		11. Contract or Grant No. DOT-HS-031-1-037	
		13. Type of Report and Period Covered Final Report February 1971 through October 1972	
12. Sponsoring Agency Name and Address National Highway Traffic Safety Administration Department of Transportation Washington, D.C. 20590		14. Sponsoring Agency Code	
15. Supplementary Notes			
16. Abstract This is Volume 2 of a 5 volume final report describing the results of the Multidisciplinary Accident Investigation (MDAI) Report Automation project. It describes by example analysis of the MDAI data files and provides a team by team comparison and several cross indexes to the team reports.			
In particular, the strengths and limitations of the MDAI data in identifying traffic accident and injury problems is discussed. A three hour analysis study is documented to exemplify an approach to the data. The various accident investigation teams are then compared in terms of date of accident, program matrix cell comments, average severity of injury and vehicle damage, occupant age and sex, and other variables. Descriptive statistics of trip origin and destination are also provided. The appendices cross index each case report by team case number, DOT-HS Number, case vehicle injury severity and case vehicle damage index.			
17. Key Words Multidisciplinary Accident Investigation Reports, Computer Automation of Accident Reports, Accident Data Analysis, Accident Descriptive Statistics, Timeshared		18. Distribution Statement Unlimited

SECTION 1 INTRODUCTION

The digital file of NHTSA-sponsored Multi-Disciplinary Accident Investigations has been combined with an on-going file of in-depth investigations sponsored by the Motor Vehicle Manufacturers Association, and is currently actively available for analysis on the University of Michigan's time-sharing computer system. The combined data represent an exceedingly detailed set of information about some 2500 vehicles and their 4000 occupants--detailed with respect to the accident conditions, the vehicle damage, the injuries sustained, and for the NHTSA-sponsored cases, several driver social and psychological descriptors.

The working files--i.e., those available to users through the computer--are arranged in three forms. The first file contains one case for each vehicle for which a CPIR form was completed. The second file contains one case for each occupant, with the relevant vehicle information being repeated in the cases of multiple occupancy. The third file contains one case for each injury sustained, with the relevant occupant and vehicle information being repeated as necessary. Thus it is possible to address the data with such questions as: What are the differential patterns of occupant contact injuries in rear-end collisions as a function of the size of the passenger car? or, What is the distribution of type of pelvic injury as a function of occupant age?

There are some obvious problems in drawing inferences from queries of this sort. The data in combined form were not collected in response to a clearly defined plan, and thus are not likely to be representative of the nation as a whole. Further, although investigators more recently have been trained together and reporting practices have been standardized to a large extent, many of the earlier case reports were not as well controlled. Although there has been some effort in the editing to account for these differences, it is clear that this editing did not resolve all such problems.

Under a separate contract program extensive analyses of the data are being conducted with the intent of defining the strengths and limitations of the multi-disciplinary data from a statistical point of view. At the time of this writing any final judgment on that subject is premature. Nevertheless, some preliminary results of ongoing analyses will be presented here, with appropriate cautions, in order to reveal to the reader the structure and contents of the present file.

The automation of the MDAI reports has opened a Pandora's Box, i.e., the whole MDAI reporting system is opened to critique as the data is now more available. Frequently the newly exposed data file user is initially impressed with the depth of the file, only to discover that the specific question he is interested in is not recorded or, even worse, is recorded but filled with "unknown" codes. The discovery of criticisms is one of the types of feedback required to adapt and evolve the MDAI program towards best meeting the needs of highway safety administrative staff.

Users of the CPIR data files generally come to realize that there are several links along the accident investigation reporting chain that can fail in any specific incident. First are the failures in the quality and thoroughness of the MDAI team investigation and documentation. Thru various team training activities, the NHTSA Accident Investigation Division has made great strides in improving the quality and standarization of team documentation. The editing guidelines documented in Volume 5 Sections 2-4, are intended to help standardize interpretation among the investigators. Second are the inadequacies in the basic reference information provided the teams and the HSRI data editors. Even if a field investigator accurately measures the angle of a displaced steering column an "unknown" Column Vertical Rotation is recorded if the team had not been supplied with the original column angle from which they could compute the amount of rotation. Volume 5 Section 5, Reference Information is intended to alleviate this problem.

Third are the incompleteness and ambiguities in the currently computerized data reporting forms. While solution of this problem was outside the domain of this contract, necessary forms revision is strongly urged. The documentation of the existing scheme in the other volumes of this report does not constitute a recommendation that this is the way the system should be continued. The fourth, and final link is the data editing and processing of data into computer files. The quality control procedures taken in the step are fully discussed in the first volume. Generally every effort is made to fill in "unknowns" from team case documentation and photographs or to supply basic reference information that might not have been available to the teams. Corrections and file revisions are made as necessary.

The comments above may seem rather negative about the value of the present data. There are certainly some positive features:

- (1) The data represent many parts of the country, a feature which results from NHTSA's intentional sponsorship of teams in widely scattered geographical locations.
- (2) The data represent many (or perhaps most) kinds of highway traffic accidents, although not necessarily in proportion to their occurrence in the general population.
- (3) The accuracy of reporting is relatively good, in part because the information has been collected by dedicated professionals, and in part because the redundancy in the reports has permitted consistency checking in editing.
- (4) The detail available in this data exceeds that of most recorded phenomena. This was accomplished with the intent that an unrestricted data set with fine detail would permit later test of many hypotheses. While some uses for the data were pre-conceived (e.g., identification of injury sources within passenger compartments) other uses (such as defining the distribution of impact direction in urban intersection collisions) are conjured up frequently.

SECTION 2 DATA ANALYSIS AND DISPLAY APPLICATION TECHNIQUES

Each of the three data sets defined above may be thought of in terms of a Venn diagram such that any definable subset (e.g., 1969 full size Fords with female drivers more than 30 years of age) may be selected for analysis. Following that selection, a variety of descriptive or inferential statistical techniques may be employed to analyze the data. For example, given the above subset it is easy to display the average weight of those drivers for each day of the week; or to display a two-way tabulation of type of injury (fracture, laceration, contusion, etc.) by location of that injury (head, neck, shoulder, etc.).

