

Title: Housing and Eye and Vision Outcomes: A Scoping Review Protocol

Authors: Patrice M. Hicks PhD MPH, Kishan Avaiya BS, Sofia E. Parellada MS, Khawla M. Elnour BS, Mikhayla L. Armstrong BS, Tiffani R. Spaulding MD MPH, Kate M. Saylor MSI, Maria A. Woodward MD MS, Angela R. Elam MD MPH, Roshanak Mehdipanah PhD MS, and Paula Anne Newman-Casey MD MS

Introduction:

Housing plays a significant role in the development and persistence of health disparities over time. Over the past two decades, rental prices have more than doubled, leading to unprecedented financial strains on individuals and families.¹ By 2020, half of low-income renters allocated over 50% of their income towards rent payments.² Of the five Social Determinants of Health (SDoH) as defined by Healthy People 2030, the Neighborhood and Built Environment domain comprises several risk factors, including pollution, transportation, and housing, which can lead to adverse effects on eye and vision health. Research has provided insight into outcomes for populations that experience housing disparities such as significant health disparities across housing-relevant outcomes. Low-income and racial/ethnic minority neighborhoods predominantly have been disproportionately zoned for undesirable uses and expose residents to hazards like air and noise pollution, traffic, lack of green space, and undesirable amenities.³

While the role of housing as a social determinant of health has been extensively studied, a majority of the research has focused on the quality and safety of housing. However, it is clear that poor housing conditions, such as crowding and mold, correlate with multiple adverse health outcomes, such as the development of asthma, hypertension, cancer, anxiety, and depression.⁴⁻⁶ Additionally, research has shown that increases in rent burden and evictions were associated with elevated rates of mortality.⁷ The three pillars that connect these health outcomes to housing include housing cost, conditions, and consistency. Table 1 describes the three dimensions associated with housing, their meanings⁸, and examples.

Table 1. The Three Pillars of Housing

Pillar	Meaning	Example (s)
Cost	“Housing affordability”	Able to pay for housing without difficulty
Conditions	“Housing quality”	Sustainability of unit’s infrastructure and environmental quality
Consistency	“Residential stability”	Rental agreement or housing policy, Eviction protection

In this scoping review, we sought to understand if and which of the three pillars of housing (cost, conditions, and consistency) impact vision health and eye care. Housing conditions have been linked to eye health and vision outcomes. Understanding these

dynamics is essential to properly assess a patient's social needs, which in turn can inform access to eye care and address vision needs.

Inclusion Criteria:

- Studies that include only adults 18 years of age and older.
- Studies published in peer-reviewed journals.
- Qualitative, quantitative, or mixed-methods studies that evaluated housing in eye care and vision health.
- Exclusion criteria: articles that are reviews, abstracts, case reports, or opinion pieces. We exclusively looked at articles written in English, as we were not able to provide translations of these articles.

Types of participants:

- Adults that are 18 years and older

Concept:

The concept of interest for this scoping review is to understand whether and which of the three pillars of housing (cost, consistency, and conditions) impact vision health and eye care.

Context:

The context of the scoping review will be broad; evidence from the literature pertaining to understanding the impact of housing pillars on eye care and vision health within any contextual setting will be included. The evidence will be limited to that published in English.

Types of evidence sources:

We will include the following study designs to obtain evidence for this scoping review: primary research reports of any study design (qualitative, quantitative, and mixed methods studies). The following will be excluded: dissertations that are not yet published, literature reviews, abstracts, editorials, opinion pieces, and book chapters.

Methods:

The methodology for this scoping review will follow the frameworks proposed by Arksey, O'Malley⁹, Levac, and colleagues¹⁰ using the methods outlined in the JBI Manual for Evidence Synthesis. The scoping review team followed a multi-step, iterative process for developing and refining the search strategy.

