| 19. ABSTRACT (Continue on reverse if necessary and identify by block number)<br>This report provides a summary of experimental observations of the radar backscatter from terrain,<br>as reported in the literature. The data is at 35, 94, 140 and 225 GHz, primarily at HH, VV, and HV<br>polarizations. The terrain types observed include dry and wet snow, in-covered ground, trees, grasses,<br>asphalt, gravel, and others. |  |   |                            |                        |                |             |                            |

## I. INTRODUCTION

Version 1.0 of this Handbook provided plots of millimeter-wave (MMW) radar scattering data for terrain based on measurements made by the University of Michigan's Millimeter-Wave Polarimeter system at 35, 94, and 140 GHz. The present edition, Version 2.0, includes the University of Michigan data as well as data reported by The University of Massachusetts, The University of Kansas, Ohio State University, and data from other institutions.

Most of the data are presented in the form of plots of the backscattering coefficient  $\sigma^0$  versus the incidence angle  $\theta$ , measured relative to normal incidence, although some plots of  $\sigma^0$  versus time are included also. The radar data are augmented with photographs and close-up observations of the target whenever such information is available in the data source. In some cases, the original data were reported as a function of depression angle, instead of incidence angle, or in terms of  $\gamma$ , where

$$\gamma = \sigma^0 / \cos \theta.$$

For the sake of consistency and in order to make comparison of data more useful, all such data were converted to  $\sigma^0$  versus  $\theta$ .

No effort will be made in this handbook to provide any analysis of the radar data or to compare the data with model predictions. Instead, a list of relevant publications is given in the bibliography for the interested reader.

## PART I. UNIVERSITY OF MICHIGAN DATA

The Millimeter-Wave Polarimeter is a truck-mounted radar system capable of making observations from a 20-m high platform at any incidence angle between 0° (normal incidence) and 80°. In some cases, however, because of truck-access considerations or signal-to-noise limitations, it was not possible to make observations over this entire angular range. Figure I-1 shows a photograph of the system in operation and Figure I-2 shows a close-up of the antenna platform. Table I-1 provides a summary of the system specifications.

The list below provides definitions for the quantities quoted in conjunction with the radar data presented in this part of the Handbook.

### TERMINOLOGY

**Average Leaf (or Needle) Dimensions** - the approximate main axis length of the individual leaves (or needles).

**Backscattering Coefficient** - radar cross-section per unit area averaged over the illuminated area of the radar footprint, expressed in dB. Also referred to as Sigma-zero or  $\sigma^0$ .

**Cut** - this term is applied to grasses when they have been cut, and no longer have the natural termination on their blades.

**Data set code** - the unique alphanumeric sequence describing each data set. Typically it is the date of the measurement, in the sequence YYMMDD, with a numeric suffix if required for uniqueness.

**Snow Density** - the mass/volume density of undisturbed samples taken from the snowpit.

**Snow Depth** - the distance from the average top level of the snow to the underlying ground.

**Ice Crystal Diameter** - the approximate semi-major axis of an individual scatterer. This is typically a statistical quantity, arrived at by examining a number of individual scatterers.

**Dry** - a material is called "dry" when its moisture content (in the case of soils and vegetations) or its liquid water content (in the case of snow) is within experimental uncertainty of 0 %.

**Snow Liquid Water Content (LWC)** - the quantity of liquid (non-frozen) water contained in snow, by weight (gravimetric), measured in percent.

**Metamorphosed** - snow crystals having extensively undergone the natural sublimation process that alters their shape from its original form toward the spherical.

**Moisture Content** - the percent of water, by mass, contained in a representative sample of soil or vegetation. The measurement consists of weighing a sample in its natural state, and again after drying it in an oven.

**Percent Ground Cover** - the percent of the ground covered by tree vegetation when viewed from above.

**Rough** - this term is applied to surfaces which are typically rougher than the natural state in which they are usually found. Often, in the case of soils or snow, it is used to describe a surface that has been artificially roughened.

**Smooth** - this term is applied to surfaces which are smooth compared to the natural state in which they are usually found. Sometimes it may be used to describe a surface which has been artificially smoothed.

**Surface RMS Height** - the root-mean-square deviation of the surface height relative to the mean surface

**Surface Temperature** - the temperature registered by a mercury-bulb thermometer with the bulb just covered by the top layer of the surface.

**Tree Density** - number of trees per unit area.

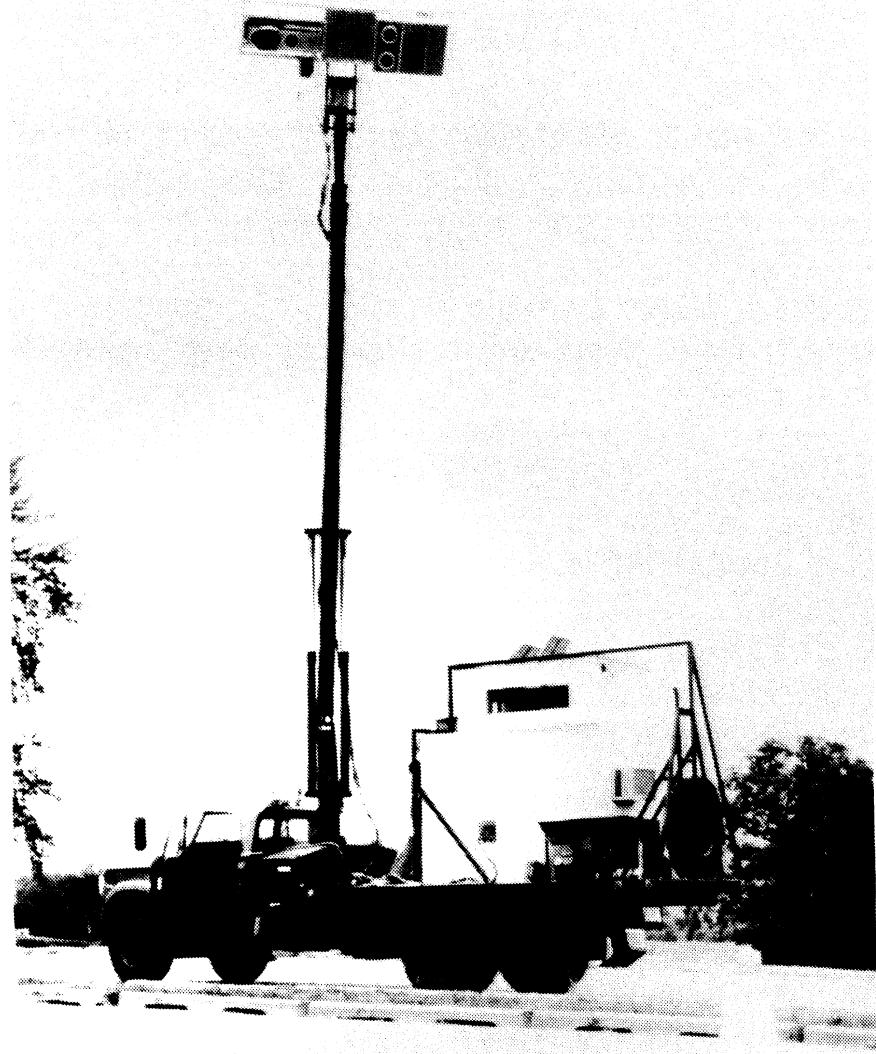

Fig. I-1 Photograph of the Millimeter-Wave Polarimeter system with the boom extended about half way.

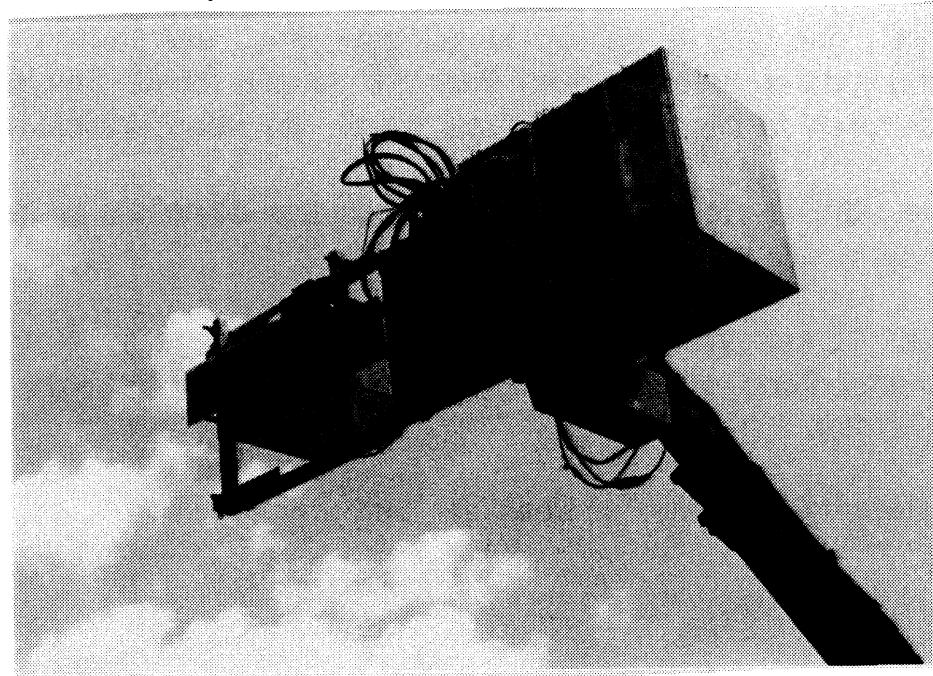

Fig. I-2. Close-up view of the RF sections, showing the 35, 94, and 140 GHz radars on the right side, and radiometers at the same operating frequencies on the left side.

**Table I-1. Millimeter-wave Polarimeter system parameters.**

## 2. MMW DATA FOR DRY SNOW

Snow is a very complex target and many of the following data sets could be categorized in several ways. In the interests of simplifying the data organization, and facilitating its use by the reader, the data have been categorized into subsections by their most salient feature.

The following chart is included in order to give a more complete overview of the characteristics of the data:

|               | smooth surface | slightly rough surface | very rough surface | heavily metamorphosed | unmetamorphosed fresh | small crystal size | large crystal size |
|---------------|----------------|------------------------|--------------------|-----------------------|-----------------------|--------------------|--------------------|
| Data Set Code | A              | B                      | C                  | D                     | E                     | F                  | G                  |
| 880329 (S)    | X              |                        |                    | X                     |                       |                    | X                  |
| 880329 (SR)   |                | X                      |                    | X                     |                       |                    | X                  |
| 880329 (VR)   |                |                        | X                  | X                     |                       |                    | X                  |
| 890210        | X              |                        |                    | X                     |                       |                    | X                  |
| 890223        | X              |                        |                    |                       | X                     | X                  |                    |
| 890302 (SM)   | X              |                        |                    |                       | X                     | X                  |                    |
| 890302 (LG)   | X              |                        |                    |                       | X                     |                    | X                  |
| 890307 (RO)   |                | X                      |                    |                       | X                     |                    | X                  |
| 890307 (SM)   | X              |                        |                    |                       | X                     |                    | X                  |

# MMW DATA FOR DRY SNOW

## A. Smooth Surface

Dry snow

Data set code: 880329(S)

