## MDM2 PROTEIN DEGRADERS

## BACKGROUND OF THE INVENTION

## Field of the Invention

[0001] The present disclosure provides MDM2 protein degraders and therapeutic methods of treating conditions and diseases wherein degradation of MDM2 provides a benefit

## Background

[0002] The p53 tumor suppressor is a principal mediator of growth arrest, senescence, and apoptosis in response to a broad array of cellular damage. Rapid induction of high p53 protein levels by various stress types prevents inappropriate propagation of cells carrying potentially mutagenic, damaged DNA. p53 can kill cells via a dual transcription-dependent and -independent function in the nucleus and at the mitochondria. It has been demonstrated that cellular p53 protein levels are the single most important determinant of its function. In normal unstressed cells, p53 is a very unstable protein with a half-life ranging from 5 to 30 min , which is present at very low cellular levels owing to continuous degradation largely mediated by MDM2. Conversely, a hallmark of many cellular stress pathways such as DNA damage, hypoxia, telomere shortening, and oncogene activation is the rapid stabilization of p53 via a block of its degradation. MDM2 has emerged as the principal cellular antagonist of p53 by limiting the p53 tumor suppressor function. Moll and Petrenko, Molecular Cancer Research 1:1001-1008 (2003).
[0003] MDM2 is transcriptionally activated by p53 and MDM2, in turn, inhibits p53 activity by at least three mechanisms. Wu et al., Genes Dev. 7:1126 (1993). First, MDM2 protein directly binds to the p53 transactivation domain and thereby inhibits p53-mediated transactivation. Second, MDM2 protein contains a nuclear export signal sequence, and upon binding to p 53 , induces the nuclear export of p53, preventing p53 from binding to the targeted DNAs. Third, MDM2 protein is an E3 ubiquitin ligase and upon binding to p 53 is able to promote p53 degradation.
[0004] Small-molecule inhibitors that target the p53-MDM2 interaction have therapeutic potential for treating cancer and other diseases. Chene, Nat. Rev. Cancer 3:102 (2003)
and Vassilev et al., Science 303:844 (2004). Antagonists of the p53-MDM2 interaction are described in U.S. Patent Nos. 7,759,383; 7,737,174; 8,518,984; 8,680,132; 8,629,141; $6,617,346 ; 6,734,302 ; 7,132,421 ; 7,425,638 ; 7,579,368 ; 7,060,713 ; 7,553,833 ;$ 6,916,833; 7,495,007; 7,638,548; 7,576,082; 7,625,895; and 7,083,983; and U.S. Patent Application Publication Nos. 2005/0288287; 2009/0143364; 2009/0312310; 2006/0211718; 2010/0048593; 2005/0227932; 2008/0261917; 2009/0227542; 2008/0171723; 2006/0211757; 2005/0137137; 2002/0132977; and 2009/0030181.
[0005] Phthalimide-based drugs, e.g., thalidomide or lenalidomide, bind to protein-degradation machinery, e.g., cereblon (CRBN; part of an ubiquitin E3 ligase complex). This may promote the recruitment of two transcription factors (IKZF1 and IKZF3) that are essential to disease progression, resulting in drug-induced ubiquitylation and degradation by the proteasome. See, e.g., Ito et al., Science 327:1345-1350 (2010) and Winter et al., Science 348:1376-1381 (2015).
[0006] A high-affinity VHL ligand, see Bondeson et al., Nat. Chem. Biol. 11:611-617 (2015), may recruit a target protein to an E3 ubiquitin ligase, resulting in drug induced ubiquitination and degradation. See, e.g., van Hagen et al., Nucleic Acids Research 38: 1922-1931 (2010); Buckley et al., J. Am. Chem. Soc. 134:4465-4468 (2012); Buckley et al., Angew, Chem. Int. Ed. Engl. 51:11463-11467 (2012); Lipkowitz and Weissman, Nat Rev Cancer 11:629-643 (2011); and Zengerle et al., ACS Chem. Biol. 10:1770-1777 (2015).
[0007] There is an ongoing need for new agents, e.g., small molecules, for treating cancer and other diseases responsive to the disruption or prevention of the MDM2-p53 interaction.