Search Strategy

Description of strategy: The review team met with an informationist (KMS) in May 2023 to identify the scoping review's target outcomes. The informationist created a relevant search strategy that was utilized in a selection of potential databases to obtain evidence, search terms, and concepts. The scoping review search strategy identified evidence from primary research articles, including quantitative, qualitative, and mixed methods studies. The databases selected for this scoping review were as follows: Ovid MEDLINE, Embase (ELSEVIER), CINAHL Complete (EBSCO), PsycInfo (EBSCO), Web of Science (SCI-EXPANDED, SSCI, and ESCI), and Scopus (ELSEVIER).

After the team's initial search strategies in PubMed were analyzed and refined, it was determined that Ovid MEDLINE would be the primary database for searching MEDLINE. As the searches were translated across the remaining databases, the review team reviewed search terms and results for each database and provided feedback on the search terms.

The scoping review's final search strategy centers around the main concept of identifying the three housing pillars and associated factors related to vision health and eye care. Publications that were excluded from the review included no primary literature (reviews, abstracts, commentary, unpublished dissertations, and book chapters). The final search was run in May 2023 using EndNote 20 (Clarivate) to manage the citations and remove any duplicate publications.

The complete search strategy that was utilized for Ovid MEDLINE has been included in Supplemental Table 1.

Supplemental strategies:

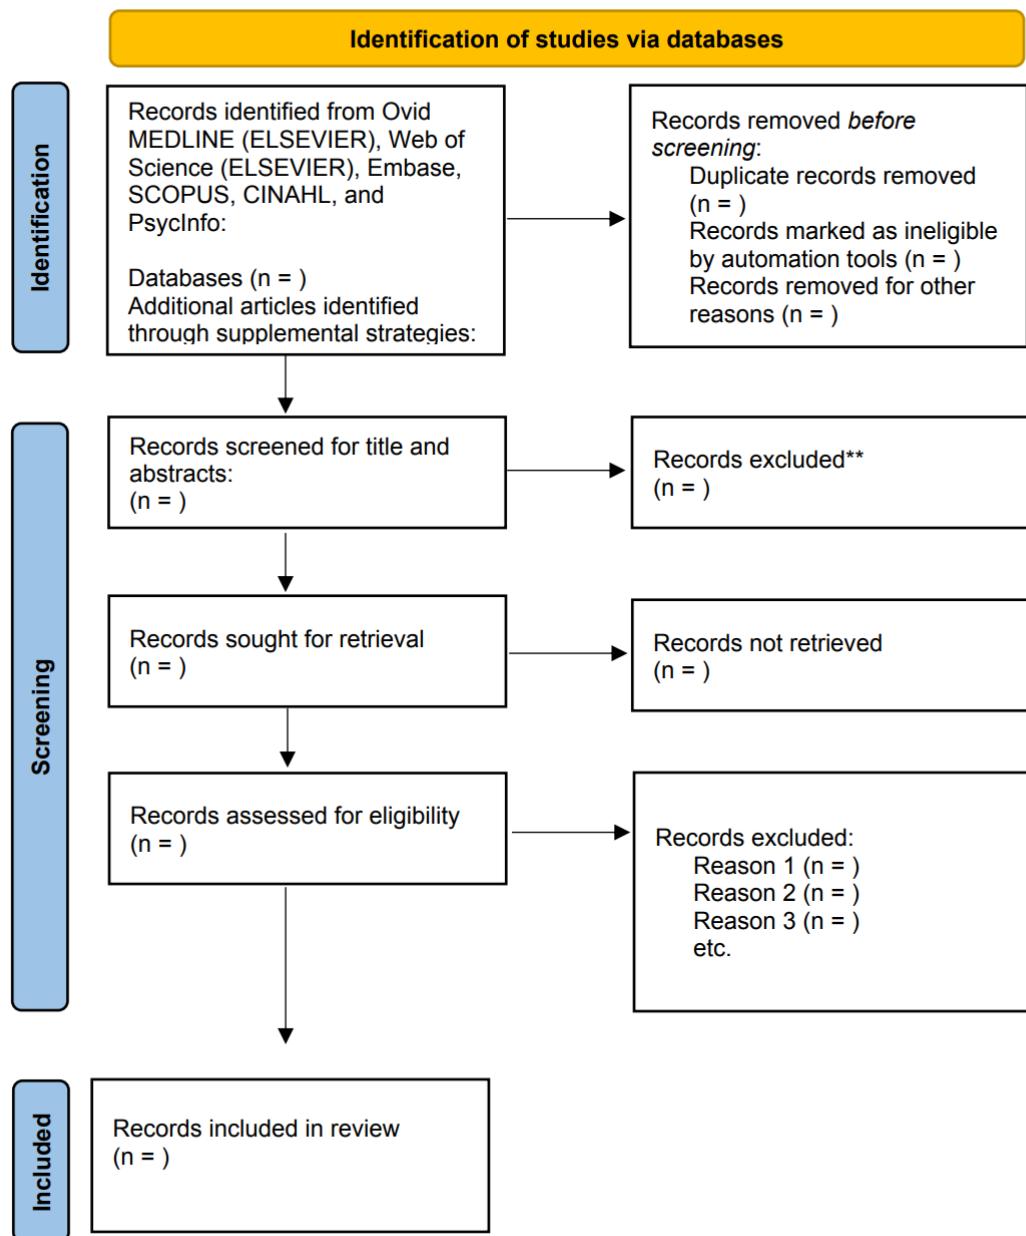

In addition to the primary search, the review team will examine the literature of scoping reviews or systematic reviews and the literature within the primary research articles to identify any additional references.

Source of evidence selection:

The Rayyan-Intelligent Systematic Review program (Rayyan Systems Inc., Cambridge, MA) will be used to review publications, including the pilot phase. Selected scoping review articles will follow the exclusion and inclusion criteria presented above. They will include a review of the title and abstract, preceded by a complete review of the evidence within the manuscript.

Scoping review screeners will complete an initial training by reviewing the protocol developed for this scoping review. Next, screeners will complete a pilot test using a subset (10%) of the total articles identified and pilot screening will commence once 75% of agreement has been reached between the two primary screeners for the pilot test (PMH and MLA or SEP or KE). When completing the screening, at least 2 screeners will review each source at each level (title abstract and full-article review) and disagreements will be reconciled by consensus or by a third screener. In accordance with the PRISMA-ScR statement, a flowchart and narrative description of the evidence selection process will be created as presented in Figure 1.

Figure 1. Review Process

Data extraction/charting: The scoping review data extraction and charting will include the following data from each data source:

- 1) Title
- 2) Author(s)

- 3) Year
- 4) Country (where the source was published or conducted)
- 5) Aims/Purpose of the study
- 6) Location
- 7) Topic of the study (Vision condition or eye care)
- 8) Housing pillar assessed
- 9) Social risk factor assessed
- 10) How findings for source were obtained (interview, survey, electronic medical record, etc.)
- 11) Type of the study (cross-sectional, case-control, cohort, etc.)

This initial list of variables will be used during the pilot portion of the scoping review and refined as necessary. If additional variables are needed during the screening and data extraction process, the data extraction form will be updated accordingly.

Analysis of the evidence: Frequency counts will be used to assess the presence of housing pillars and social risk factors within the pillars identified for vision conditions/eye care. Population demographics, types of diagnoses and other fields of data extracted from evidence will be calculated.

Presentation of the Results: The results of this scoping review will be presented in tables (Table 2 and Table 3). These tables will highlight the identified studies pertaining to social risk factors and eye conditions, frequency and percentage of domain by location (United States vs. International), and the associated social risk factors.

Table 2. Identified publications for social risk factors with Eye Conditions

Author(s)	Name of author(s) on the publication
Year	Year published
Location	Country where the study took place
Study Topic	Vision Health Condition (Type) or Eye Care
Pillars of Housing	Cost Consistency Conditions
Social Risk Factors	Social risk factors associated with housing

Table 3. Domain frequency and percentage by location

Pillar of Housing	Cost Consistency Conditions
Location	United States International
Number of Publications	Number of publications by location