One of the most frequent uses of the present set of data is like a library subject index from which a number of case reports can be retrieved concerning a single defined topic of interest. An analyst may wish to study all reported cases in which there had been an engine fire, or in which a rear view mirror was a likely source of injury. A convenient output form for this sort of study is the "casewriter" displayed in Figure 1. This single page contains information from 75 of the variables in the file arranged in a summary form on a sheet which can serve as a notebook page for further study of the problem.

When the computer files do not contain sufficient detail they still can be useful in identifying cases of interest for further study. At times the analyst may wish to conduct a clinical study, of say rib fractures in side collisions, for which the computer data file does not tell which ribs were fractured. Frequently the desired information has been documented in the text of clinical accident studies and the computer can be used to subset for the analysts just the cases of potential interest.

Instructions for the use of the various retrieval and analysis computer programs are given in Volume 3 of this report, along with samples of the printed output. The following is a sample list of topics recently explored in the CPIR data files.

Sample Listing of CPIR File Topics

- Seat Belt Effectiveness
- Restraint System Requirements for Second Seat Occupants
- Incidence of Windshield Popouts
- Ejection vs. Injury Severity
- Inches of Front Crush vs. Impact Speed
- Incidence of Concussion Resulting from Windshield Contact
- Injury Severity and Roof Crush for Front Seat Occupants
- Small Car vs. Big Car
- Team-by-Team Comparisons
- Incidence of Fire
- Rollover Accident Characteristics
- Child Injury Patterns
- Frequency of Occupants Out of Normal Seated Positions
- Incidence of Vehicle Malfunctions

A SAMPLE ANALYSIS

The novice often looks at large banks of data with the expectation that they are able to answer longstanding and difficult questions with ease. It would be so nice if we could address the set of CPIR data with the question: "Is standard 208 effective in reducing injuries?", and get back a simple yes or no--or better yet some benefit to cost ratio which could be used to support the choices we have made.

It should be evident to everyone but the novice, however, that the store of data from these (or any other set of) accidents has been prepared simply to permit the investigator to shorten the computation and search time in pursuit of an answer. There is still no substitute for analyzing a problem, modeling it, and defining carefully the data analysis needed to solve (or help to solve) it.

Keeping in mind the limitations of the data discussed above, an example of the analytical procedures which can be used in a particular problem is given here. One might be concerned with the requirements for occupant protection as a function of age - for example, if older people suffer greater injury in the same impact severity, and if their injuries are of a different type (say more fractures) it may be desirable to make specialized restraints available to occupants of different age groups. Certainly this has been considered for infants and small children, but should it also be considered, for say, car occupants over 40 years of age?

A comparison of the mean injury for each level of vehicle damage (from the VDI-extent code) and for each of the four age groups provides the plot of Figure 2. For all VDI levels the injury to 60-80 year old persons is noticeably higher than for younger persons. Data for this plot was obtained in a few minutes using a packaged analysis of variance program described in Volume 3 of this report. While it indicates a difference in injury severity, it does not help much in explaining the type or location of the more severe injuries.

A second pass at the data results in four tables shown in Tables 1-4. Each of these counts the total number of injuries for each cell, and in general has more entries than the number of occupants--i.e., there are several recorded injuries per occupant. These have been divided into the same four age classes as shown on Figure 2.