[0617] Compounds of the Disclosure degrade MDM2 proteins and are useful in the treatment of a variety of diseases and conditions. In particular, Compounds of the Disclosure are useful in methods of treating a disease or condition wherein degradation MDM2 proteins provides a benefit, for example, cancers and proliferative diseases. The therapeutic methods of the disclosure comprise administering a therapeutically effective amount of a Compound of the Disclosure to an individual in need thereof. The present methods also encompass administering a second therapeutic agent to the individual in addition to the Compound of the Disclosure. The second therapeutic agent is selected from drugs known as useful in treating the disease or condition afflicting the individual in need thereof, e.g., a chemotherapeutic agent and/or radiation known as useful in treating a particular cancer.
[0618] Salts, hydrates, and solvates of the Compounds of the Disclosure can also be used in the methods disclosed herein. The present disclosure further includes all possible stereoisomers and geometric isomers of Compounds of the Disclosure to include both racemic compounds and optically active isomers. When a Compound of the Disclosure is desired as a single enantiomer, it can be obtained either by resolution of the final product or by stereospecific synthesis from either isomerically pure starting material or use of a chiral auxiliary reagent, for example, see Z. Ma et al., Tetrahedron: Asymmetry, 8(6), pages 883-888 (1997). Resolution of the final product, an intermediate, or a starting material can be achieved by any suitable method known in the art. Additionally, in situations where tautomers of the Compounds of the Disclosure are possible, the present disclosure is intended to include all tautomeric forms of the compounds.
[0619] The present disclosure encompasses the preparation and use of salts of Compounds of the Disclosure. As used herein, the pharmaceutical "pharmaceutically acceptable salt" refers to salts or zwitterionic forms of Compounds of the Disclosure. Salts of Compounds of the Disclosure can be prepared during the final isolation and purification of the compounds or separately by reacting the compound with a suitable acid. The pharmaceutically acceptable salts of Compounds of the Disclosure can be acid addition salts formed with pharmaceutically acceptable acids. Examples of acids which can be employed to form pharmaceutically acceptable salts include inorganic acids such as nitric, boric, hydrochloric, hydrobromic, sulfuric, and phosphoric, and organic acids
such as oxalic, maleic, succinic, and citric. Non-limiting examples of salts of compounds of the disclosure include, but are not limited to, the hydrochloride, hydrobromide, hydroiodide, sulfate, bisulfate, 2-hydroxyethansulfonate, phosphate, hydrogen phosphate, acetate, adipate, alginate, aspartate, benzoate, bisulfate, butyrate, camphorate, camphorsulfonate, digluconate, glycerolphsphate, hemisulfate, heptanoate, hexanoate, formate, succinate, fumarate, maleate, ascorbate, isethionate, salicylate, methanesulfonate, mesitylenesulfonate, naphthylenesulfonate, nicotinate, 2-naphthalenesulfonate, oxalate, pamoate, pectinate, persulfate, 3-phenylproprionate, picrate, pivalate, propionate, trichloroacetate, trifluoroacetate, phosphate, glutamate, bicarbonate, paratoluenesulfonate, undecanoate, lactate, citrate, tartrate, gluconate, methanesulfonate, ethanedisulfonate, benzene sulfonate, and p-toluenesulfonate salts. In addition, available amino groups present in the compounds of the disclosure can be quaternized with methyl, ethyl, propyl, and butyl chlorides, bromides, and iodides; dimethyl, diethyl, dibutyl, and diamyl sulfates; decyl, lauryl, myristyl, and steryl chlorides, bromides, and iodides; and benzyl and phenethyl bromides. In light of the foregoing, any reference Compounds of the Disclosure appearing herein is intended to include compounds of Compounds of the Disclosure as well as pharmaceutically acceptable salts, hydrates, or solvates thereof.
[0620] The present disclosure encompasses the preparation and use of solvates of Compounds of the Disclosure. Solvates typically do not significantly alter the physiological activity or toxicity of the compounds, and as such may function as pharmacological equivalents. The term "solvate" as used herein is a combination, physical association and/or solvation of a compound of the present disclosure with a solvent molecule such as, e.g. a disolvate, monosolvate or hemisolvate, where the ratio of solvent molecule to compound of the present disclosure is about \(2: 1\), about \(1: 1\) or about \(1: 2\), respectively. This physical association involves varying degrees of ionic and covalent bonding, including hydrogen bonding. In certain instances, the solvate can be isolated, such as when one or more solvent molecules are incorporated into the crystal lattice of a crystalline solid. Thus, "solvate" encompasses both solution-phase and isolatable solvates. Compounds of the Disclosure can be present as solvated forms with a pharmaceutically acceptable solvent, such as water, methanol, and ethanol, and it is intended that the disclosure includes both solvated and unsolvated forms of Compounds of the Disclosure. One type of solvate is a hydrate. A "hydrate" relates to a particular subgroup of solvates where the solvent molecule is water. Solvates typically can
function as pharmacological equivalents. Preparation of solvates is known in the art See, for example, M. Caira et al, J. Pharmaceut. Sci., 93(3):601-611 (2004), which describes the preparation of solvates of fluconazole with ethyl acetate and with water. Similar preparation of solvates, hemisolvates, hydrates, and the like are described by E.C. van Tonder et al., AAPS Pharm. Sci. Tech., 5(1):Article 12 (2004), and A.L. Bingham et al., Chem. Commun. 603-604 (2001). A typical, non-limiting, process of preparing a solvate would involve dissolving a Compound of the Disclosure in a desired solvent (organic, water, or a mixture thereof) at temperatures above \(20^{\circ} \mathrm{C}\) to about \(25^{\circ} \mathrm{C}\), then cooling the solution at a rate sufficient to form crystals, and isolating the crystals by known methods, e.g., filtration. Analytical techniques such as infrared spectroscopy can be used to confirm the presence of the solvent in a crystal of the solvate.
[0621] A "monovalent radical of a ligand for an E3 ubiquitin ligase protein" is derived from the removal of a hydrogen or other suitable atom, e.g., \(\mathrm{Br}, \mathrm{I}\), or group, e.g., -OH, from a parent E3 ubiquitin ligase protein ligand. The removal of a hydrogen atom or other suitable atom or group facilitates the linkage of the parent E3 ubiquitin ligase protein ligand to a target protein inhibitor to give a heterobifunctional compound having any one of Formulae I-A or I-III, as defined above. In one embodiment, a hydrogen atom is removed from any suitable \(-\mathrm{NH}_{2}\) group of the parent E3 ubiquitin ligase protein ligand. In another embodiment, a hydrogen atom is removed from any suitable - OH group of the parent E3 ubiquitin ligase protein ligand. In another embodiment, a hydrogen atom is removed from any suitable \(-\mathrm{N}(\mathrm{H})\) - group of the parent E3 ubiquitin ligase protein ligand. In another embodiment, a hydrogen atom is removed from any suitable \(-\mathrm{CH}_{3},-\mathrm{CH}_{2}\), \(-\mathrm{CH}=\) group of the parent E 3 ubiquitin ligase protein ligand. In another embodiment, a Br or I atom is removed from any suitable aryl or heteroaryl group of the parent E3 ubiquitin ligase protein ligand. Exemplary non-limiting monovalent radicals of E3 ubiquitin ligase protein ligands include:

[0622] A "ligand for an E3 ubiquitin ligase protein" or "parent ligand for an E3 ubiquitin ligase protein" or "E3 ubiquitin ligase protein ligand" and the like refers to a compound that binds, e.g., inhibits, an E3 ubiquitin ligase protein, including the von Hippel-Lindau protein (VHL). Ligands for E3 ubiquitin ligase proteins are known to those of ordinary skill in the art. Exemplary non-limiting ligands for an E3 ubiquitin ligase protein include phthalimide-based drugs such as thalidomide.
[0623] A "monovalent radical of a MDM2 inhibitor" is derived from the removal of a hydrogen or other suitable atom, e.g., Br, I, or group, e.g., -OH , from a parent MDM2 inhibitor. The removal of a hydrogen atom or other suitable atom or group facilitates the linkage of the MDM2 inhibitor to an E3 ubiquitin ligase protein ligand to give a heterobifunctional compound having any one of Formulae I-A or I-III, as defined above. In one embodiment, a hydrogen atom is removed from any suitable \(-\mathrm{NH}_{2}\) group of the parent MDM2 inhibitor. In another embodiment, a hydrogen atom is removed from any suitable -OH group of the parent MDM2 inhibitor. In another embodiment, a hydrogen atom is removed from any suitable \(-\mathrm{N}(\mathrm{H})\) - group of the parent MDM2 inhibitor. In another embodiment, a hydrogen atom is removed from any suitable \(-\mathrm{CH}_{3},-\mathrm{CH}_{2}-,-\mathrm{CH}=\), or \(-\mathrm{C} \equiv \mathrm{CH}\) group of the parent MDM2 inhibitor. In another embodiment, the hydrogen
atom is removed from any suitable - OH group of the parent MDM2 inhibitor. In another embodiment, the - OH group is removed from any suitable \(-\mathrm{C}(=\mathrm{O}) \mathrm{OH}\) group of the parent MDM2 inhibitor. In another embodiment, a Br or I atom is removed from any suitable aryl or heteroaryl group of the parent MDM2 inhibitor.
[0624] A "linker" is a divalent chemical moiety that joins a monovalent radical of a ligand for an E3 ubiquitin ligase protein and a monovalent radical of a MDM2 inhibitor.
[0625] A "MDM2 inhibitor" or "parent MDM2 inhibitor" and the like refer to a compound that disrupts the p53-MDM2 interaction and/or interferes with MDM2 activity. MDM2 inhibitors are known to those of ordinary skill in the art. See, e.g., Shangary. et al., Annual Review Of Pharmacology and Toxicology 49: 223-241 (2009); and Weber, Expert Opinion On Therapeutic Patents 20: 179-191 (2010).

In a particular embodiment, the cis-imidazoline is Nutlin-1, Nutlin-2, or Nutlin3 (Chart 3; see Vassilev, L.T. et al., Science 303:844-848 (2004)).

[0684] The present disclosure provides Compounds of the Disclosure as MDM2 protein degraders for the treatment of a variety of diseases and conditions wherein degradation of MDM2 proteins has a beneficial effect. Compounds of the Disclosure typically have a binding affinity \(\left(\mathrm{IC}_{50}\right)\) to MDM2 of less than \(100 \mu \mathrm{M}\), e.g., less than \(50 \mu \mathrm{M}\), less than \(25 \mu \mathrm{M}\), and less than \(5 \mu \mathrm{M}\), less than about \(1 \mu \mathrm{M}\), less than about \(0.5 \mu \mathrm{M}\), or less than about \(0.1 \mu \mathrm{M}\). In one embodiment, the present disclosure relates to a method of treating an individual suffering from a disease or condition wherein degradation of MDM2 proteins provides a benefit comprising administering a therapeutically effective amount of a Compound of the Disclosure to an individual in need thereof.
[0685] Since Compounds of the Disclosure are degraders of MDM2 protein, a number of diseases and conditions mediated by MDM2 can be treated by employing these compounds. The present disclosure is thus directed generally to a method for treating a condition or disorder responsive to degradation of MDM2, in an animal, e.g., a human, suffering from, or at risk of suffering from, the condition or disorder, the method comprising administering to the animal an effective amount of one or more Compounds of the Disclosure.
[0686]
The present disclosure is further directed to a method of degrading MDM2 protein in an animal in need thereof, said method comprising administering to the animal an effective amount of at least one Compound of the Disclosure.
[0687] The methods of the present disclosure can be accomplished by administering a Compound of the Disclosure as the neat compound or as a pharmaceutical composition. Administration of a pharmaceutical composition, or neat compound of a Compound of the Disclosure, can be performed during or after the onset of the disease or condition of interest. Typically, the pharmaceutical compositions are sterile, and contain no toxic, carcinogenic, or mutagenic compounds that would cause an adverse reaction when administered. Further provided are kits comprising a Compound of the Disclosure and, optionally, a second therapeutic agent useful in the treatment of diseases and conditions wherein degradation of MDM2 protein provides a benefit, packaged separately or together, and an insert having instructions for using these active agents.
[0688] In one embodiment, a Compound of the Disclosure is administered in conjunction with a second therapeutic agent useful in the treatment of a disease or condition wherein degradation of MDM2 protein provides a benefit. The second therapeutic agent is different from the Compound of the Disclosure. A Compound of the Disclosure and the second therapeutic agent can be administered simultaneously or sequentially to achieve the desired effect. In addition, the Compound of the Disclosure and second therapeutic agent can be administered from a single composition or two separate compositions.

