MONOFUNCTIONAL INTERMEDIATES FOR LIGAND-DEPENDENT TARGET PROTEIN DEGRADATION

BACKGROUND OF THE INVENTION

Field of the Invention

[0001] The present disclosure provides compounds that are medically useful, e.g., as immunomodulators for the treatment of cancer, and/or synthetically useful as monofunctional intermediates for the preparation of small-molecule drug conjugates. Coupling the monofunctional synthetic intermediates of this disclosure with an inhibitor of a target protein of interest, e.g., an oncogenic protein inhibitor, e.g., a BET bromodomain inhibitor or MDM2 inhibitor, provides a heterobifunctional small-molecule that simultaneously binds the target protein and a ubiquitin ligase, enabling ubiquitination and degradation of the target protein.

Background

[0002] Phthalimide-based drugs, e.g., thalidomide or lenalidomide, bind to protein-degradation machinery, e.g., cereblon (CRBN; part of an ubiquitin E3 ligase complex). This may promote the recruitment of two transcription factors (IKZF1 and IKZF3) that are essential to disease progression, resulting in drug-induced ubiquitylation and degradation by the proteasome. See, e.g., Ito et al., Science 327:1345-1350 (2010) and Winter et al., Science 348:1376-1381 (2015).

[0004] There is an ongoing need for immunomodulatory drugs. There is also an ongoing need for monofunctional synthetic intermediates comprising a ligand for an E3 ubiquitin ligase protein, e.g., thalidomide, for use in preparing heterobifunctional protein degraders.
BRIEF SUMMARY OF THE INVENTION

[0005] In one aspect, the present disclosure provides compounds having any one of Formulae I-VI, VIa, or VIb below, and the salts or solvates thereof, collectively referred to as "Compounds of the Disclosure." Compounds of the Disclosure comprise a ligand for an E3 ubiquitin ligase protein and thus can be used as an immunomodulatory drug to treat cancer, e.g., multiple myeloma, and other diseases responsive to inducing, enhancing, or suppressing an immune response, e.g., Crohn's disease, sarcoidosis, graft-versus-host disease, and rheumatoid arthritis, in a subject in need thereof.

[0006] In another aspect, the present disclosure provides Compounds of the Disclosure as monofunctional synthetic intermediates that can be used to prepare heterobifunctional protein degraders.

[0007] In another aspect, the present disclosure provides methods of preparing heterobifunctional protein degraders having any one of Formulae VII-IX or XI-XXXII, below, and the pharmaceutically acceptable salts or solvates thereof. Heterobifunctional protein degraders comprise a target protein inhibitor, a linker, and a ligand for an E3 ubiquitin ligase protein.

[0008] Additional embodiments and advantages of the disclosure will be set forth, in part, in the description that follows, and will flow from the description, or can be learned by practice of the disclosure. The embodiments and advantages of the disclosure will be realized and attained by means of the elements and combinations particularly pointed out in the appended claims.

[0009] It is to be understood that both the foregoing summary and the following detailed description are exemplary and explanatory only, and are not restrictive of the invention as claimed.

[0687] (2) isolating the compound having Formula XXXI, and the pharmaceutically acceptable salts and solvates thereof. 

[0688] Salts, hydrates, and solvates of the Compounds of the Disclosure can also be used in the methods disclosed herein. The present disclosure further includes all possible stereoisomers and geometric isomers of Compounds of the Disclosure to include both racemic compounds and optically active isomers. When a Compound of the Disclosure is desired as a single enantiomer, it can be obtained either by resolution of the final
product or by stereospecific synthesis from either isomerically pure starting material or use of a chiral auxiliary reagent, for example, see Z. Ma et al., *Tetrahedron: Asymmetry*, 8(6), pages 883-888 (1997). Resolution of the final product, an intermediate, or a starting material can be achieved by any suitable method known in the art. Additionally, in situations where tautomers of the Compounds of the Disclosure are possible, the present disclosure is intended to include all tautomeric forms of the compounds.

