Utilize Our Expertise

The National Archive of Computerized Data on Aging (NACDA) has been collecting, archiving, and distributing data on the aging life course for over 35 years. All of its data are freely available to the research community and many studies provide valuable measures of cognitive change over time.

External Data Resources

NACDA also maintains metadata on external studies such as the HRS, NHATS and SHARE which is useful in identifying data for original research frameworks.

- Health and Retirement Study (HRS)
- Survey of Health, Aging and Retirement in Europe (SHARE)
- National Health and Aging Trends Study (NHATS) [United States]