The second therapeutic agent is administered in an amount to provide its desired therapeutic effect. The effective dosage range for each second therapeutic agent is known in the art, and the second therapeutic agent is administered to an individual in need thereof within such established ranges.
[0690] A Compound of the Disclosure and the second therapeutic agent can be administered together as a single-unit dose or separately as multi-unit doses, wherein the Compound of the Disclosure is administered before the second therapeutic agent or vice versa. One or more doses of the Compound of the Disclosure and/or one or more dose of the second therapeutic agent can be administered. The Compound of the Disclosure therefore can be used in conjunction with one or more second therapeutic agents, for example, but not limited to, anticancer agents.
[0691] Diseases and conditions treatable by the methods of the present disclosure include, but are not limited to, cancer and other proliferative disorders, inflammatory diseases, sepsis, autoimmune disease, and viral infection. In one embodiment, a human
patient is treated with a Compound of the Disclosure, or a pharmaceutical composition comprising a Compound of the Disclosure, wherein the compound is administered in an amount sufficient to degrade MDM2 protein in the patient.
[0692] In one embodiment, the disease to be treated by the Compound of the Disclosure is cancer. Examples of treatable cancers include, but are not limited to, any one or more of the cancers of Table 9 .

[0700] In methods of the present disclosure, a therapeutically effective amount of a Compound of the Disclosure, typically formulated in accordance with pharmaceutical practice, is administered to a human being in need thereof. Whether such a treatment is indicated depends on the individual case and is subject to medical assessment (diagnosis) that takes into consideration signs, symptoms, and/or malfunctions that are present, the risks of developing particular signs, symptoms and/or malfunctions, and other factors.
[0701] A Compound of the Disclosure can be administered by any suitable route, for example by oral, buccal, inhalation, sublingual, rectal, vaginal, intracisternal or intrathecal through lumbar puncture, transurethral, nasal, percutaneous, i.e., transdermal, or parenteral (including intravenous, intramuscular, subcutaneous, intracoronary, intradermal, intramammary, intraperitoneal, intraarticular, intrathecal, retrobulbar, intrapulmonary injection and/or surgical implantation at a particular site) administration. Parenteral administration can be accomplished using a needle and syringe or using a high pressure technique.
[0702] Pharmaceutical compositions include those wherein a Compound of the Disclosure is administered in an effective amount to achieve its intended purpose. The exact formulation, route of administration, and dosage is determined by an individual physician in view of the diagnosed condition or disease. Dosage amount and interval can be adjusted individually to provide levels of a Compound of the Disclosure that is sufficient to maintain therapeutic effects.
[0703] Toxicity and therapeutic efficacy of the Compounds of the Disclosure can be determined by standard pharmaceutical procedures in cell cultures or experimental animals, e.g., for determining the maximum tolerated dose (MTD) of a compound, which defines as the highest dose that causes no toxicity in animals. The dose ratio between the maximum tolerated dose and therapeutic effects (e.g. inhibiting of tumor growth) is the therapeutic index. The dosage can vary within this range depending upon the dosage form employed, and the route of administration utilized. Determination of a therapeutically effective amount is well within the capability of those skilled in the art, especially in light of the detailed disclosure provided herein.
[0704]
A therapeutically effective amount of a Compound of the Disclosure required for use in therapy varies with the nature of the condition being treated, the length of time that
activity is desired, and the age and the condition of the patient, and ultimately is determined by the attendant physician. Dosage amounts and intervals can be adjusted individually to provide plasma levels of the MDM2 protein degrader that are sufficient to maintain the desired therapeutic effects. The desired dose conveniently can be administered in a single dose, or as multiple doses administered at appropriate intervals, for example as one, two, three, four or more subdoses per day. Multiple doses often are desired, or required. For example, a Compound of the Disclosure can be administered at a frequency of: four doses delivered as one dose per day at four-day intervals ( \(q 4 d \times 4\) ); four doses delivered as one dose per day at three-day intervals ( \(\mathrm{q} 3 \mathrm{~d} x 4\) ); one dose delivered per day at five-day intervals (qd x 5); one dose per week for three weeks (qwk3); five daily doses, with two days rest, and another five daily doses ( \(5 / 2 / 5\) ); or, any dose regimen determined to be appropriate for the circumstance.
[0705] A Compound of the Disclosure used in a method of the present disclosure can be administered in an amount of about 0.005 to about 500 milligrams per dose, about 0.05 to about 250 milligrams per dose, or about 0.5 to about 100 milligrams per dose. [0735]
The above-mentioned second therapeutically active agents, one or more of which can be used in combination with a Compound of the Disclosure, are prepared and administered as described in the art.
[0736]