Depth: 20-30 cm

LWC: 0 %

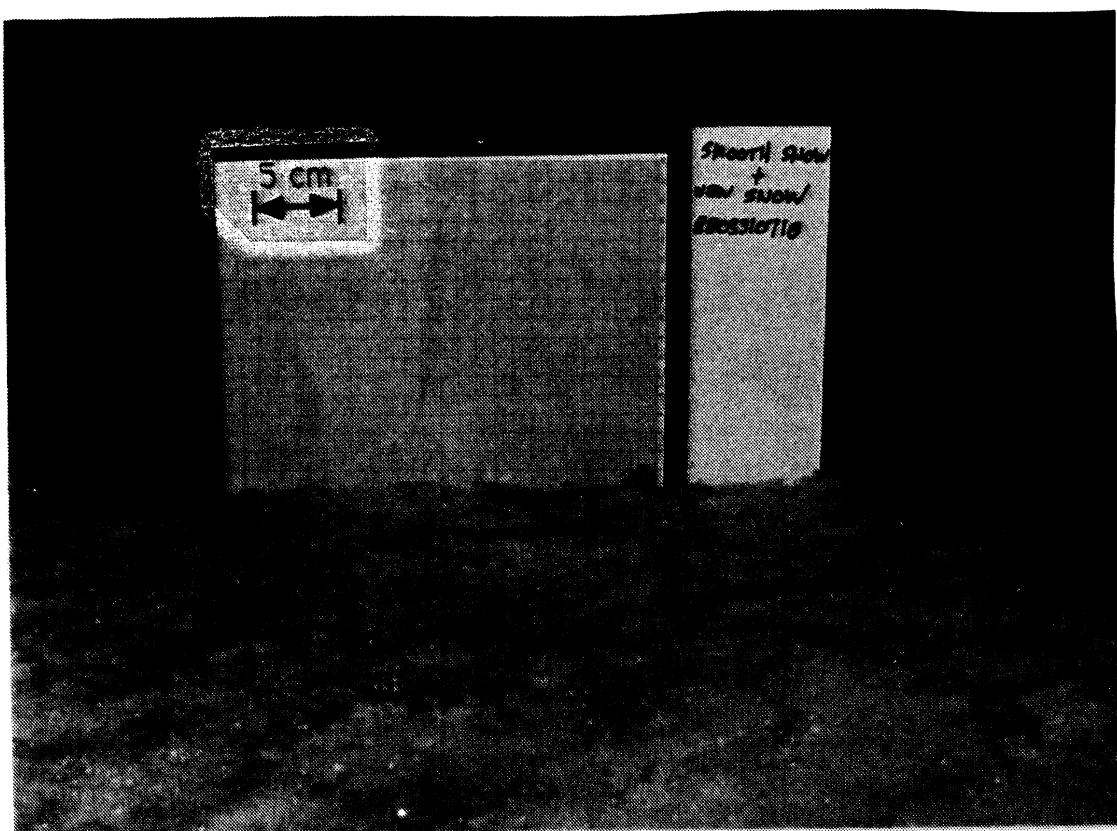

Surface RMS height: 1 cm

Density: 0.3 to 0.4 gm/cm<sup>3</sup>

Ice crystal diameter: 1 to 4 mm

Surface temperature: -2.0 C

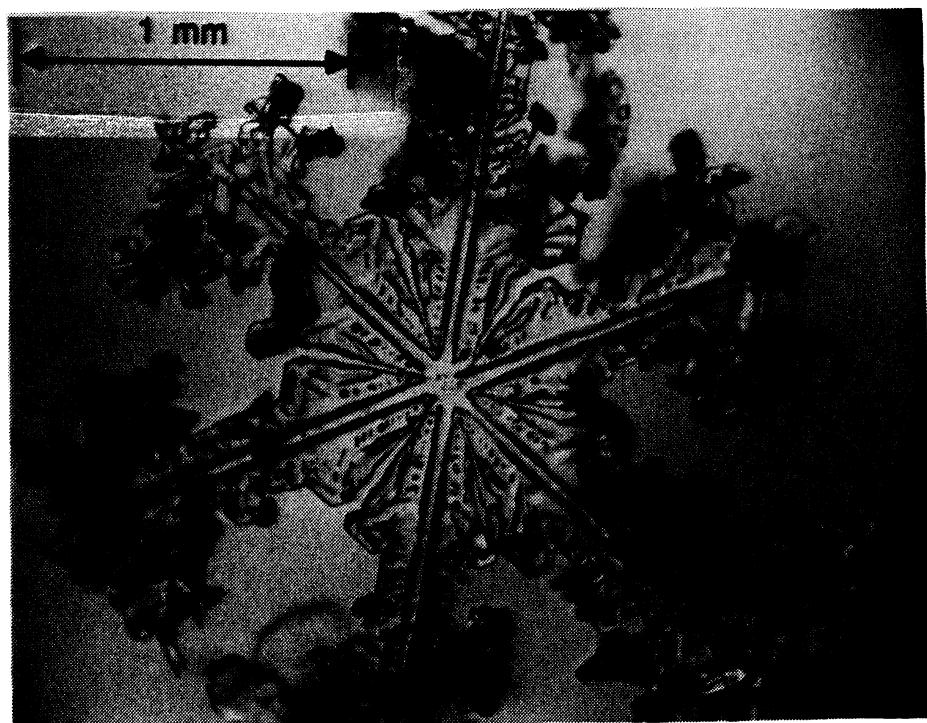

Description: smooth snow surface

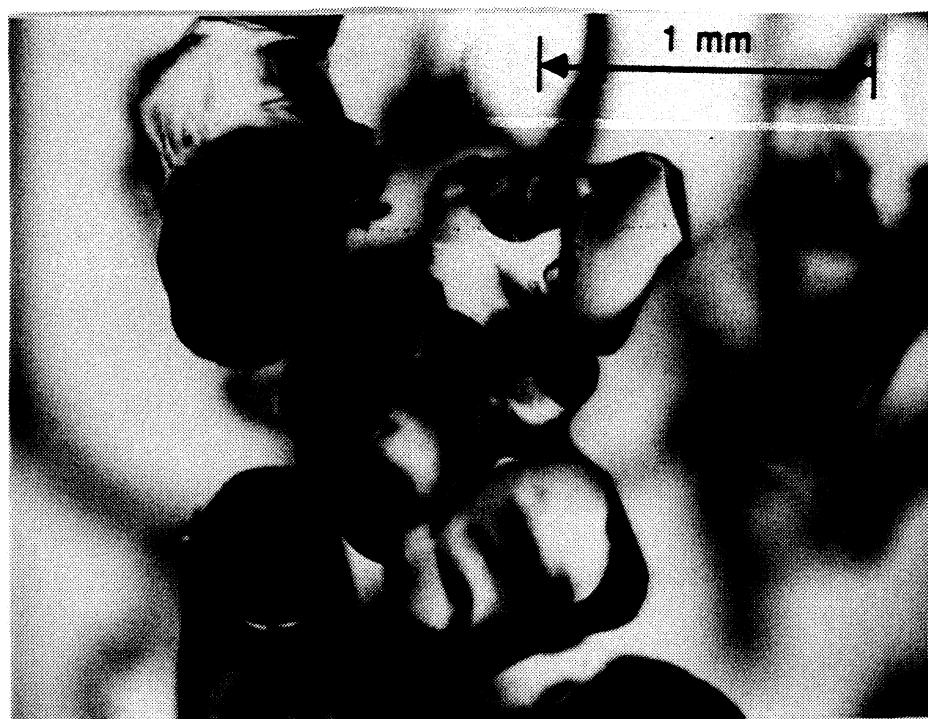

Surface roughness profile with 1 cm grid

# MMW DATA FOR DRY SNOW

880329(S)

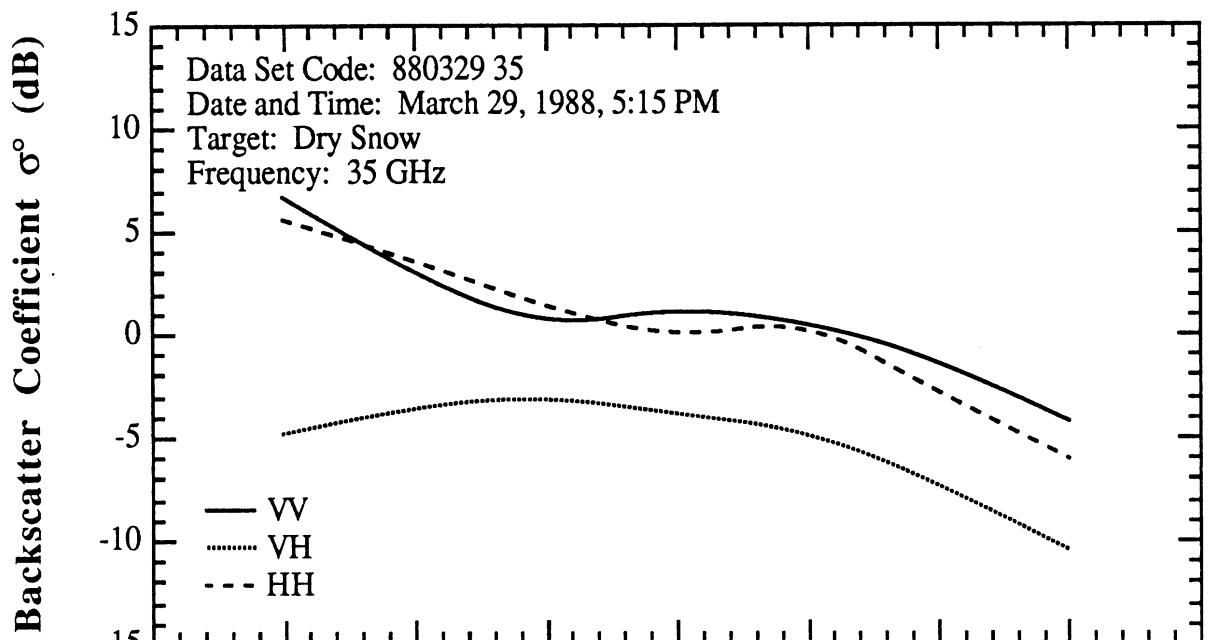

Snow crystal from surface

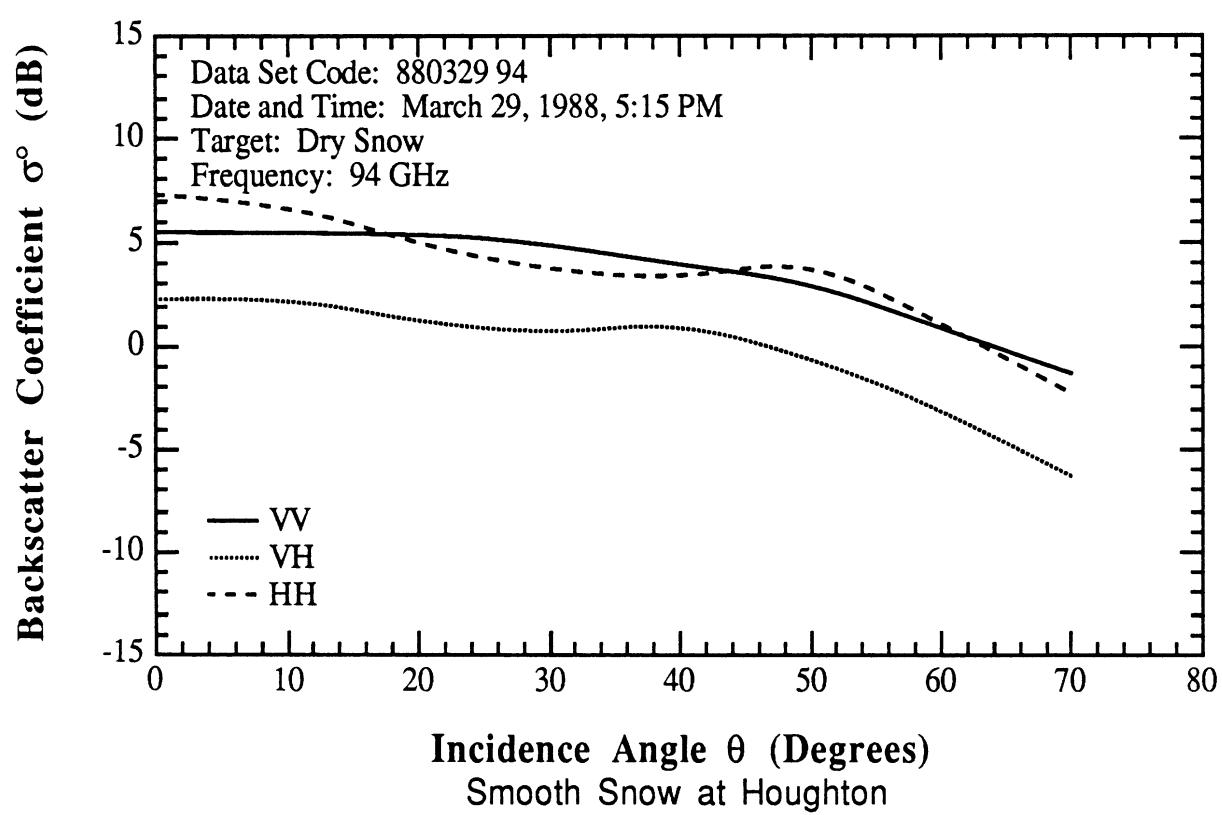

Metamorphosed crystal from middle of snowpack

## MMW DATA FOR DRY SNOW

880329(S)

Smooth Snow at Houghton

## B. Slightly Rough Surface

Dry snow

Data set code: 880329 (SR)