The present disclosure encompasses the preparation and use of salts of Compounds of the Disclosure and the heterobifunctional target protein degraders prepared from Compounds of the Disclosure, including pharmaceutically acceptable salts. As used herein, the pharmaceutical "pharmaceutically acceptable salt" refers to salts or zwitterionic forms of Compounds of the Disclosure and the heterobifunctional target protein degraders prepared from Compounds of the Disclosure. Salts of Compounds of the Disclosure and the heterobifunctional target protein degraders prepared from Compounds of the Disclosure can be prepared during the final isolation and purification of the compounds or separately by reacting the compound with an acid having a suitable cation. The pharmaceutically acceptable salts of Compounds of the Disclosure and the heterobifunctional target protein degraders prepared from Compounds of the Disclosure can be acid addition salts formed with pharmaceutically acceptable acids. Examples of acids which can be employed to form pharmaceutically acceptable salts include inorganic acids such as nitric, boric, hydrochloric, hydrobromic, sulfuric, and phosphoric, and organic acids such as oxalic, maleic, succinic, and citric. Nonlimiting examples of salts of compounds of the disclosure include, but are not limited to, the hydrochloride, hydrobromide, hydroiodide, sulfate, bisulfate, 2-hydroxyethansulfonate, phosphate, hydrogen phosphate, acetate, adipate, alginate, aspartate, benzoate, bisulfate, butyrate, camphorate, camphorsulfonate, digluconate, glycerolphosphate, hemisulfate, heptanoate, hexanoate, formate, succinate, fumarate, maleate, ascorbate, isethionate, salicylate, methanesulfonate, mesitylenesulfonate, naphthylenesulfonate, nicotinate, 2-naphthalenesulfonate, oxalate, pamoate, pectinate, persulfate, 3-phenylpropionate, picrate, pivalate, propionate, trichloroacetate, trifluoroacetate, phosphate, glutamate, bicarbonate, paratoluenesulfonate, undecanoate, lactate, citrate, tartrate, gluconate, methanesulfonate, ethanedisulfonate, benzene sulfonate, and p-toluene sulfonate salts. In addition, available amino groups present in the compounds of the disclosure can be quaternized with methyl, ethyl, propyl, and butyl chlorides, bromides, and iodides; dimethyl, diethyl, dibutyl, and diamyl sulfates; decyl,
lauryl, myristyl, and steryl chlorides, bromides, and iodides; and benzyl and phenethyl bromides. In light of the foregoing, any reference Compounds of the Disclosure appearing herein is intended to include compounds of Compounds of the Disclosure as well as pharmaceutically acceptable salts, hydrates, or solvates thereof.