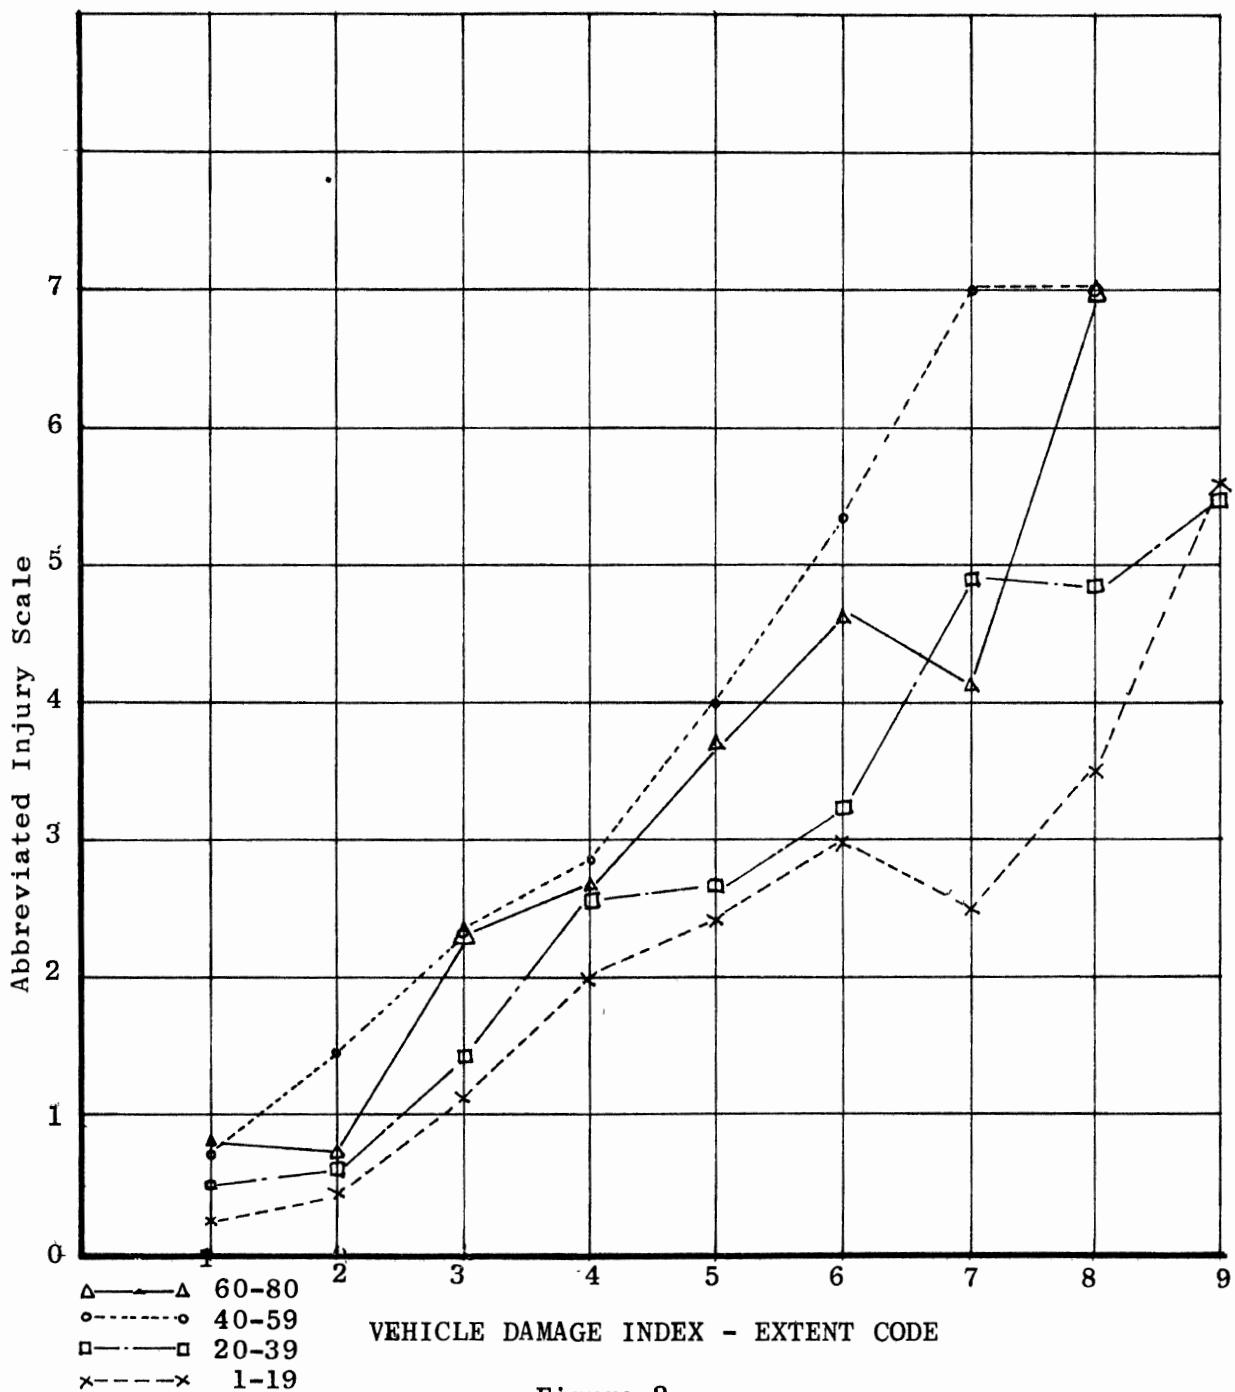

Figure 2

Average injury (AIS) vs. VDI for four different age groups
 60 to 80 year olds, 40 to 59 year olds, 20 to 39 year olds,
 and 1 to 19 year olds. Data taken from CPIR file as of
 October 1972.

Table 5 is a comparison of the marginals of these four displays for injury type. The cells with the most significant contribution to the chi-square (which is quite significant for the whole table as indicated) are circled, indicating that occupants older than 40 years of age are overrepresented in "fractures", "hemorrhage", and under-represented in "complaint of pain". Table 6 shows the marginal distributions for body region, and indicates that older persons are over-represented in thorax injuries--again the split coming at about age 40.

Young people, on the other hand, are much underinvolved in thorax injuries.

There are many questions left unanswered by this presentation. It may be that older persons incur chest injuries primarily because they are drivers; or perhaps older persons are more likely to be in frontal impacts than are younger persons. It is still not clear (from the analysis presented here) that the thorax injuries and the fractures are highly correlated, although one would suspect that this is true. Finally, it will probably be quite useful to our understanding of this phenomena to list out the numbers of the cases in which severe chest injury is incurred by older people, perhaps along with accidents of similar configuration and severity involving younger occupants, and to compare the investigator's observations and photographs.

This short investigation was conducted over a period of about three hours, and falls far short of any final answer to the original hypothesis. But it is intended to indicate that this set of data coupled with facile analysis techniques can be used to gain insight into phenomena associated with traffic accidents, and to provide one input to the definition, understanding or solution of a problem.

SECTION 3 DESCRIPTIVE STATISTICS

The digital file of in-depth clinical case studies has been constructed to include information on about 800 variables for each case. The data input derived from accidents reported (generally) on the Collision Performance and Injury Report, Revision 3, with additional data elements stemming from reading of the textual material accompanying these reports.

While this report is concerned primarily with those reports furnished by NHTSA-sponsored accident investigation teams, data from investigations sponsored by the Motor Vehicle Manufacturer's Association has been included. The reports generally known as "Cornell III-A" investigations have resulted from a jointly sponsored program (MVMA-NHTSA), whereas the Oakland County, Michigan (Huelke), and Washtenaw County "Level II" cases have been sponsored solely by MVMA. As they are all recorded in the same file structure information is presented for these latter teams for those variables for which it is available.

This document is intended to present some descriptive statistics for this file. We note at the outset that the data file does not represent all of the cases which have been investigated to date for any of several reasons. Emphasis on inputting data has been on the more recently completed cases, and some published cases which are several years old have not found their way up the queue as yet. Some cases which have been submitted have not been forwarded for coding by the sponsor. Finally only those cases involving passenger automobiles (and small vans or pickup trucks) have been included in the present file since it is tailored for only these vehicles. Large trucks, school buses, etc. then are specifically omitted.

The various accident investigation teams have operated under different collection rules from time to time during the past three years. As a result the entire collection of data must be viewed as being unrepresentative of the national accident picture. The severity of accidents in this set is greater than the national average and the vehicles investigated are newer. The drawing of inferences from this data to the national situation is beyond the scope of the present contract. Consequently the data presented here has two purposes: (1) to provide for the general reader a picture of the characteristics of accidents investigated and (2) to provide for the participants (i.e., the investigative teams themselves) a picture of the variety of investigation among teams.

The following tabulations are divided into five groups as follows:

- (1) Histograms of the number of vehicles investigated by month of investigation and by team, including a grand total by month over a $3\frac{1}{2}$ year period.
- (2) Average number of matrix cell entries by team and by matrix cell.