Compounds of the Disclosure typically are administered in admixture with a pharmaceutical carrier selected with regard to the intended route of administration and standard pharmaceutical practice. Pharmaceutical compositions for use in accordance with the present disclosure are formulated in a conventional manner using one or more physiologically acceptable carriers comprising excipients and/or auxiliaries that facilitate processing of Compound of the Disclosure.
[0737]
These pharmaceutical compositions can be manufactured, for example, by conventional mixing, dissolving, granulating, dragee-making, emulsifying, encapsulating, entrapping, or lyophilizing processes. Proper formulation is dependent upon the route of
administration chosen. When a therapeutically effective amount of the Compound of the Disclosure is administered orally, the composition typically is in the form of a tablet, capsule, powder, solution, or elixir. When administered in tablet form, the composition additionally can contain a solid carrier, such as a gelatin or an adjuvant. The tablet, capsule, and powder contain about \(0.01 \%\) to about \(95 \%\), and preferably from about \(1 \%\) to about \(50 \%\), of a Compound of the Disclosure. When administered in liquid form, a liquid carrier, such as water, petroleum, or oils of animal or plant origin, can be added. The liquid form of the composition can further contain physiological saline solution, dextrose or other saccharide solutions, or glycols. When administered in liquid form, the composition contains about \(0.1 \%\) to about \(90 \%\), and preferably about \(1 \%\) to about \(50 \%\), by weight, of a Compound of the Disclosure.
[0738] When a therapeutically effective amount of a Compound of the Disclosure is administered by intravenous, cutaneous, or subcutaneous injection, the composition is in the form of a pyrogen-free, parenterally acceptable aqueous solution. The preparation of such parenterally acceptable solutions, having due regard to pH , isotonicity, stability, and the like, is within the skill in the art. A preferred composition for intravenous, cutaneous, or subcutaneous injection typically contains, an isotonic vehicle.
[0739] Compounds of the Disclosure can be readily combined with pharmaceutically acceptable carriers well-known in the art. Standard pharmaceutical carriers are described in Remington's Pharmaceutical Sciences, Mack Publishing Co., Easton, PA, 19th ed. 1995. Such carriers enable the active agents to be formulated as tablets, pills, dragees, capsules, liquids, gels, syrups, slurries, suspensions and the like, for oral ingestion by a patient to be treated. Pharmaceutical preparations for oral use can be obtained by adding the Compound of the Disclosure to a solid excipient, optionally grinding the resulting mixture, and processing the mixture of granules, after adding suitable auxiliaries, if desired, to obtain tablets or dragee cores. Suitable excipients include, for example, fillers and cellulose preparations. If desired, disintegrating agents can be added.
[0740] Compound of the Disclosure can be formulated for parenteral administration by injection, e.g., by bolus injection or continuous infusion. Formulations for injection can be presented in unit dosage form, e.g., in ampules or in multidose containers, with an added preservative. The compositions can take such forms as suspensions, solutions, or emulsions in oily or aqueous vehicles, and can contain formulatory agents such as suspending, stabilizing, and/or dispersing agents.

Pharmaceutical compositions for parenteral administration include aqueous solutions of the active agent in water-soluble form. Additionally, suspensions of a Compound of the Disclosure can be prepared as appropriate oily injection suspensions. Suitable lipophilic solvents or vehicles include fatty oils or synthetic fatty acid esters. Aqueous injection suspensions can contain substances which increase the viscosity of the suspension. Optionally, the suspension also can contain suitable stabilizers or agents that increase the solubility of the compounds and allow for the preparation of highly concentrated solutions. Alternatively, a present composition can be in powder form for constitution with a suitable vehicle, e.g., sterile pyrogen-free water, before use.
[0742] Compounds of the Disclosure also can be formulated in rectal compositions, such as suppositories or retention enemas, e.g., containing conventional suppository bases. In addition to the formulations described previously, the Compound of the Disclosure also can be formulated as a depot preparation. Such long-acting formulations can be administered by implantation (for example, subcutaneously or intramuscularly) or by intramuscular injection. Thus, for example, the Compound of the Disclosure can be formulated with suitable polymeric or hydrophobic materials (for example, as an emulsion in an acceptable oil) or ion exchange resins.
[0743] In particular, the Compounds of the Disclosure can be administered orally, buccally, or sublingually in the form of tablets containing excipients, such as starch or lactose, or in capsules or ovules, either alone or in admixture with excipients, or in the form of elixirs or suspensions containing flavoring or coloring agents. Such liquid preparations can be prepared with pharmaceutically acceptable additives, such as suspending agents. Compound of the Disclosure also can be injected parenterally, for example, intravenously, intramuscularly, subcutaneously, or intracoronarily. For parenteral administration, the Compound of the Disclosure are typically used in the form of a sterile aqueous solution which can contain other substances, for example, salts or monosaccharides, such as mannitol or glucose, to make the solution isotonic with blood.