Depth: 20 to 30 cm

LWC: 0%

Surface RMS height: 1 cm

Density: 0.3 to 0.4 gm/cm<sup>3</sup>

Ice crystal diameter: 1 to 4 mm

Surface temperature: 0 C

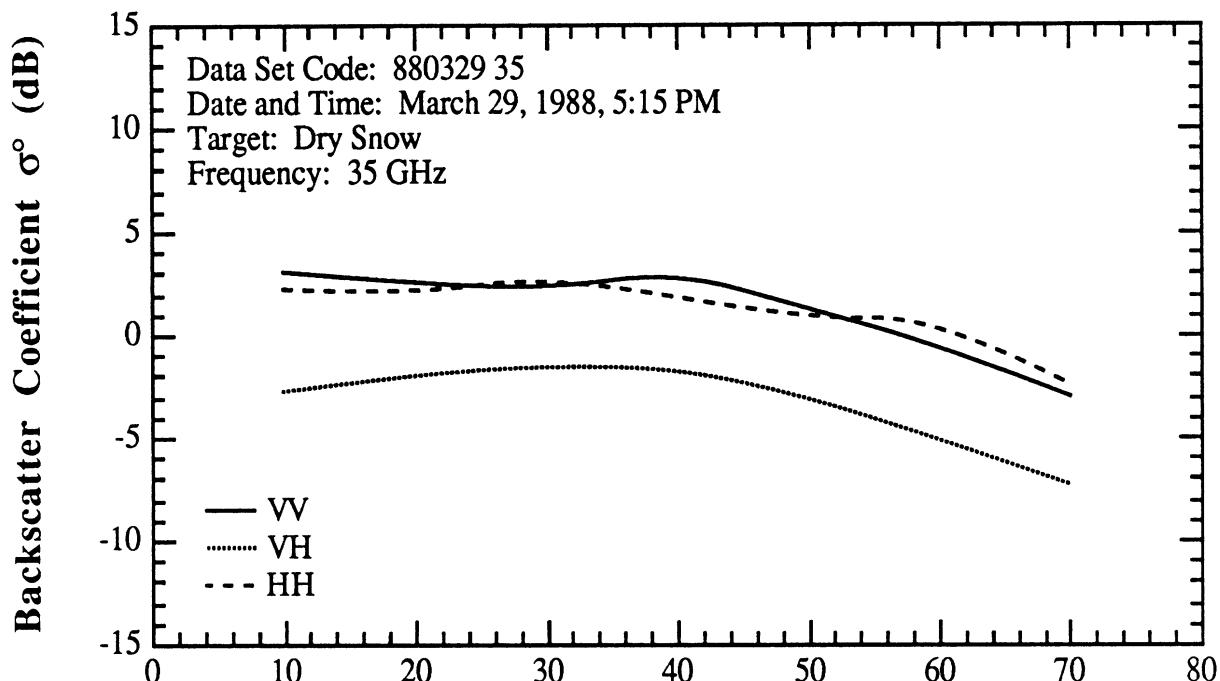

Description: snowpack of highly metamorphosed  
snow with a slightly rough surface

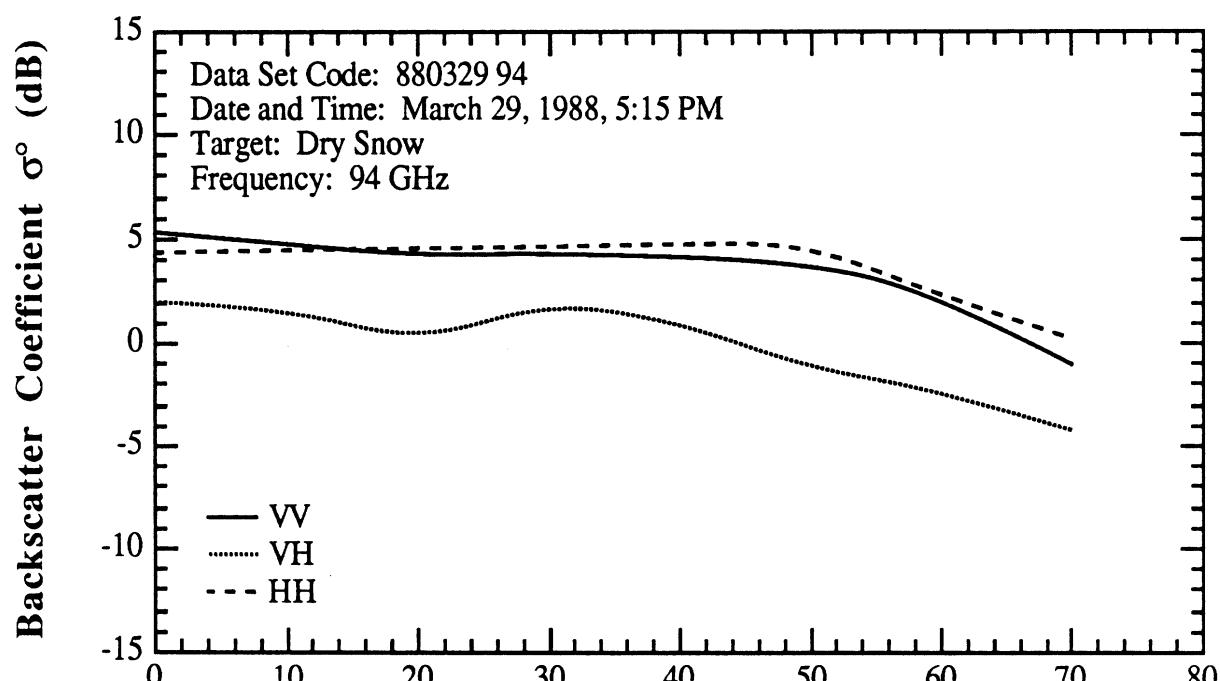

Surface roughness profile with 1 cm grid

## MMW DATA FOR DRY SNOW

880329(SR)

Incidence Angle  $\theta$  (Degrees)  
Slightly rough snow at Houghton

Incidence Angle  $\theta$  (Degrees)  
Slightly rough snow at Houghton

### C. Very Rough Surface

Dry snow

Data set code: 880329(VR)

Depth: 20 to 30 cm

LWC: 0%

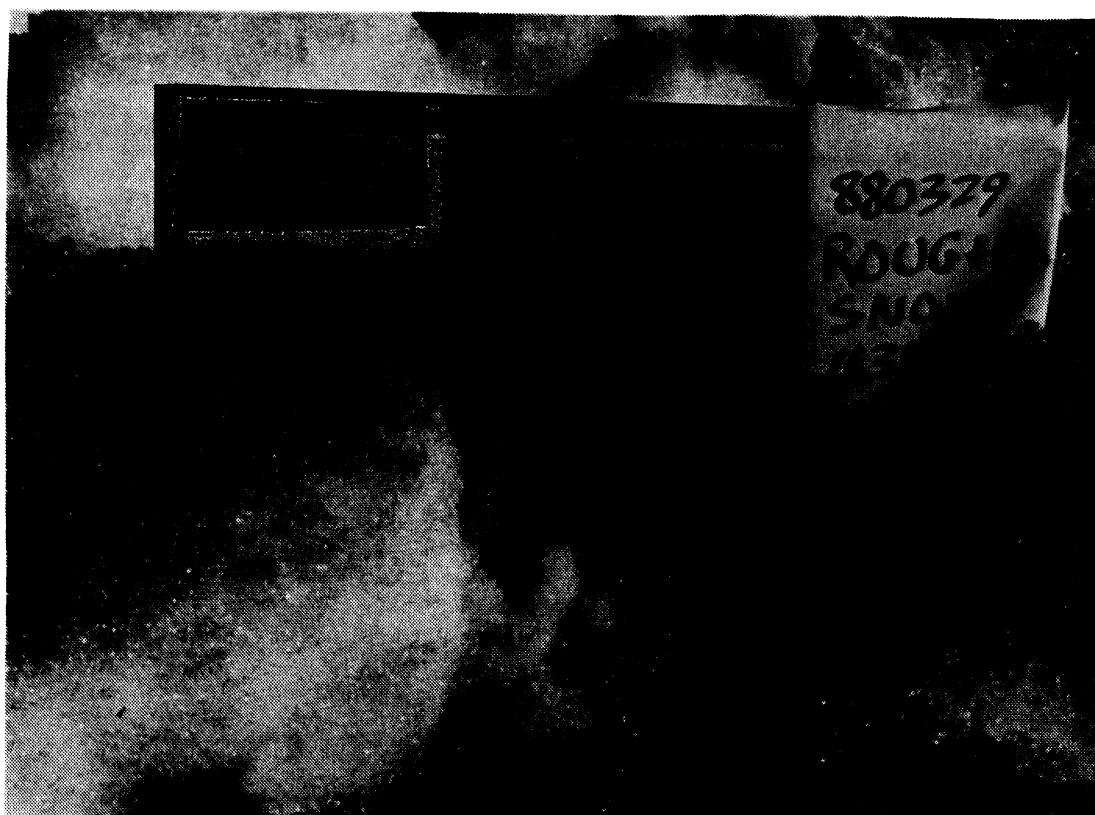

Surface RMS height: 4 cm

Density: 0.3 to 0.4 gm/cm<sup>3</sup>

Ice crystal diameter: 1 to 4 mm

Surface temperature: 0 C

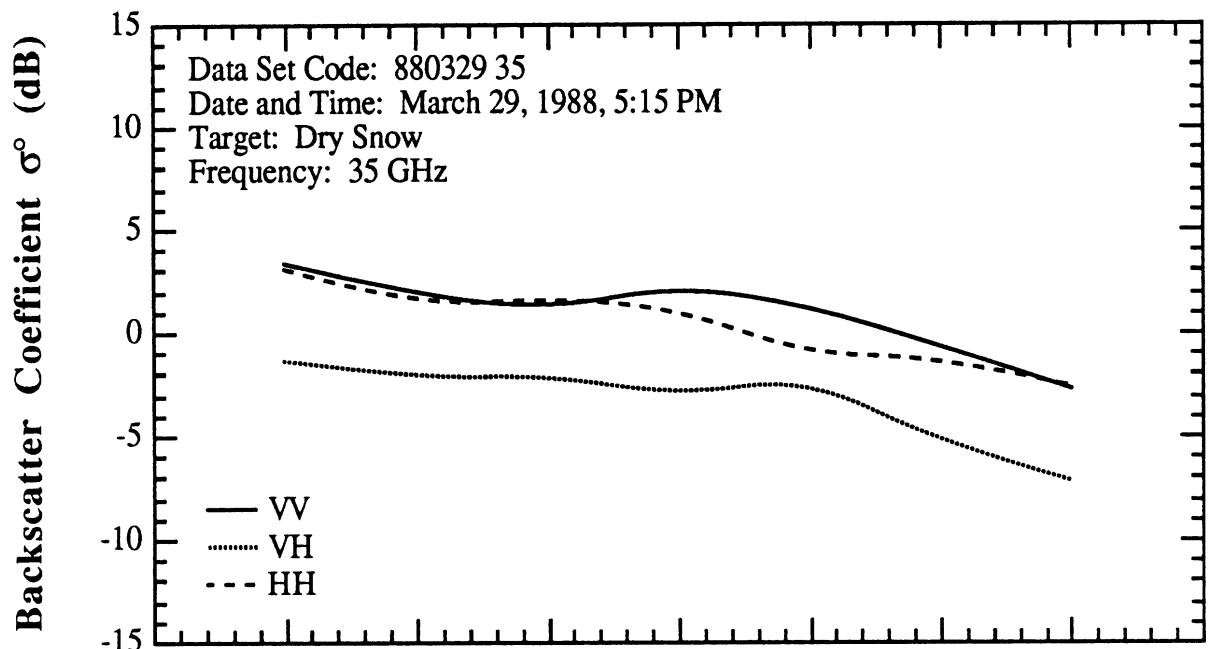

Description: snowpack of highly metamorphosed  
snow with a rough surface

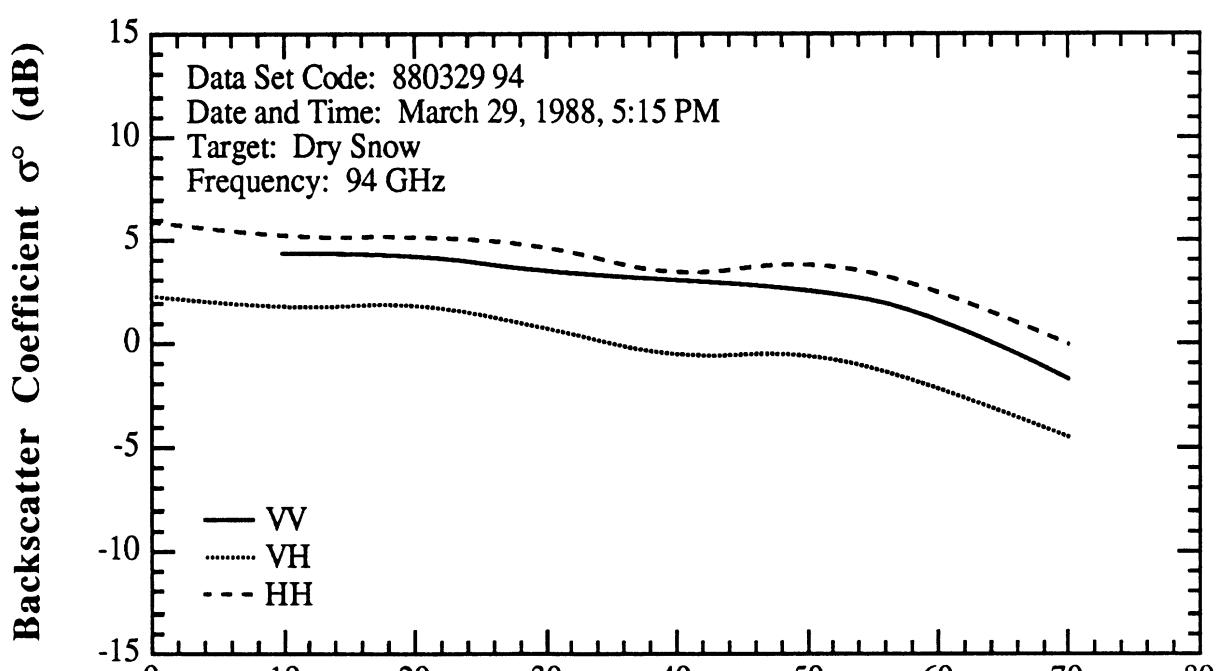

Surface roughness profile with 1 cm grid

## MMW DATA FOR DRY SNOW

880329(VR)