- (3) A set of means and standard deviations arranged in increasing order by team for:
 - (a) overall occupant injury severity (AIS)
 - (b) overall driver injury severity (AIS)
 - (c) occupant age
 - (d) driver age
 - (e) occupant sex (i.e., percent female occupants)
 - (f) driver sex (i.e., percent female drivers)
 - (g) Percent rural (vs. urban) accident location
 - (h) total number of vehicles involved in accident
 - (i) maximum injury severity (AIS) in vehicle
 - (j) vehicle damage index (extent code)
 - (k) number of occupants in the vehicle
 - (l) vehicle speed (mph) prior to collision
 - (m) vehicle speed (mph) at impact
 - (n) number of slides submitted with case
- (4) Tabulations for the entire set of data for distribution of:
 - (a) Manufacturer
 - (b) Model year of vehicle
 - (c) Vehicle weight
 - (d) Type of collision
 - (e) Vehicle damage index (clock)
 - (f) Light condition at time of collision-by team
- (5) Origin and destination of trip in which the accident occurred for the entire set of data and by teams.

The one-way distribution for all variables in the working file of the MDAI data are published separately in Volume IV, and reference may be made to this document for further detail.

DISTRIBUTION OF RECORDED CASES BY MONTH AND TEAM

Figures 3 and 4 show the distribution of reported cases in the present file by month and year of occurrence of the accident. As mentioned above, there are many cases which have been completed which are not incorporated in the present file, so that this should be viewed generally as a picture of the file contents rather than individual team performance. The final histogram contains the sum of the individual team data. Cases in which the date of collision was not documented were not included, thus the UCLA Trauma Research Group cases are not displayed.