In another embodiment, the present disclosure provides kits which comprise a Compound of the Disclosure (or a composition comprising a Compound of the Disclosure) packaged in a manner that facilitates their use to practice methods of the present disclosure. In one embodiment, the kit includes a Compound of the Disclosure (or a composition comprising a Compound of the Disclosure) packaged in a container, such as a sealed bottle or vessel, with a label affixed to the container or included in the kit that describes use of the compound or composition to practice the method of the
disclosure. In one embodiment, the compound or composition is packaged in a unit dosage form. The kit further can include a device suitable for administering the composition according to the intended route of administration.
[0745] The term "a disease or condition wherein degradation of MDM2 protein provides a benefit" pertains to a disease or condition in which MDM2 and/or an action of MDM2 is important or necessary, e.g., for the onset, progress, expression of that disease or condition, or a disease or a condition which is known to be treated by a MDM2 inhibitor or degrader. Examples of such conditions include, but are not limited to, a cancer, a chronic autoimmune disease, an inflammatory disease, a proliferative disease, sepsis, and a viral infection. One of ordinary skill in the art is readily able to determine whether a compound treats a disease or condition mediated by MDM2 for any particular cell type, for example, by assays which conveniently can be used to assess the activity of particular compounds.
[0746] The term "second therapeutic agent" refers to a therapeutic agent different from a Compound of the Disclosure and that is known to treat the disease or condition of interest. For example when a cancer is the disease or condition of interest, the second therapeutic agent can be a known chemotherapeutic drug, like taxol, or radiation, for example.
[0747] The term "disease" or "condition" denotes disturbances and/or anomalies that as a rule are regarded as being pathological conditions or functions, and that can manifest themselves in the form of particular signs, symptoms, and/or malfunctions. As demonstrated in the examples below, a Compound of the Disclosure is a degrader of MDM2 protein and can be used in treating diseases and conditions wherein degradation of MDM2 provides a benefit.
[0748] As used herein, the terms "treat," "treating," "treatment," refer to eliminating, reducing, or ameliorating a disease or condition, and/or symptoms associated therewith. Although not precluded, treating a disease or condition does not require that the disease, condition, or symptoms associated therewith be completely eliminated. As used herein, the terms "treat," "treating," "treatment," may include "prophylactic treatment," which refers to reducing the probability of redeveloping a disease or condition, or of a recurrence of a previously-controlled disease or condition, in a subject who does not have, but is at risk of or is susceptible to, redeveloping a disease or condition or a recurrence of the disease or condition. The term "treat" and synonyms contemplate
administering a therapeutically effective amount of a Compound of the Disclosure to an individual in need of such treatment.
[0749]
Within the meaning of the disclosure, "treatment" also includes relapse prophylaxis or phase prophylaxis, as well as the treatment of acute or chronic signs, symptoms and/or malfunctions. The treatment can be orientated symptomatically, for example, to suppress symptoms. It can be effected over a short period, be oriented over a medium term, or can be a long-term treatment, for example within the context of a maintenance therapy.
[0750] The term "therapeutically effective amount" or "effective dose" as used herein refers to an amount of the active ingredient(s) that is(are) sufficient, when administered by a method of the disclosure, to efficaciously deliver the active ingredient(s) for the treatment of condition or disease of interest to an individual in need thereof. In the case of a cancer or other proliferation disorder, the therapeutically effective amount of the agent may reduce (i.e., retard to some extent and preferably stop) unwanted cellular proliferation; reduce the number of cancer cells; reduce the tumor size; inhibit (i.e., retard to some extent and preferably stop) cancer cell infiltration into peripheral organs; inhibit (i.e., retard to some extent and preferably stop) tumor metastasis; inhibit, to some extent, tumor growth; reduce MDM2 signaling in the target cells; and/or relieve, to some extent, one or more of the symptoms associated with the cancer. To the extent the administered compound or composition prevents growth and/or kills existing cancer cells, it may be cytostatic and/or cytotoxic.
[0751] The term "container" means any receptacle and closure therefore suitable for storing, shipping, dispensing, and/or handling a pharmaceutical product.
[0752]
The term "insert" means information accompanying a pharmaceutical product that provides a description of how to administer the product, along with the safety and efficacy data required to allow the physician, pharmacist, and patient to make an informed decision regarding use of the product. The package insert generally is regarded as the "label" for a pharmaceutical product.
[0753]
"Concurrent administration," "administered in combination," "simultaneous administration," and similar phrases mean that two or more agents are administered concurrently to the subject being treated. By "concurrently," it is meant that each agent is administered either simultaneously or sequentially in any order at different points in time. However, if not administered simultaneously, it is meant that they are administered to an individual in a sequence and sufficiently close in time so as to provide the desired
therapeutic effect and can act in concert. For example, a Compound of the Disclosure can be administered at the same time or sequentially in any order at different points in time as a second therapeutic agent. Cpd. No. 129
[0886]
To a round-bottom flask, \(\mathrm{N}, \mathrm{N}\)-diisopropylethylamine ( 50 mg ) was added to a solution of 3-(4-amino-1-oxoisoindolin-2-yl)piperidine-2,6-dione (20 mg), HATU ( 30 mg ), and 2,2-dimethyl-4-oxo-3,8,11,14-tetraoxa-5-azaheptadecan-17-oic acid (50
mg ) in DMF ( 1 mL ) at room temperature. The mixture was stirred for 30 min and the solvent was evaporated as much as possible and the residue was poured into water. After extraction with ethyl acetate for three times, the combined organic layer was washed with brine and dried over anhydrous \(\mathrm{Na}_{2} \mathrm{SO}_{4}\). After filtration and evaporation, the crude residue was dissolved in 3 mL of DCM and TFA (2:1). After stirring for 1 h , the solvent was evaporated to give the crude product which was purified by flash column chromatography to yield Cpd. No. 129. ESI-MS calculated for \(\mathrm{C}_{22} \mathrm{H}_{31} \mathrm{~N}_{4} \mathrm{O}_{7}[\mathrm{M}+\mathrm{H}]^{+}=\) 463.2; Observed: 463.4 .