Incidence Angle  $\theta$  (Degrees)  
Very rough snow at Houghton

Incidence Angle  $\theta$  (Degrees)  
Very rough snow at Houghton

#### D. Heavily Metamorphosed Snow

Dry snow

Data set code: 890210

Depth: 27 cm

LWC: 0.0 %

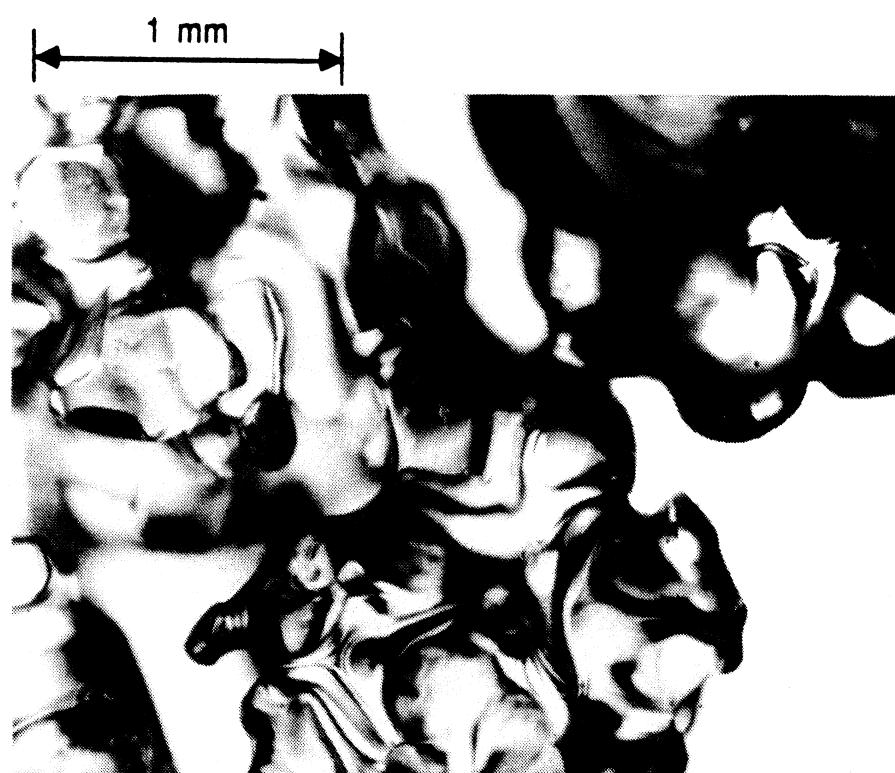

Surface RMS height: ~ 1 cm

Density: 0.5 gm/cm<sup>3</sup>

Ice crystal diameter: 2 to 4 mm

Surface temperature: -4.8 C

Description: heavily metamorphosed snow

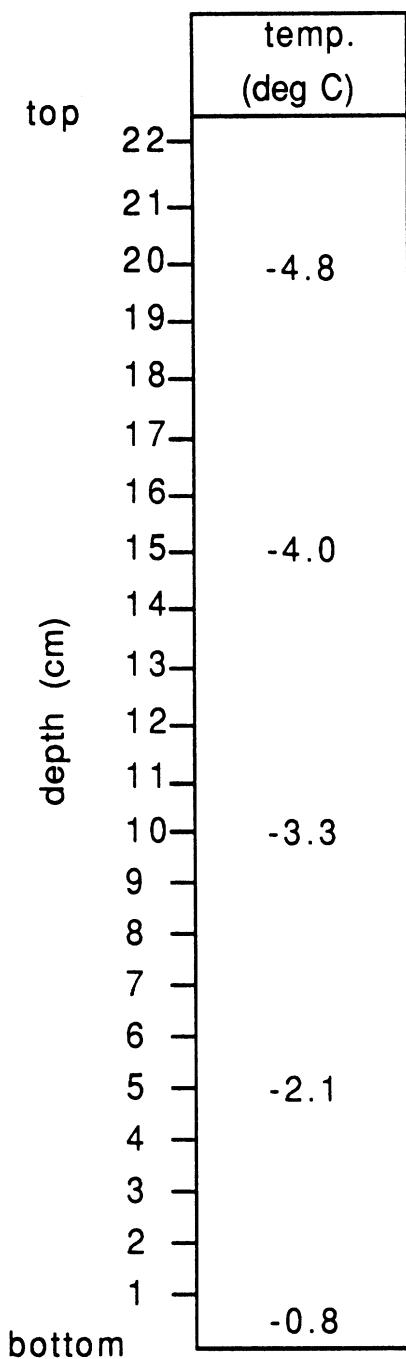

Metamorphosed crystal from top of the snowpack

**MMW DATA FOR DRY SNOW**

**890210**

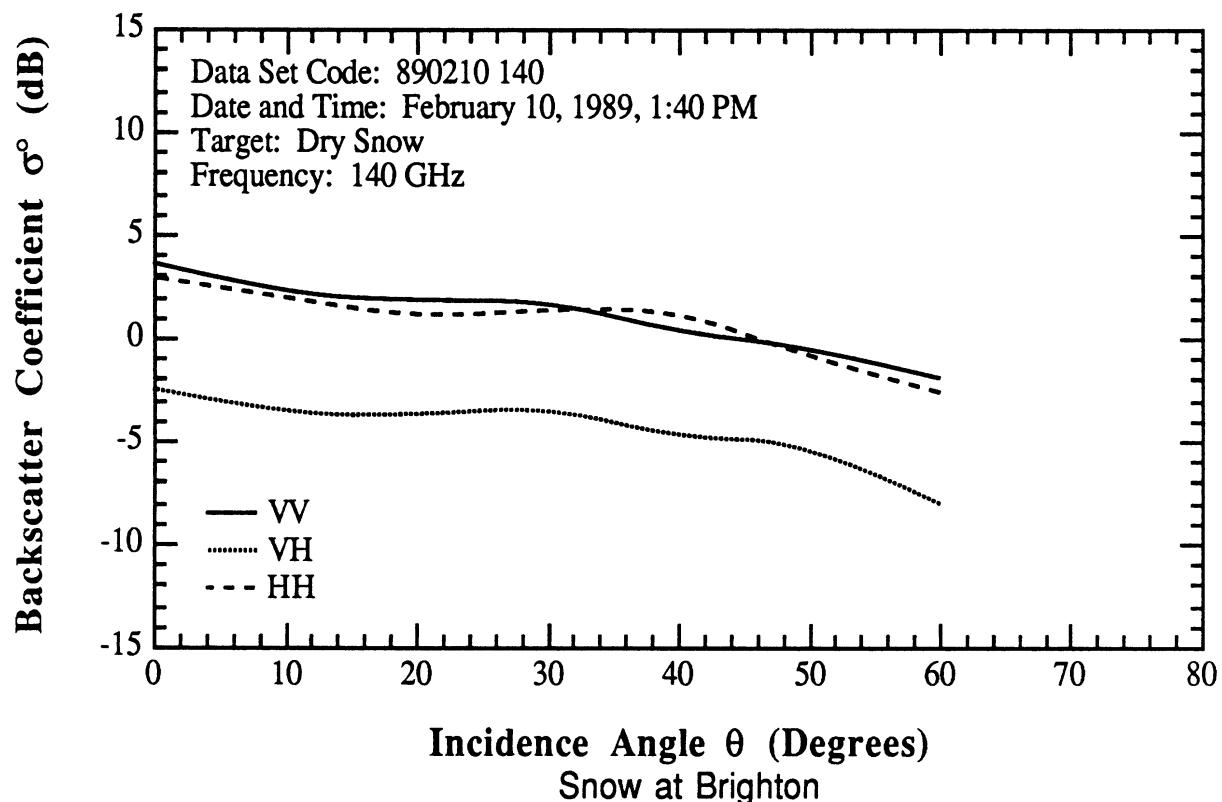

**SNOW PIT PROFILE FOR 890210**

air temperature: -4.4 C

# MMW DATA FOR DRY SNOW

### I. Large Crystal Size with Smooth Surface

Dry snow

Data set code: 890307 (Sm)

Depth: 10 cm

LWC: 0 %

Surface RMS height: 0.28 cm

Ice crystal diameter: 2 to 4 mm

Density: 0.4 gm/cm<sup>3</sup>

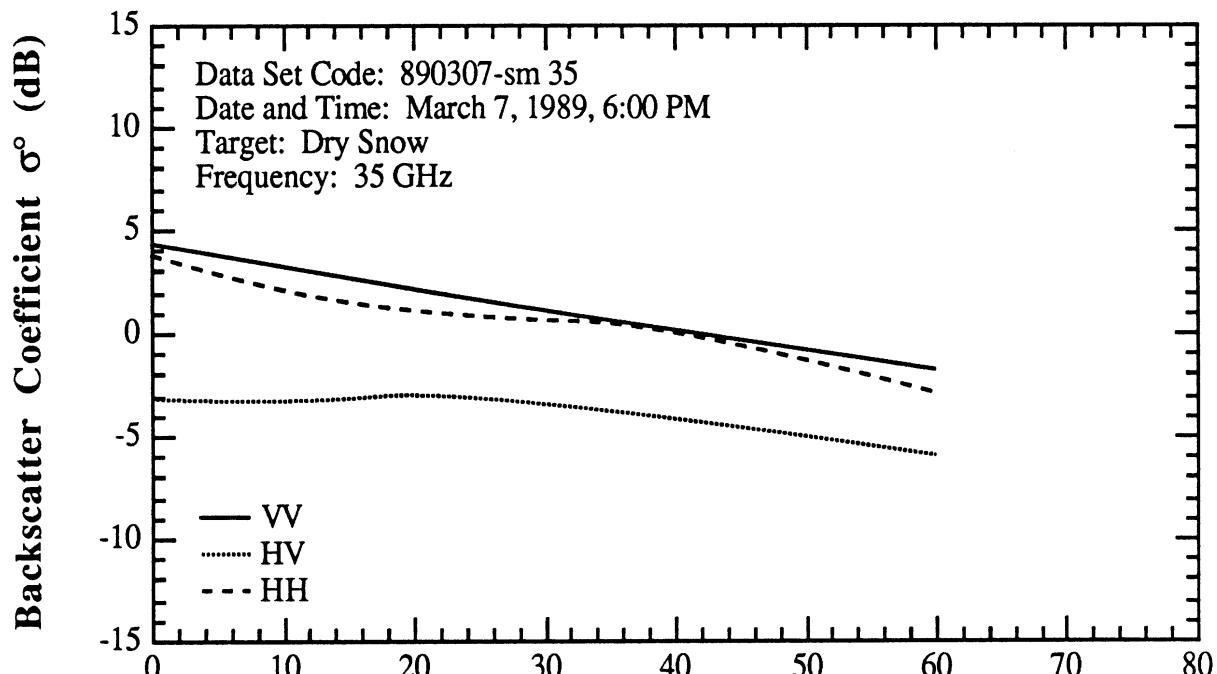

Surface temperature: -10 to -12 C

Description: dry slightly metamorphosed snow

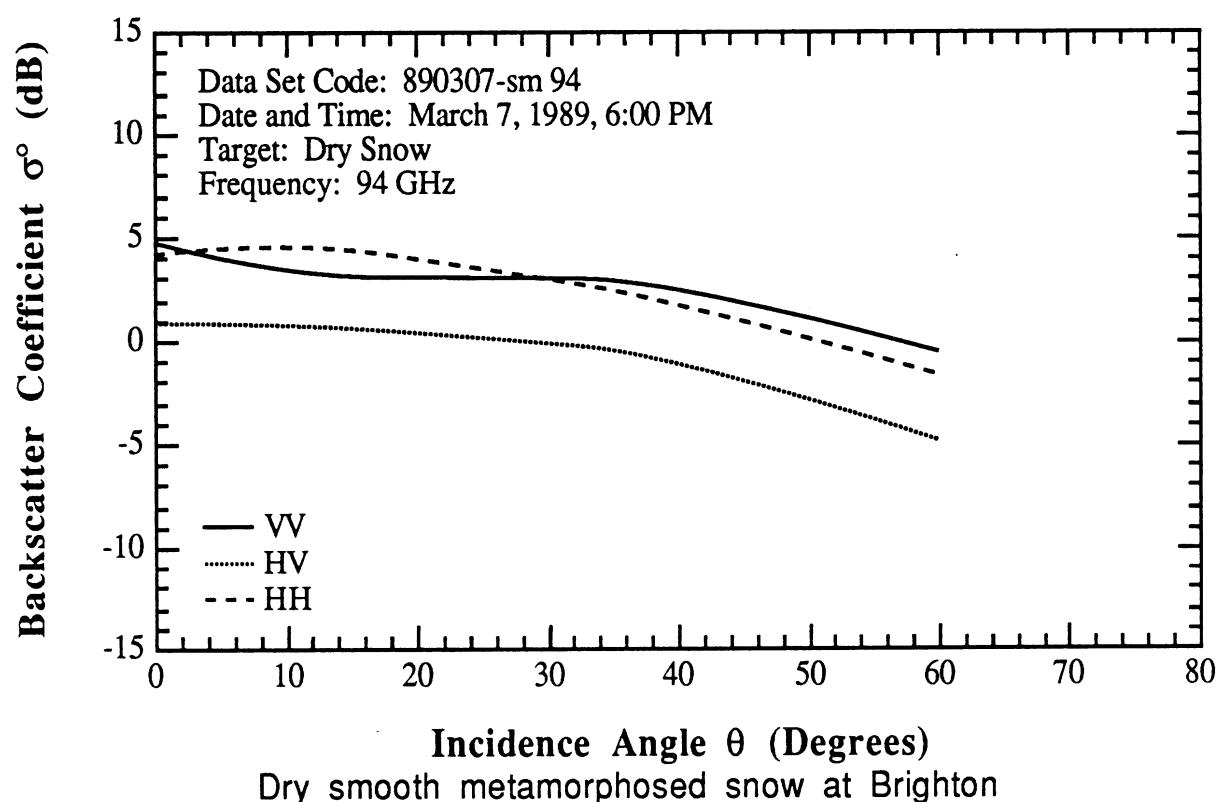

## MMW DATA FOR DRY SNOW

890307(SM)