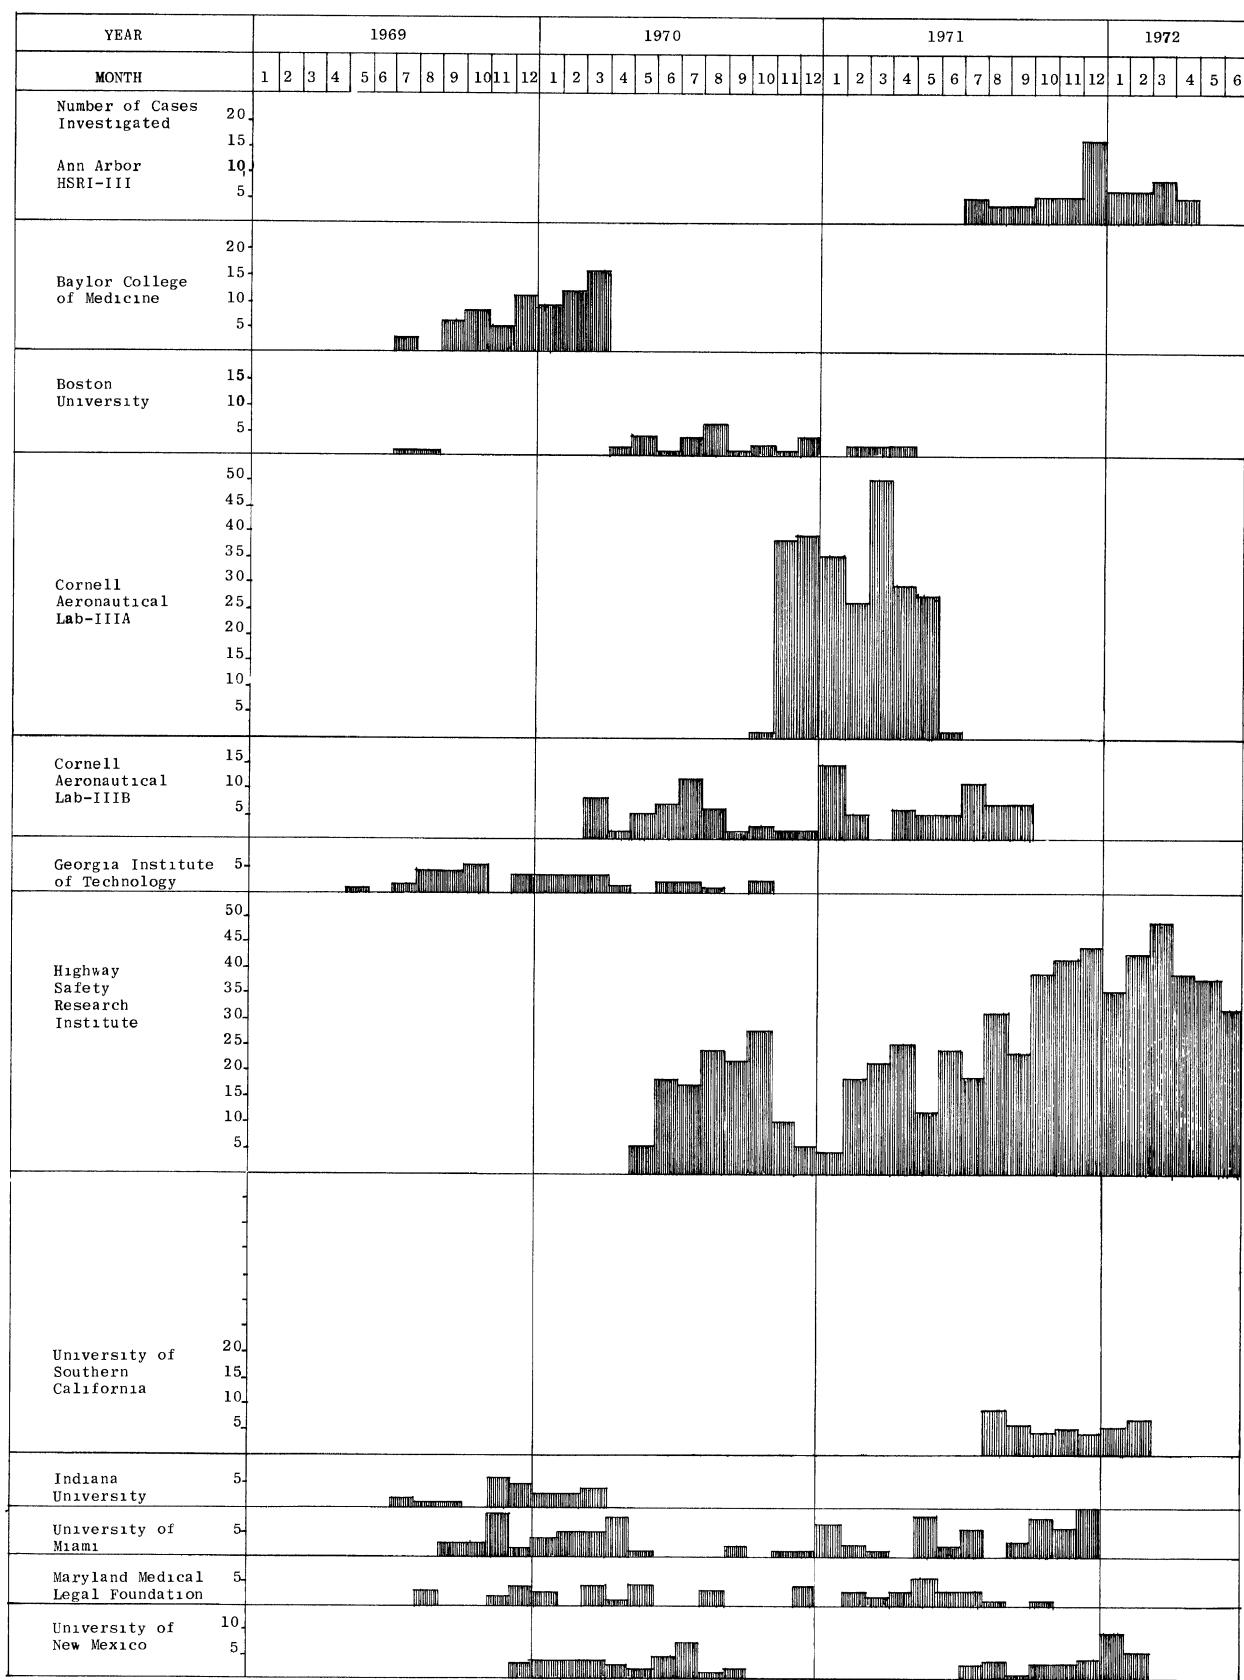

FIGURE 3
DATE OF ACCIDENT

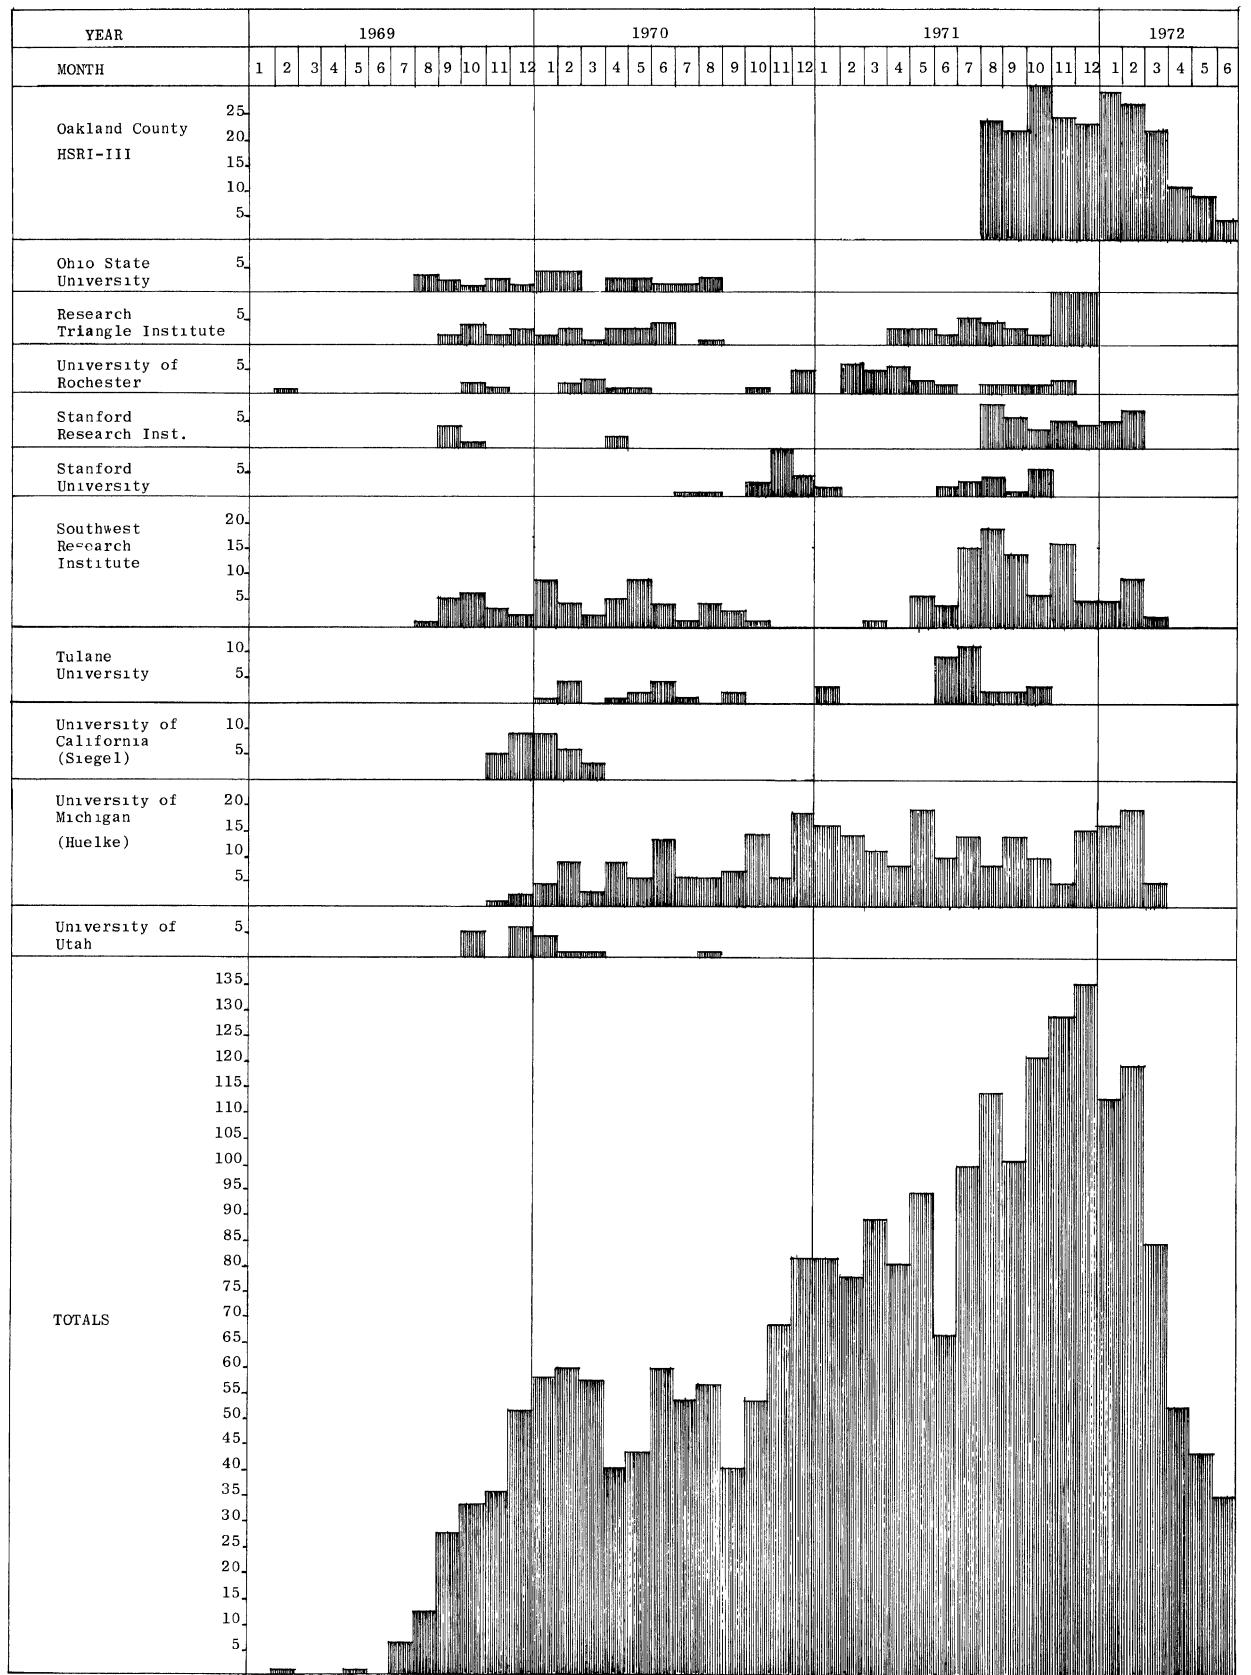

FIGURE 4
DATE OF ACCIDENT

PROGRAM MATRIX CELL ENTRY COUNTS

Table 7 displays the mean number of comments in each of the nine matrix cells by team as reported under "Causal Factors, Conclusions, Recommendations". The averages for all MDAI teams taken together are shown in Table 8 and Figure 5. Note that there are no entries in Table 7 for the MVMA-sponsored team as they do not record this item of information.

Table 8

Average number of matrix cell entries
across all MDAI team reports by cell.
(Standard deviation of the means given in parentheses)

	<u>Human</u>	<u>Vehicle</u>	<u>Environment</u>
Pre-Crash	2.694 (.805)	.565 (.359)	.982 (.366)
Crash	1.045 (.462)	1.638 (1.285)	.262 (.200)
Post-Crash	.465 (.488)	.188 (.143)	.421 (.311)

It should be noted that these matrix cell entries can be either positive or negative comments about the circumstances of the accident. For example the item "Driver had been trained in a professional driving school to maneuver in skidding situations, and this experience contributed to the lessened severity of the accident" would be a positive comment in the "pre-crash human" cell. The comment "open guard rail end impaled the vehicle side and contributed to increased injury" would be a negative comment under the "environment crash" cell. In this particular display there is no differentiation of positive and negative comments, and thus it cannot represent factors so much as it does the team's reporting practices. It also depends, of course, on the types of accidents reported by each team--Baylor and SRI-1 for example concentrated on defective vehicle crashes as indicated by their high average in the vehicle pre-crash cell.