Step 1: Synthesis of tert-butyl (4-oxobutyl)carbamate
To solution of tert-butyl 4-hydroxybutyl)carbamate ( \(380 \mathrm{mg}, 2 \mathrm{mmol}\) ) in 15 ml of DCM was added Dess-Martin periodinane reagent ( \(1.7 \mathrm{~g}, 4 \mathrm{mmol}\) ). After stirring at room temperature for 1 h the reaction mixture was filtered by celite. The filtrate was then washed with brine, dried over \(\mathrm{Na}_{2} \mathrm{SO}_{4}\), filtered, and the solvent evaporated in vacuo. The residue was purified by chromatography over silica gel, to yield tert-butyl (4-oxobutyl)carbamate as colorless oil.
[0889] Step 2: Synthesis of 3-(4-((4-aminobutyl)amino)-1-oxoisoindolin-2-yl)piperidine-2,6-dione (Cpd. No. 131)
[0890] To tert-butyl (4-oxobutyl)carbamate ( \(190 \mathrm{mg}, 1 \mathrm{mmol}\) ) in 1,2-dichloroethane \((15 \mathrm{~mL})\) was added Lenalidomide ( \(285 \mathrm{mg}, 1.1 \mathrm{mmol}\) ), and the resulting solution was
stirred at room temperature for 30 min . The solution was treated with \(\mathrm{Na}(\mathrm{OAc})_{3} \mathrm{BH}\) ( \(0.42 \mathrm{~g}, 2 \mathrm{mmol}\) ), and the resulting suspension was stirred overnight. The solvent was diluted with DCM and washed with sat. \(\mathrm{NaHCO}_{3}\), brine, dried \(\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)\), filtered, and concentrated. Then residue was diluted in 10 mL DCM then 2 mL trifluoroacetic acid was added to the reaction and stirred for 30 min . The solvent was removed by vacuo and the residue was purified by reverse phase chromatography over C18 column to yield Cpd. No. 131 as colorless oil.
[0891] Step 3: Synthesis of Cpd. No. 19
[0892] HATU ( \(13.3 \mathrm{mg}, 1.2\) eq.) and \(\mathrm{N}, \mathrm{N}\)-Diisopropylethylamine ( 0.026 mL , 0.15 mmol ) were added to a solution of Cpd. A ( \(20 \mathrm{mg}, 0.029 \mathrm{mmol}\) ) in 0.5 mL DMF and stirred. After 10 minutes, Cpd. No. 131 ( \(0.35 \mathrm{~mL}, 0.1 \mathrm{M}\) in DMSO) was added to the reaction. After 30 minutes, the solvent was removed and the crude was dissolved in 3:1 methanol/water, acidified with trifluoroacetic acid and purified by reverse-phase preparative HPLC. The purified fractions were combined, concentrated in vacuo, redissolved in \(\mathrm{H}_{2} \mathrm{O}\), frozen and lyophilized to give Cpd. No. 19 (TFA salt) as a white powder.

In vitro activity
[1060] Cell growth inhibitory activity of representative MDM2 protein degraders was determined using CellTiter-Glo® Luminescent Cell Viability Assay. Cells were seeded in 384-well white opaque cell culture plates at a density of 2,000 cells/well with serially diluted compounds and incubated at \(37^{\circ} \mathrm{C}\) in an atmosphere of \(95 \%\) air and \(5 \% \mathrm{CO}_{2}\) for 4 days. Cell viability was determined using the CellTiter-Glo \({ }^{\circledR}\) Luminescent Cell Viability Assay Kit (Promega, Madison, WI) according to the manufacture's instruction. Briefly, a volume of CellTiter-Glo® Reagent equal to the volume of cell culture medium was added to each well, and then the plates were incubated at room temperature for 10-20 minutes. The luminescent signal was measured using a Tecan Infinite M1000 multimode microplate reader (Tecan, Morrisville, NC). The half maximal inhibitory concentration ( \(\mathrm{IC}_{50}\) ) was calculated using the GraphPad Prism 5 software (GraphPad Software, La Jolla, CA). Cpd. A (a MDM2 inhibitor; see Compound Example No. 22 of US \(8,629,141\) ) has an \(\mathrm{IC}_{50}\) of \(0.086 \mu \mathrm{M}\) in the \(\mathrm{RS} 4 ; 11\) cell line and an \(\mathrm{IC}_{50}\) of \(0.100 \mu \mathrm{M}\) in the MV4-11 cell line. The structure of Cpd. A is:

treatment with Cpd. No. 15 and Cpd. No. 22 as compared to Cpd. A, indicating MDM2 degradation.