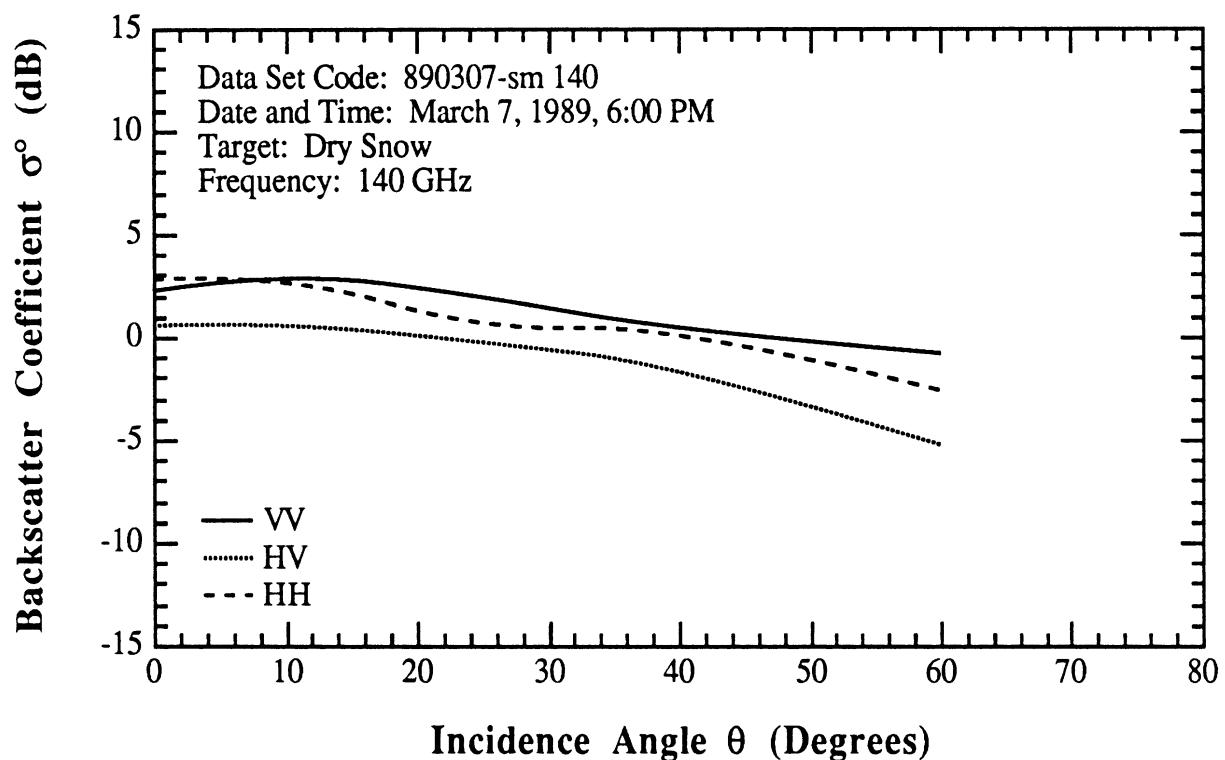

Incidence Angle  $\theta$  (Degrees)

Dry smooth metamorphosed snow at Brighton

## MMW DATA FOR DRY SNOW

890307(SM)

Dry Smooth metamorphosed snow at Brighton

### 3. MMW DATA FOR WET SNOW

As in the previous chapter on Dry Snow, the following chart is included in order to give a more complete overview of the characteristics of the data:

|                   | manmade wet | slightly wet with smooth surface | wet w/ smooth surface | very wet with rough surface | very wet with smooth surface |
|-------------------|-------------|----------------------------------|-----------------------|-----------------------------|------------------------------|
| Data Set Code     | A           | B                                | C                     | D                           | E                            |
| 890220            |             | x                                |                       |                             |                              |
| 890309 (vw w/ rs) |             |                                  |                       | x                           |                              |
| 890221            |             |                                  | x                     |                             |                              |
| 890309 (vw w/ ss) |             |                                  |                       |                             | x                            |
| 890215            | x           |                                  |                       |                             |                              |

## MMW DATA FOR WET SNOW

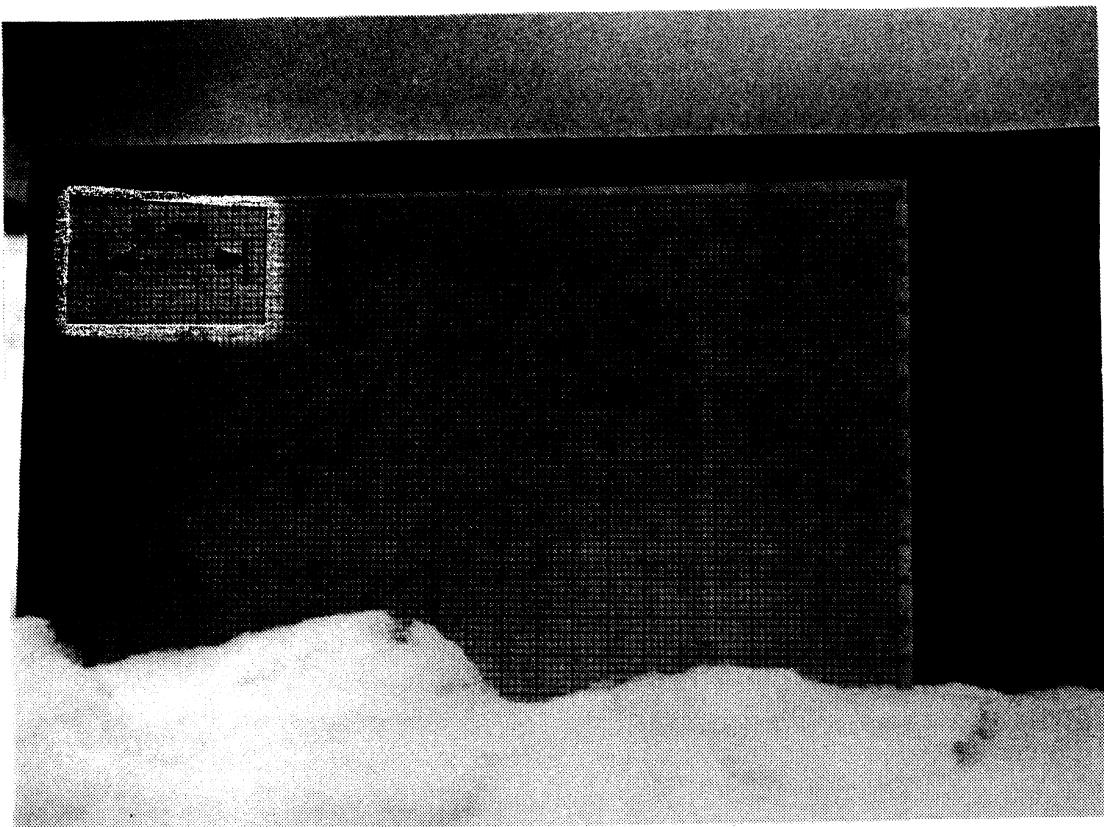

### A. Manmade Wet Snow

Wet snow  
Data set code: 890215  
Depth: 27 cm  
LWC: (at 3:25 PM): 8.82 %  
Surface RMS height: 1.6 cm  
Density: 0.48 gm/cm<sup>3</sup>  
Ice crystal diameter: 2 to 4 mm  
Surface temperature: 0.0 C

Angle of Incidence  $\theta$  (Degrees)  
Wet rough metamorphosed snow at Brighton

## E. Very Wet Snow with Smooth Surface

Data set code: 890309(SM)