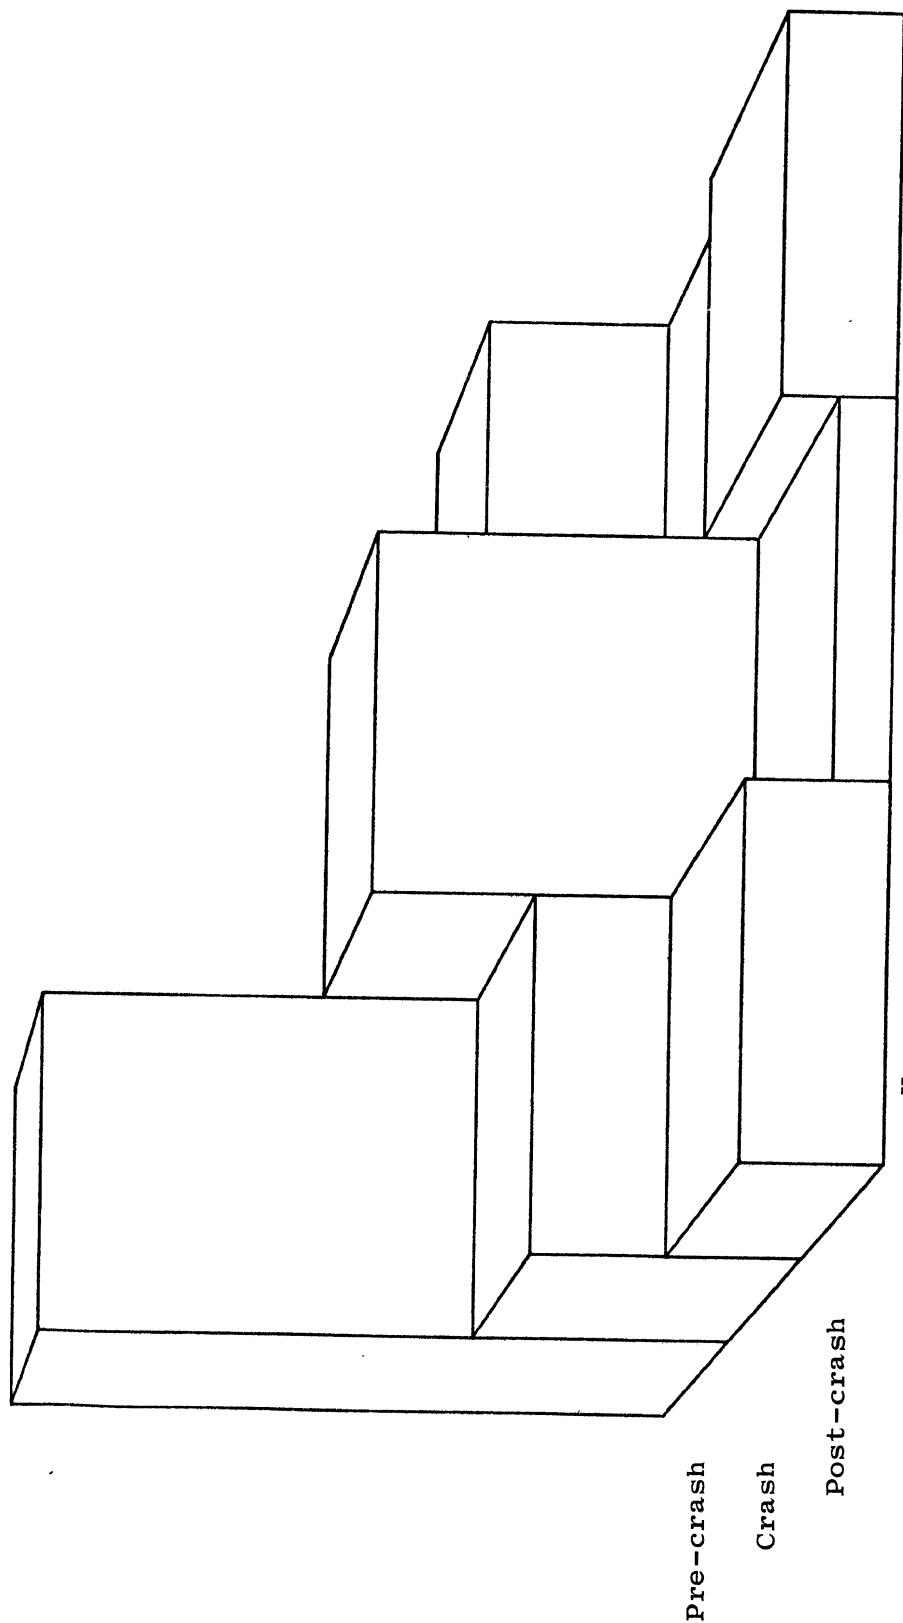

In Table 8 the standard deviation of the means is much smaller for the mean for three cells--human pre-crash, human crash, and environment pre-crash--indicating that these items are rather consistently reported by all teams. The other cells then show less consistency. A correlation test between Miami and Maryland yields a coefficient of $r=.828$, indicating that these two teams report similarly across the cells, although the average number of entries is somewhat higher for Miami. The same test between New Mexico and Baylor yields $r=.528$, indicating low correlation of reporting practices between these teams.

PROGRAM MATRIX CELLS

FIGURE 5

TABLES OF MEANS FOR EACH TEAM

Each of the tables of mean values of variables by team is given in two orders--first by increasing value of the mean, and second by increasing value of the standard deviation.

Tables 9, 10, 11, 12, 13 and 14 present a mean value of the injury extent code based on the abbreviated injury scale (AIS). This is the scale used in reporting injury severity in the Collision Performance and Injury Report form, and is an ordered scale ranging from value zero for uninjured to 9 for the most severe fatal case. The precise meaning of the average value of this variable is unclear, but it serves to characterize the several teams in terms of the general severity of injury covered in their case studies.

Occupant age is given in years in Tables 15 through 18, and those few occupants whose age has been coded in months (generally less than 2 years of age) have not been included in the averages.

The percent of female occupants and drivers in Tables 19 through 22 is self-explanatory, although reasons for the variation may not be so easily explained. Interpretation is left to the reader. The same applies to percent rural accidents in Table 23 and 24.

Tables 25 and 26 present the average number of vehicles involved in the reported accidents, but this is unfortunately weighted by the number of CPIR reports. Thus a team which has reported on a CPIR form for two passenger cars which have struck each other will have that two-car accident reported twice, whereas a team which has reported a car-bus accident will have it reported only once in this tabulation. Single vehicle accidents will, of course, be counted only once in any case. The ordering of the means may be taken as being reasonably correct, but the exact value will depend somewhat on the factors mentioned above.

The vehicle damage extent in Tables 27 and 28 is based on the last digit of the Vehicle Damage Index code, ranging from 0 (for undamaged) to 9 for maximum damage.

Tables 29 and 30 (number of occupants per vehicle) and Tables 31 through 34 (vehicle speeds) are self-explanatory. Tables 35 and 36 display one of a number of "administrative" variables maintained in the master file of data. The number of color slides, the number of autopsy photographs, the number of black and white photos, etc. are recorded in this file. The number of slides count shown in these tables shows a moderate amount of variation from team to team.

TABLE 36 NUMBER OF SLIDES SUBMITTED WITH CASE, ORDERED BY S. D.

NOTE UCLA-SIEGEL CASES LISTED AS MISSING DATA FOR THIS VARIABLE

SOME ONE WAY DISTRIBUTIONS OF THE ENTIRE SET OF DATA

Summarized information for the entire file is shown in Tables 37 through 42.

Table 37 indicates that the majority of vehicles in the data set are manufactured by General Motors, followed in order by Ford and Chrysler. There is little significant variation among teams except that in three of the MVMA-sponsored teams (Huelke, HSRI, and Cornell III-A) Ford products predominate over General Motors. These inversions are large enough to make the distribution of vehicles in this total file different from the national averages.