The present disclosure encompasses the preparation and use of solvates of Compounds of the Disclosure and the heterobifunctional target protein degraders prepared from Compounds of the Disclosure. Solvates typically do not significantly alter the physiological activity or toxicity of the compounds, and as such may function as pharmacological equivalents. The term "solvate" as used herein is a combination, physical association and/or solvation of a compound of the present disclosure with a solvent molecule such as, e.g. a disolvate, monosolvate or hemisolvate, where the ratio of solvent molecule to compound of the present disclosure is about 2:1, about 1:1 or about 1:2, respectively. This physical association involves varying degrees of ionic and covalent bonding, including hydrogen bonding. In certain instances, the solvate can be isolated, such as when one or more solvent molecules are incorporated into the crystal lattice of a crystalline solid. Thus, "solvate" encompasses both solution-phase and isolatable solvates. Compounds of the Disclosure and the heterobifunctional target protein degraders prepared from Compounds of the Disclosure can be present as solvated forms with a pharmaceutically acceptable solvent, such as water, methanol, and ethanol, and it is intended that the disclosure includes both solvated and unsolvated forms of Compounds of the Disclosure. One type of solvate is a hydrate. A "hydrate" relates to a particular subgroup of solvates where the solvent molecule is water. Solvates typically can function as pharmacological equivalents. Preparation of solvates is known in the art. See, for example, M. Caira et al., J. Pharmaceut. Sci., 93(3):601-611 (2004), which describes the preparation of solvates of fluconazole with ethyl acetate and with water. Similar preparation of solvates, hemisolvates, hydrates, and the like are described by E.C. van Tonder et al., AAPS Pharm. Sci. Tech., 5(1):Article 12 (2004), and A.L. Bingham et al., Chem. Commun. 603-604 (2001). A typical, non-limiting, process of preparing a solvate would involve dissolving a Compound of the Disclosure in a desired solvent (organic, water, or a mixture thereof) at temperatures above 20°C to about 25°C, then cooling the solution at a rate sufficient to form crystals, and isolating the crystals by known methods, e.g., filtration. Analytical techniques such as infrared spectroscopy can be used to confirm the presence of the solvent in a crystal of the solvate.
The present disclosure provides heterobifunctional target protein degraders for the treatment of a variety of diseases and conditions wherein degradation of the target proteins has a beneficial effect. Heterobifunctional target protein degraders typically have a binding affinity (IC₅₀) to the target protein of interest of less than 100 μM, e.g., less than 50 μM, less than 25 μM, and less than 5 μM, less than about 1 μM, less than about 0.5 μM, or less than about 0.1 μM. In one embodiment, the present disclosure relates to a method of treating an individual suffering from a disease or condition wherein degradation of a target protein provides a benefit comprising administering a therapeutically effective amount of a heterobifunctional target protein degrader to an individual in need thereof.

A "monovalent radical of a target protein inhibitor" is derived from the removal of a hydrogen or other suitable atom, e.g., Br, I, or group, e.g., -OH, from a parent protein inhibitor, e.g., an oncogenic protein inhibitor such as BET bromodomain inhibitor or a MDM2 inhibitor. The removal of a hydrogen atom or other suitable atom or group facilitates the linkage of the target protein inhibitor to an E3 ubiquitin ligase protein ligand to give a heterobifunctional compound having Formula IX, as defined above. In one embodiment, a hydrogen atom is removed from any suitable -NH₂ group of the target protein inhibitor. In another embodiment, a hydrogen atom is removed from any suitable -OH group of the target protein inhibitor. In another embodiment, a hydrogen atom is removed from any suitable -N(H)- group of the target protein inhibitor. In another embodiment, a hydrogen atom is removed from any suitable -CH₃, -0¾-, -CH=, or -C≡CH group of the target protein inhibitor. In another embodiment, a Br or I atom is removed from any suitable aryl or heteroaryl group of the target protein inhibitor.

The term "target protein inhibitor" or "parent target protein inhibitor" and the like refers to a compound that disrupts, interferes with, or inhibits protein activity.

The term "oncogenic protein inhibitor" or "parent oncogenic protein inhibitor" and the like refers to a compound that disrupts, interferes with, or inhibits oncogenic protein activity.

"Oncogenic proteins" are proteins encoded by oncogenes (dysregulated or activated genes).

An "oncogene" is any gene that is a causative factor in the initiation of cancerous growth, e.g., a gene that has a potential to cause cancer. For example, transcription
factors, kinases, and growth factors are oncogenic proteins because they are generically involved in signaling systems leading to cell growth, survival, differentiation, and programmed cell death (apoptosis). Other oncogenic proteins include MDM2 and BET bromodomain proteins.