Depth: 4.0 cm

LWC (at 2:30 PM): 16.89 %

LWC (at 3:09 PM): 15.47 %

Surface RMS height: 0.30 cm

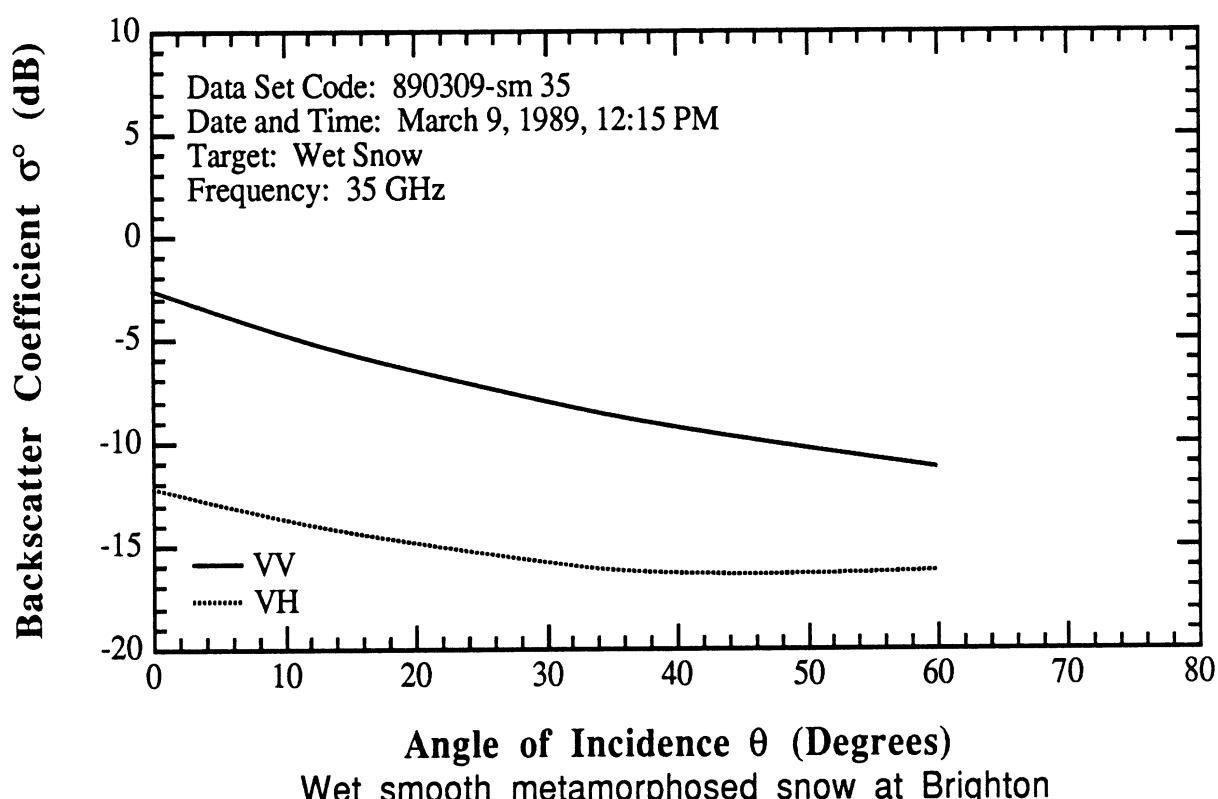

Density: 0.42 gm/cm<sup>3</sup>

Ice crystal diameter: 2 to 4 mm

Surface temperature: 4 to 6 C

Description: wet, smooth snow

**890309(SM)**

#### 4. MMW DIURNAL DATA FOR SNOW

A. 31 March 1988

##### Snow

Data set code: 880331

Depth: ~ 71 cm

LWC: 0 to 10.2 %

Smooth surface RMS height: 0.49 cm

Slightly rough surface RMS height: 0.88 cm

Very rough surface RMS height: 1.98 cm

Density: surface: 0.39

15 cm depth: 0.50 gm/cm<sup>3</sup>

30 cm depth: 0.54 gm/cm<sup>3</sup>

45 cm depth: 0.53 gm/cm<sup>3</sup>

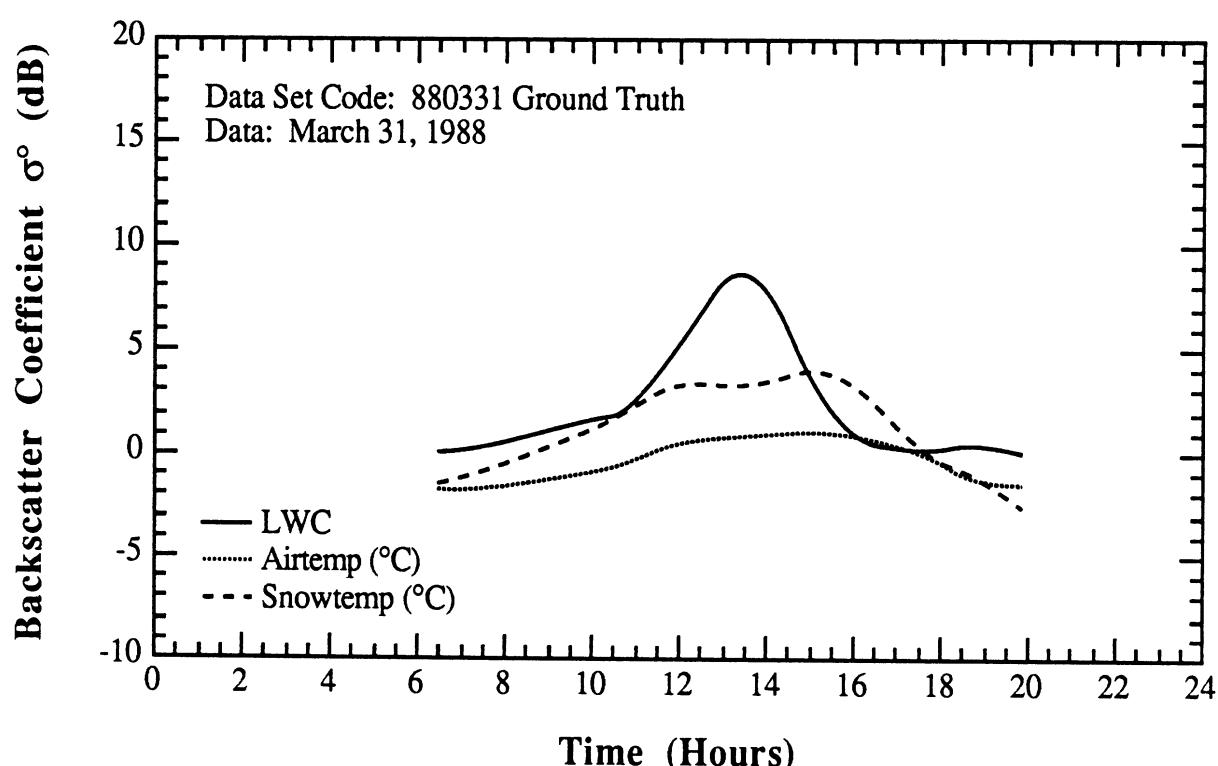

60 cm depth: 0.58 gm/cm<sup>3</sup>

71 cm depth (ground): 0.65 gm/cm<sup>3</sup>

Ice crystal diameter: 0.5 to 1mm

Surface temperature: -2.7 C to 4.5 C

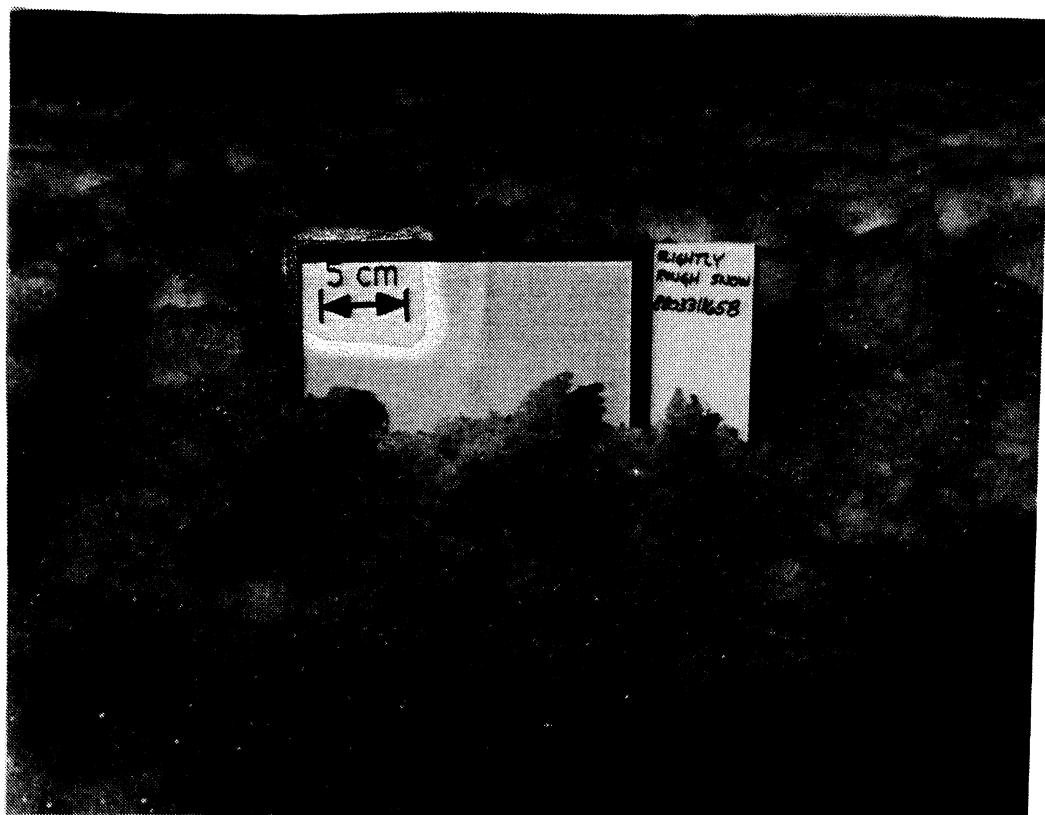

Description: metamorphosed snow divided into three sections, one natural surface (smooth), and two with roughened surfaces.

## PART II. UNIVERSITY OF MASSACHUSETTS DATA

Using a 215-GHz radar system, multipolarization backscatter measurements were made by the University of Massachusetts [15, 16] for various types of trees and for snow covered terrain in 1987 and 1988. The measurements were made from a 80-m high tower at the University of Massachusetts. The radar system used an extended interaction oscillator (EIO) capable of producing 100-ns pulses with 60 W of peak power. The transmit antenna consisted of a 15-cm lens fed by a corrugated scalar horn, with a beam width of 0.64°, and the receiver antenna was a horn with a wide beam width of 23°.

## 9. 215-GHZ DATA FOR TREES

Table II-1 provides a summary of the parameters of the trees for which the backscattering coefficient  $\sigma^0$  was measured. The radar observations were made as a function of time over an approximately six-month period, and were augmented with ground-truth measurements including:

**GLWC:** gravimetric liquid water content of leaves

**Cover:** percentage of the sky covered by leaves and branches as seen looking up from the base of the tree

**Normalized Leaf Area:** Average leaf area of between 10 and 50 leaf samples, normalized to the maximum value during the season.

TABLE II-1

CHARACTERISTICS OF TREES SELECTED FOR STUDY

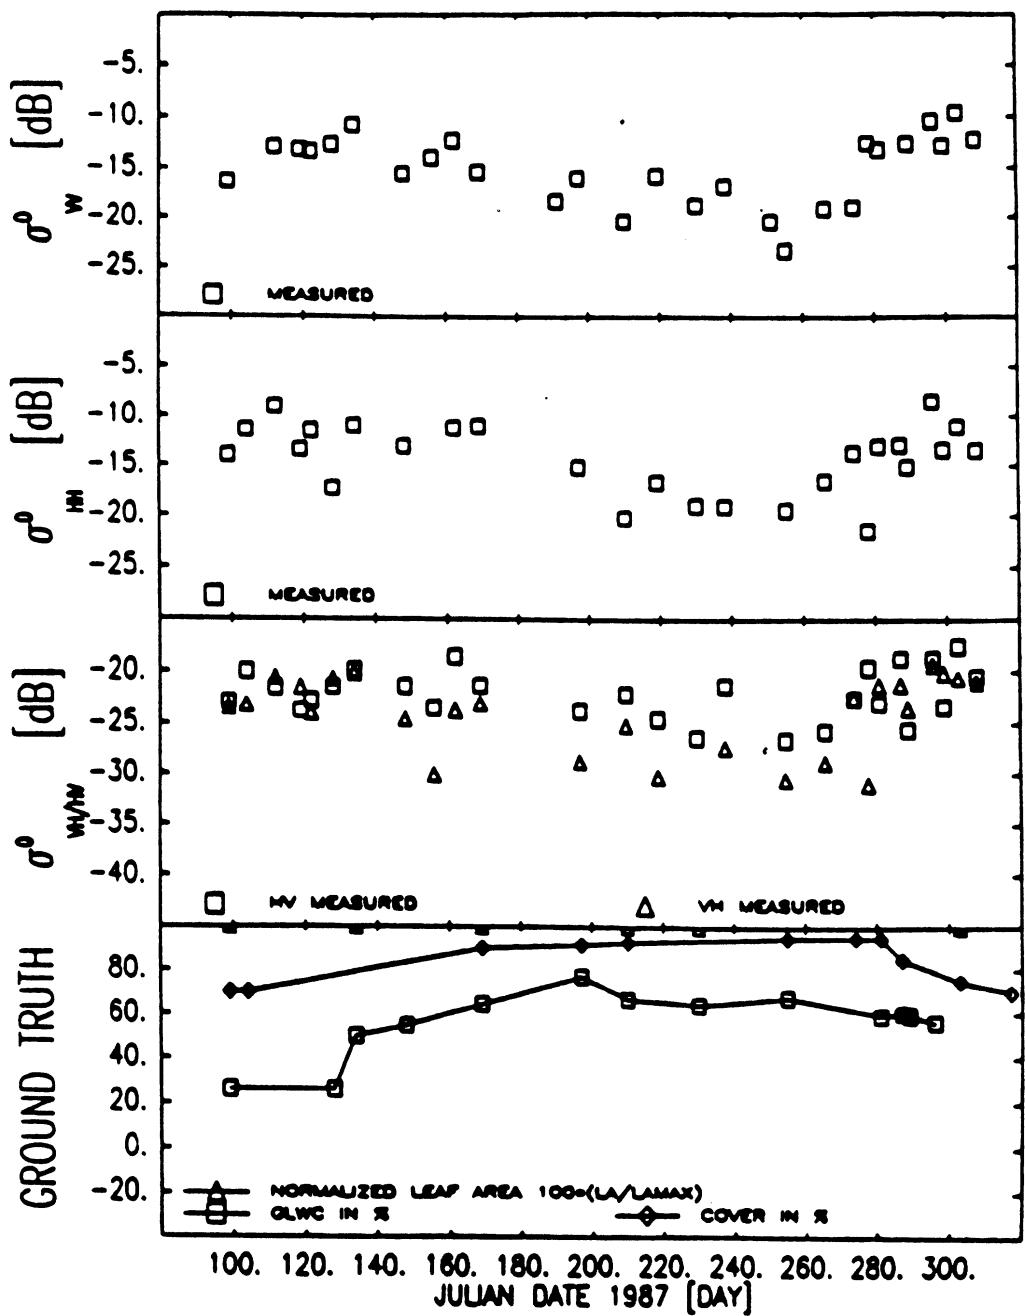

| Tree Code | Tree Name (Latin Name)                             | Basal Diameter [m] | Canopy Height [m] | Crown Diameter [m] | Canopy Cover Day 99 [%] | Canopy Cover 210 [%] | Tree Type | Position Depression [deg] | Position Azimuth [deg] |
|-----------|--|--------------------|-------------------|--------------------|-------------------------|----------------------|-----------|---------------------------|------------------------|
| A         | Northern White Cedar ( <i>Thuja occidentalis</i> ) | 0.15-0.3           | 13.               | 5.                 | 90                      | 90                   | C         | 28.8                      | 56.5                   |
| B         | White Pine ( <i>Pinus strobus</i> )                | 0.73               | 30.               | 16.                | 85                      | 90                   | E         | 20.8                      | 41.                    |