Table 37

File Contents by Manufacturer

<u>Manufacturer</u>	<u>N</u>	<u>Percent</u>
General Motors	1041	4.18
Ford	838	33.7
Chrysler	403	16.2
American Motors	70	2.8
Others	137	5.5

Contents of the file by vehicle model year are shown in Table 38. Pre-1965 cars have been grouped in this display. Note that the normal way a pre-65 vehicle is entered in the file is that it has been a second (or third etc) vehicle in a multiple car accident involving at least one newer (less than three year old) car. This indicates that the analyst must use caution in drawing inferences about differences between older and newer vehicles. Although the team by team data has not been displayed, we note that two Texas teams account for 34% of the older (i.e., pre-65) vehicles, with another 22% provided by Miami and New Mexico.

Table 38
File contents by model year of vehicle

<u>Year</u>	<u>N</u>	<u>Percent</u>
Pre-1965	109	4.4
1965	46	1.8
1966	37	1.5
1967	64	2.6
1968	141	5.7
1969	355	14.3
1970	982	39.5
1971	629	25.3
1972	124	5.0

The weight distribution of vehicles in the file is given in Table 39. These vehicles weighing more than 6500 pounds are primarily pickup trucks investigated by HSRI or Huelke.

Table 39
Distribution of Vehicles in File by Weight

<u>Weight</u>	<u>N</u>	<u>Percent</u>
Unknown	54	2.2
Less than 1500 pounds	5	.2
1501-2500 pounds	374	15.0
2501-3500 pounds	1085	43.6
3501-4500 pounds	802	32.2
4501-5500 pounds	92	3.7
5501-6500 pounds	1	0.0
Greater than 6500 pounds	77	3.0

Type of collision for the entire set of data is shown in Table 40. Since this file contains one case per vehicle reported, this table actually represents a count of "reported vehicles by accident type". The practice of reporting all vehicles for MDAI cases came into being about the middle of the reporting period, and there are thus some double counts in this data. The reader should be wary of comparing this distribution with other sources of the same sort of information.

Table 40
Type of Collision for the File Data

<u>Type of Collision</u>	<u>N</u>	<u>Percent</u>
Single vehicle	702	28.2
Head-on	292	11.7
Intersection	947	38.0
Side-swipe	117	4.7
Rear-impact	420	16.9
Other	8	.3

The clock distribution of reported Vehicle Damage Indices for the entire set of data is shown in Table 41. Clock index zero indicates a rollover or other non-horizontal impact force vector. The other indices indicate the primary impact force vector--i.e., that force vector primarily related to the injuries incurred in the vehicle. Team by team variation in this distribution is small, but Boston, Maryland, RTI, and Utah dominate the rollover or "non-horizontal impact" cases.

Table 41
Vehicle Damage Index Distribution

<u>Clock</u>	<u>N</u>	<u>Percent</u>
0	170	6.8
1	321	12.9
2	236	9.5
3	87	3.5
4	33	1.3
5	34	1.4
6	126	5.1
7	40	1.6
8	34	1.4
9	102	4.1
10	208	8.4
11	398	16.0
12	700	28.1

Table 42 shows the distribution of case reports by light condition at the time of the accident. Some of the percentage variations is of doubtful meaning because of small cell size but a few observations are in order. Fatal accidents (Boston and Maryland) predominate at night. UCLA Trauma cases do not appear as time of day was intentionally deleted in the published cases to minimize direct identification of the case.

Table 42
Light condition at time of accident by team.

	<u>Daylight</u>	<u>Darkness</u>	<u>Dusk</u>	<u>Dawn</u>	<u>Total</u>
Ann Arbor	28 (45.2%)	27 (43.5%)	6 (9.7%)	1 (1.6%)	62

Utah	9 (50.0%)	6 (33.3%)	3 (16.7%)	0 (0.0%)	18
TOTAL	1325 (53.2%)	989 (39.7%)	114 (4.6%)	56 (2.2%)	2484

ORIGINS AND DESTINATIONS OF ACCIDENT TRIPS

One item of information usually provided in the multi-disciplinary investigation reports is the origin and destination of the trip during which the accident occurred. While not an item on the report form, this data has been complete enough in the text to permit coding it into the digital file. The possible code levels are (1) unknown, (2) home, (3) work, (4) shopping, (5) recreation, (6) friends or relatives home, (7) bar or wet party, (8) church, (9) school, and (10) other. Both origin and destination are coded using this list.

Table 43 shows the "to" and "from" counts for the present set of data.

Table 43
Origins and Destinations for MDAI Cases

	To	From
Home	410	255
Work	168	212
Friend's	95	149
Shopping	79	74
Other	65	36
Recreation	62	62
School	22	37
Church	5	4
Bar/Wet Party	4	76

The more common types of trips are shown by team in Table 44. Lacking exposure information it is difficult to determine over or underinvolvement except in the more outstanding cases. It is obvious that people get into this file of accident data more frequently when they have just left a bar (or wet party) than when they were going to a party. Churchgoers seem to have little difficulty in either direction, perhaps because there are not many people going to church. And accidents are more frequent for those going home than those going away from home. Note that in the full table only the more frequent trip types have been tabulated.

Table 44
Origin and Destination by Team

APPENDIX A
Team Case Vehicle Index

Each Multi-Disciplinary Accident Investigation case vehicle stored in the computer file is listed here by team case number and includes the primary Vehicle Damage Index (Collision Deformation Classification), the overall case vehicle injury severity (Abbreviated Injury Scale), and the DOT-HS Number.

APPENDIX B
DOT-HS Number Index

Each of the published Multi-Disciplinary Accident Investigation reports in computer storage is listed here by DOT-HS Number. Cases without a known DOT-HS Number are not included.

DOT-HS Number	Team Case Number	Date Submitted

APPENDIX C

Case Vehicle Damage Index/ Abbreviated Injury Scale Index

Each case vehicle investigated by a Multi-Disciplinary Accident Investigation team and processed into computer storage is listed in order by case Vehicle Damage Index (Collision Deformation Classification) and secondarily by case vehicle overall injury severity (Abbreviated Injury Scale).

Primary	Veh	Team Case	Case Computer No.	Vehicle

APPENDIX D

Abbreviated Injury Scale and VDI/CDC Index

Each case vehicle investigated by Multidisciplinary Accident Investigation teams processed into computer storage is listed in order by case vehicle overall injury severity (Abbreviated Injury Scale) and secondly by case Vehicle Damage Index (Collision Deformation Classification).
