Smith, for four-year curricula.)
Two-year curricula (following two years of prerequisite collegiate preparation) leading to Bachelor of Arts (or Science) in Education, with Life Certificate. Four-year curricula in vocational education, in physical education, athletics, and school health, and in art and design, and a four-year and one-year program in public health nursing.

School of Business Administration, Clare E. Griffin, Dean
(Admission officer: The Dean.)
Three years of collegiate preparation required. Two-year professional curriculum leading to the degree of Master of Business Administration (M.B.A.). Comprehensive programs in all important phases of management. Emphasis upon case work and business research. Combined curriculum with letters, and with forestry.

School of Forestry and Conservation, S. T. Dana, Dean
(Admission officer: The Dean.)
Two years of collegiate preparation required. Two-year curriculum leading to the degree of Bachelor of Forestry or Bachelor of Science in Forestry. Three-year curriculum leading to the degree of Master of Forestry or Master of Science in Forestry. Combined curricula in Forestry and Business Administration, and in Letters and Forestry. Ample opportunity for specialization and research leading to higher degrees.

School of Music, Charles A. Sink, President
(Admission officers: Musical Director Earl V. Moore, for advanced standing; Registrar Ira M. Smith, for freshmen.)
Four years of high school preparation required. Four-year curriculum leading to the degree of Bachelor of Music or Bachelor of Music in Education with teacher's life certificate. Other four-year curriculum leading to diplomas in applied music.

Graduate School, G. Carl Huber, Dean
(Admission officer: The Dean.)
Graduate courses in all departments of study. Special curricula leading to higher degrees in professional subjects.

Summer Session, Edward H. Kraus, Dean
More than five hundred courses in the various Schools and Colleges, leading to all degrees. Special opportunities for advanced and graduate study. Biological Station on Douglas Lake, Northern Michigan; camp for surveying on the Hoback River, near Jackson, Wyoming; field station for geology and geography in Southern Kentucky; and camp for students of Forestry and Conservation in the Upper Peninsula of Michigan.

For Bulletin of General Information and Announcements, address Mr. Ira M. Smith, Registrar of the University.
For general information concerning the University, address Mr. Shirley W. Smith, Secretary and Business Manager of the University, Ann Arbor, Michigan.
UNIVERSITY OF MICHIGAN OFFICIAL PUBLICATION

The University of Michigan Official Publication is the title given to the series of administrative bulletins published by the University. This series includes the following:

FOR PROSPECTIVE STUDENTS

The prospective student should have, in addition to a copy of the Bulletin of General Information, a copy of one or more of the announcements or bulletins listed under this head. These will be sent, without charge, on request to the Registrar of the University.

Bulletin of General Information
Announcements:
College of Literature, Science, and the Arts
Colleges of Engineering and Architecture
Medical School
Law School
College of Pharmacy
School of Dentistry
School of Education
School of Business Administration
School of Forestry and Conservation
Graduate School
University Hospital School of Nursing
University School of Music
Summer Session
Extension Division

Bulletins describing the work of various departments and curricula