## WHITE PINE (B)

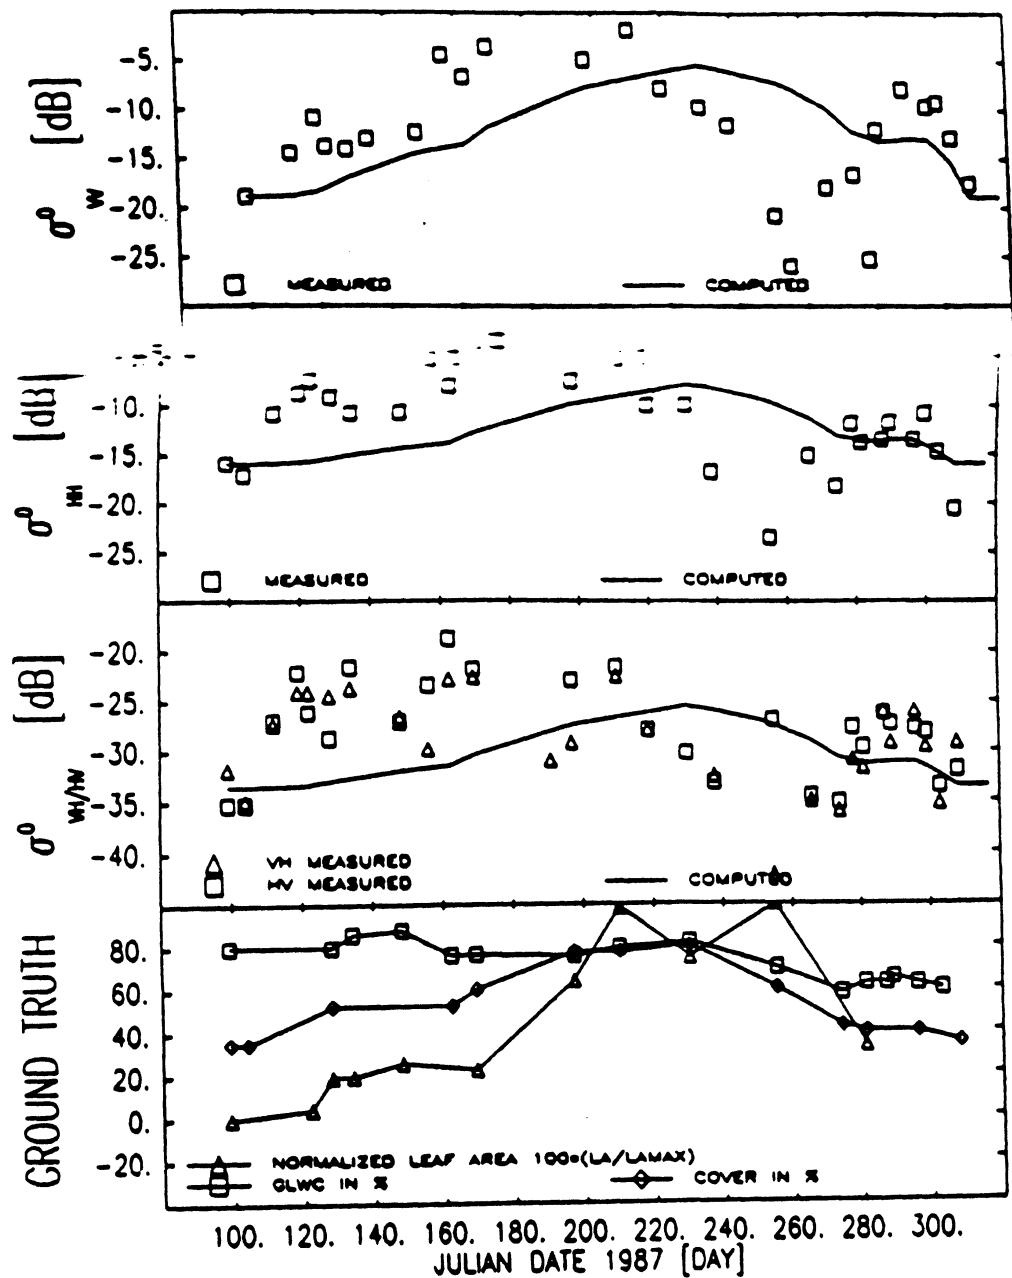

Curves showing measured  $\sigma^0$  versus Julian date for VV, HH, and VH/HV polarizations for White Pine (B). Also shown is the corresponding measured ground truth data.

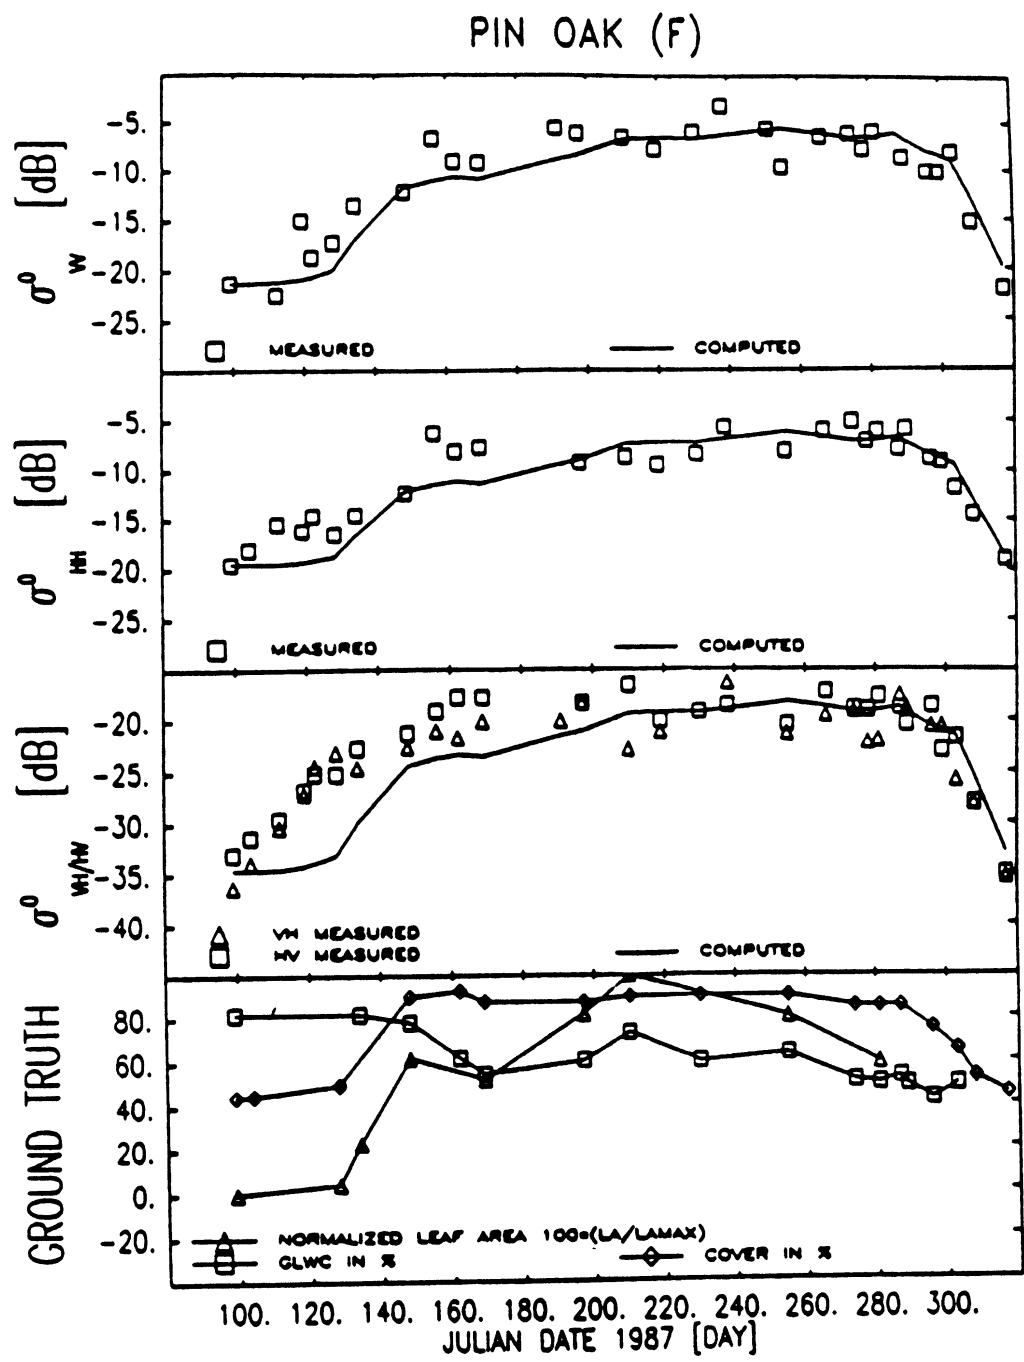

Curves showing measured  $\sigma^0$  versus Julian date for VV, HH, and VH/HV polarizations for Fir (C). Also shown is the corresponding measured ground truth data.

### EASTERN COTTONWOOD (E)

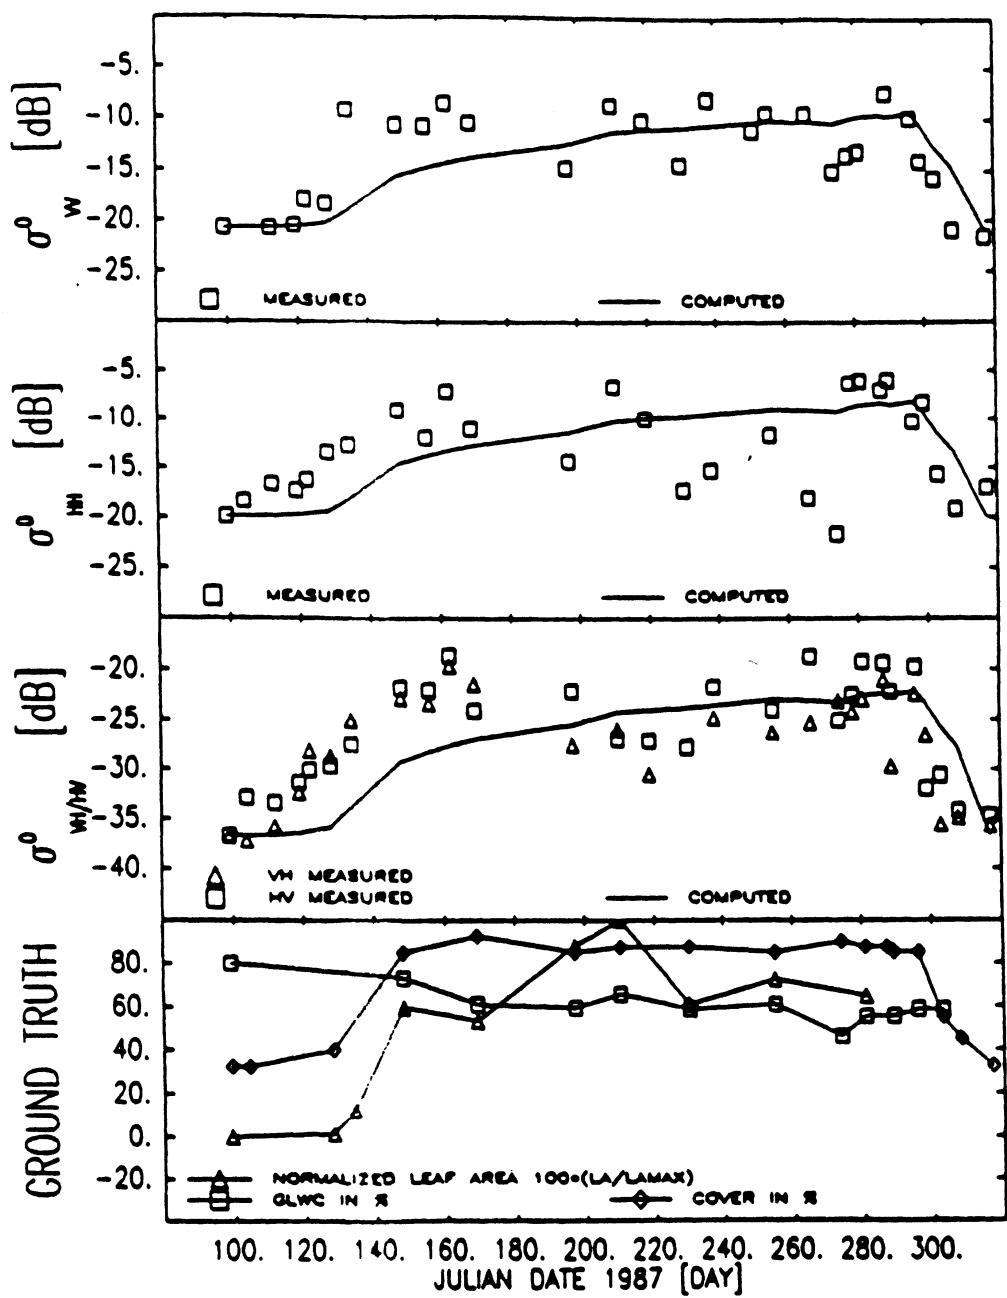

Curves showing measured and computed  $\sigma^0$  versus Julian date for VV, HH, and VH/HV polarizations for Eastern Cottonwood (E). Also shown is the corresponding measured ground truth data.