A "monovalent radical of a ligand for an E3 ubiquitin ligase protein" is derived from the removal of a hydrogen or other suitable atom, e.g., Br, I, or group, e.g., -OH, from a parent E3 ubiquitin ligase protein ligand. The removal of a hydrogen atom or other suitable atom or group facilitates the linkage of the parent E3 ubiquitin ligase protein ligand to a target protein inhibitor to give a heterobifunctional compound having Formula IX, as defined above. In one embodiment, a hydrogen atom is removed from any suitable -NH2 group of the parent E3 ubiquitin ligase protein ligand. In another embodiment, a hydrogen atom is removed from any suitable -OH group of the parent E3 ubiquitin ligase protein ligand. In another embodiment, a hydrogen atom is removed from any suitable -N(H)- group of the parent E3 ubiquitin ligase protein ligand. In another embodiment, a hydrogen atom is removed from any suitable -CH3, -CH2-, -CH= group of the parent E3 ubiquitin ligase protein ligand. In another embodiment, the hydrogen atom is removed from any suitable -OH group of the the parent E3 ubiquitin ligase protein ligand. In another embodiment, a Br or I atom is removed from any suitable aryl or heteroaryl group of the parent E3 ubiquitin ligase protein ligand.

Exemplary non-limiting monovalent radicals of E3 ubiquitin ligase protein ligands include:

![Monovalent radicals of E3 ubiquitin ligase protein ligands](image)

Ligands for E3 ubiquitin ligase proteins are known to those of ordinary skill in the art. Exemplary non-limiting ligands for an E3 ubiquitin ligase protein include phthalimide-based drugs such as thalidomide.

In one embodiment, a hydrogen atom is removed from any suitable -NH₂ group of the parent MDM2 inhibitor. In another embodiment, a hydrogen atom is removed from any suitable -OH group of the parent MDM2 inhibitor. In another embodiment, a hydrogen atom is removed from any suitable -N(H)- group of the parent MDM2 inhibitor. This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:

2. 1-52, 55-60, 63-79 (all partially) because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
   see FURTHER INFORMATION sheet PCT/ISA/210

3. Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

This International Searching Authority found multiple inventions in this international application, as follows:

   see additional sheet

1. As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.

2. As all searchable claims could be searched without effort justifying an additional fees, this Authority did not invite payment of additional fees.

3. As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:

4. No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims, it is covered by claims Nos.:

   1-52, 55-60, 63-79 (all partially)

Remark on Protest

- [ ] The additional search fees were accompanied by the applicant's protest and, where applicable, the payment of a protest fee.
- [ ] The additional search fees were accompanied by the applicant's protest but the applicable protest fee was not paid within the time limit specified in the invitation.
- [ ] No protest accompanied the payment of additional search fees.

Continuation of Box II.2

Claims Nos.: 1-52, 55-60, 63-79 (all partially)

The present claims 1-52, 55-60, 63-79 of invention I relate to an extremely large number of possible compounds, pharmaceutical compositions and uses thereof, due to the fact that formulae X, L, Y, B and A 1 to A 3 of claim 1 accordingly contains so many options, variables, possible permutations and provisos. Support and disclosure within the meaning of Article 6 PCT and Article 5 PCT are to be found, however, for only a very small proportion of the compounds claimed, see especially the examples. Non-compliance with the substantive provisions is such that a meaningful search of the whole claimed subject-matter of invention I could not be carried out.

It is furthermore stressed that, the initial phase of the search of invention I revealed a very large number of documents relevant to the issue of novelty. So many documents were retrieved that it is impossible to determine which parts of claim 1 according to invention 1 may be said to define subject-matter for which protection might legitimately be sought. For these reasons, a meaningful search of the whole claimed subject-matter of invention I could not be carried out. The extent of the search was consequently restricted to those claimed compounds, which appear to be supported and to a generalisation of their structural formulae, namely compounds wherein: X means an alicyclic moiety; Y is always present; R 5 is hydrogen and A 1 to A 3 mean a carbon atom.

The applicant's attention is drawn to the fact that claims relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure. If the application proceeds into the regional phase before the EPO, the applicant is reminded that a search may be carried out during examination before the EPO (see EPO Guidelines C-IV, 7.2), should the problems which led to the Article 17(2) declaration be overcome.