\section*{EXAMPLE 24}

Activation of p 53 downstream target genes by the MDM2 degraders RS4;11 cells were treated with Cpd. A ( \(0.3 \mu \mathrm{M}\) ), Cpd. No. 15 ( 10 nM ), and Cpd. No. \(22(10 \mathrm{nM})\) for 3,6 , or 12 hours, and then harvested and washed. Cellular mRNA samples were extracted from the cells and then subjected to Reverse Transcription and quantitative real-time PCR for the analysis of the mRNA levels of three representative p53 target genes: 221 , that induces cell cycle arrest, and PUMA and BAX that leads to apoptosis. Significant activation of these p53 downstream target genes was detected with Cpd. A, Cpd. No. 15, and Cpd. No. 22. See Fig. 3, Fig. 4, and Fig. 5.

\section*{EXAMPLE 25}

MDM2 degradation by Compounds of the Disclosure
[1064] RS4;11 cells were pre-incubated with the proteasome inhibitor MG-132 ( \(20 \mu \mathrm{M}\) ) or without any pre-incubation for 2 hours. Next, the cells were treated with Cpd. A \((0.3 \mu \mathrm{M})\), Cpd. No. \(14(0.03 \mu \mathrm{M})\), Cpd. No. \(15(0.01 \mu \mathrm{M})\), and Cpd. No. \(22(0.01 \mu \mathrm{M})\) for 2 hours, then harvested and lysed. The cell lysates were subject to western blotting analysis. See Fig. 6. In the absence of pre-incubation with MG-132, the protein level of MDM2 was significantly decreased after treatment with the Compounds of the Disclosure as compared to Cpd. A. However, in the presence of MG-132, no significant MDM2 degradation was detected with the Compounds of the Disclosure, indicating that the degradation of MDM2 by the Compounds of the Disclosure is proteasome dependent.

Significant rightward shifts of the dose response curves were observed with Cpd .

\section*{EXAMPLE 27}

MDM2 degradation by Compounds of the Disclosure is cereblon (CRBN)-dependent
[1066]
RS4;11 cells were pre-incubated with \(30 \mu \mathrm{M} \mathrm{Cpd}\). C to compete for the binding of phthalimide to CRBN, or DMSO, for 2 hours before adding Cpd. A, Cpd. No. 14, Cpd. No. 15, and Cpd. No. 22. In the Western blot RS4;11 cells were then co-treated with the indicated compounds at the indicated concentrations after pre-incubation. See Fig. 7. These data suggest that both MDM2 degradation and p 53 activation by Cpd . No. 14, Cpd. No. 15 , and Cpd. No. 22 were significantly competed by Cpd. C, indicating that they are CRBN binding-dependent.

\section*{EXAMPLE 28}

Cell growth inhibitory activity of Compounds of the Disclosure is p53-dependent.
[1067]
RS4;11 cells with stable shRNA knockdown of p53 or those transfected shRNA control vector were treated with Cpd. A, Cpd. B, Cpd. No. 14, Cpd. No. 21, Cpd. No. 15, and Cpd. No. 22 for 4 days, with a cell concentration of \(\sim 15,000 /\) well. Cell growth inhibition was determined by WST assay. See Table 7 (p53) and Table 8 (control). Significant increases in \(\mathrm{IC}_{50}\) of the Compounds of the Disclosure in the p53 knockdown RS4;11 cells were observed compared with that in the sh control cells. These result show that activities of the Compounds of the Disclosure are largely p53-dependent. The p53 knockdown efficiency was determined by western blot for p53 protein levels with or without treatment of Cpd. A ( \(1 \mu \mathrm{M})\) for 2 hours. See Fig. 8 .

Continuation of Box II. 2
Claims Nos.: 1, 41, 42, 44, 46-70, 72-78, 83-92, 94, 95, 97-121(all partially)

The present claims \(1,41,42,44,46-70,72-78,83-92,94,95,97-121\) of invention 1 relate to an extremely large number of possible compounds, pharmaceutical compositions and uses thereof, due to the fact that formula L 1 and B-1a of claim 1 accordingly contains so many options, variables and possible permutations. Support and disclosure within the meaning of Article 6 PCT and Article 5 PCT are to be found, however, for only a very small proportion of the compounds claimed, see especially the examples.
Non-compliance with the substantive provisions is such that a meaningful search of the whole claimed subject-matter of invention 1 could not be carried out.
It is furthermore stressed that, the initial phase of the search of invention 1 revealed a very large number of documents relevant to the issue of novelty. So many documents were retrieved that it is impossible to determine which parts of claim 1 according to invention 1 may be said to define subject-matter for which protection might legitimately be sought. For these reasons, a meaningful search of the whole claimed subject-matter of invention 1 could not be carried out. The extent of the search was consequently restricted to those claimed compounds, which appear to be supported and to a generalisation of their structural formulae, namely compounds wherein: L 1 means X1 -L2 -Y1 with X1 is X2 meaning \(N(H), 0\) or CH2 ; R5 is hydrogen and A1 to A3 mean a carbon atom.

The applicant's attention is drawn to the fact that claims relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure. If the application proceeds into the regional phase before the EPO, the applicant is reminded that a search may be carried out during examination before the EPO (see EPO Guidelines C-IV, 7.2), should the problems which led to the Article 17(2) declaration be overcome.
