

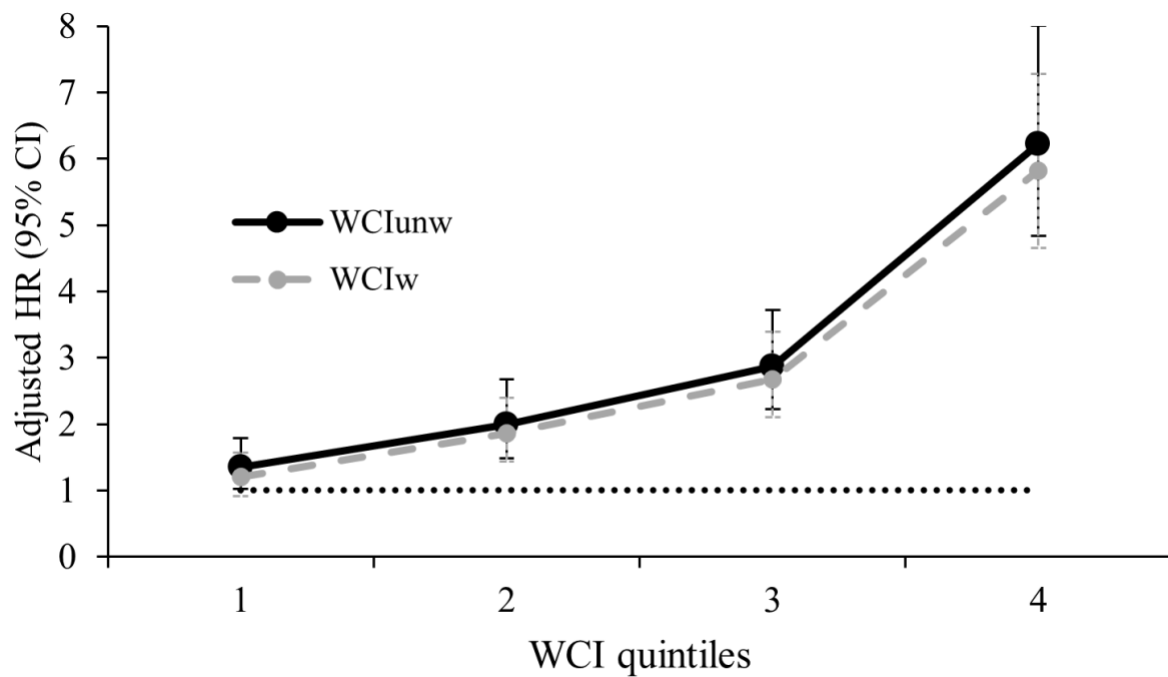

Figure S2:

Line graph shows the adjusted hazard ratio (hazard ratio; filled circle) with 95% confidence intervals (CI; vertical bars) for each of the Whitney Comorbidity Index (WCI) quintiles (reference: lowest quintile) as unweighted (WCI_{unw}) and weighted (WCI_w) with 2-year mortality as the outcome for the entire group ($n=16,728$). Models were adjusted for age (continuous), sex, race, and U.S. region of residence. The dotted horizontal line represents the reference of 1.00 for those in the lowest quintile.