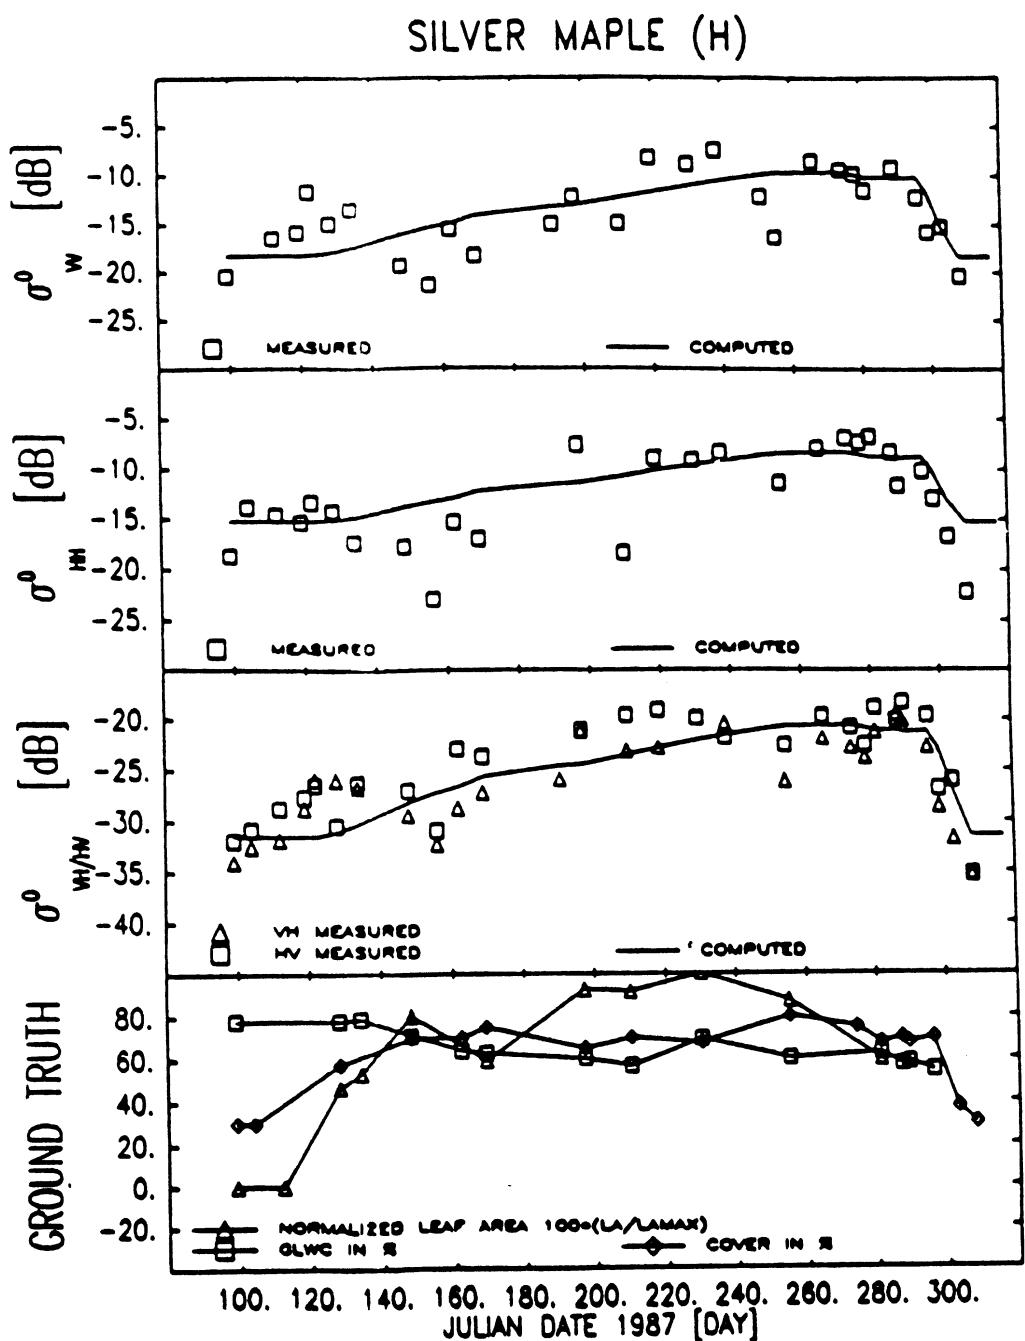

Curves showing measured and computed  $\sigma^0$  versus Julian date for VV, HH, and VH/HV polarizations for Pine Oak (F). Also shown is the corresponding measured ground truth data.

### BLACK OAK (G)

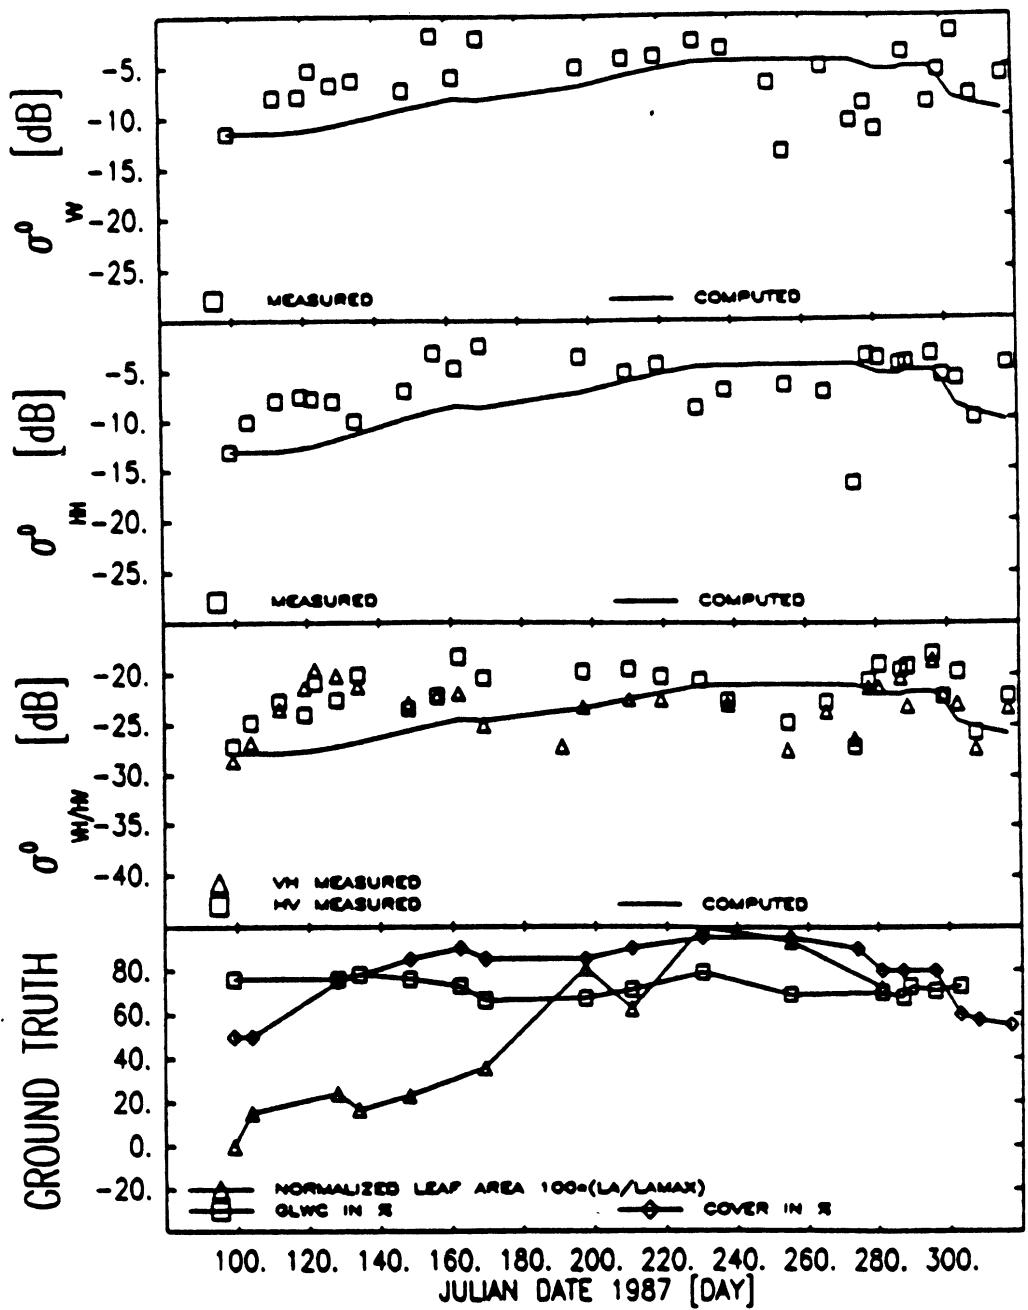

Curves showing measured and computed  $\sigma^0$  versus Julian date for VV, HH, and VH/HV polarizations for Black Oak (G). Also shown is the corresponding measured ground truth data.

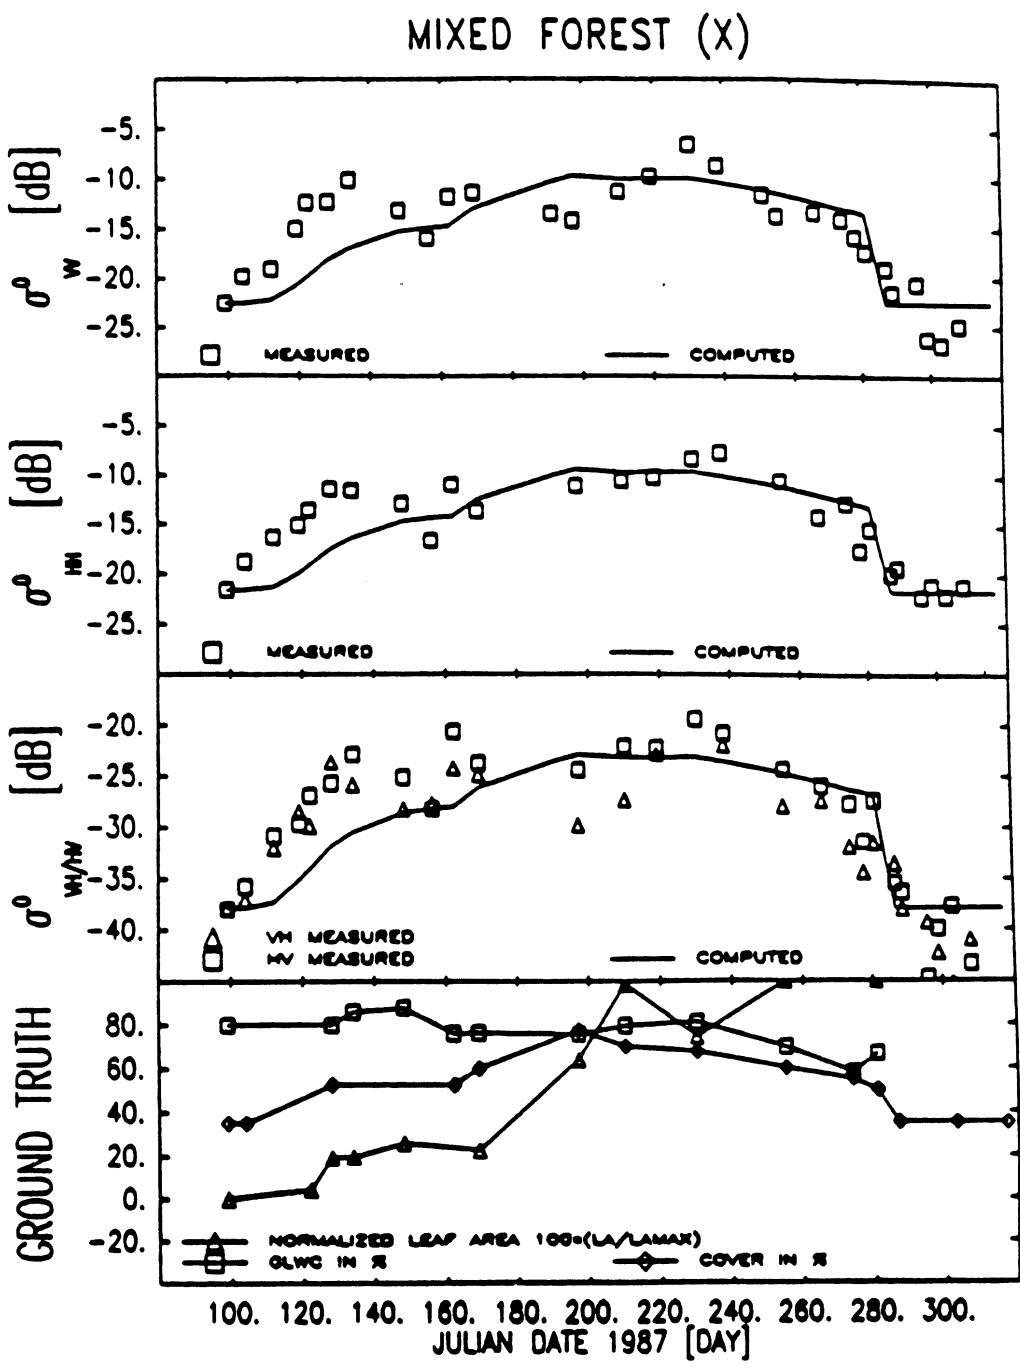

Curves showing measured and computed  $\sigma^0$  versus Julian date for VV, HH, and VH/HV polarizations for Silver Maple (H). Also shown is the corresponding measured ground truth data.

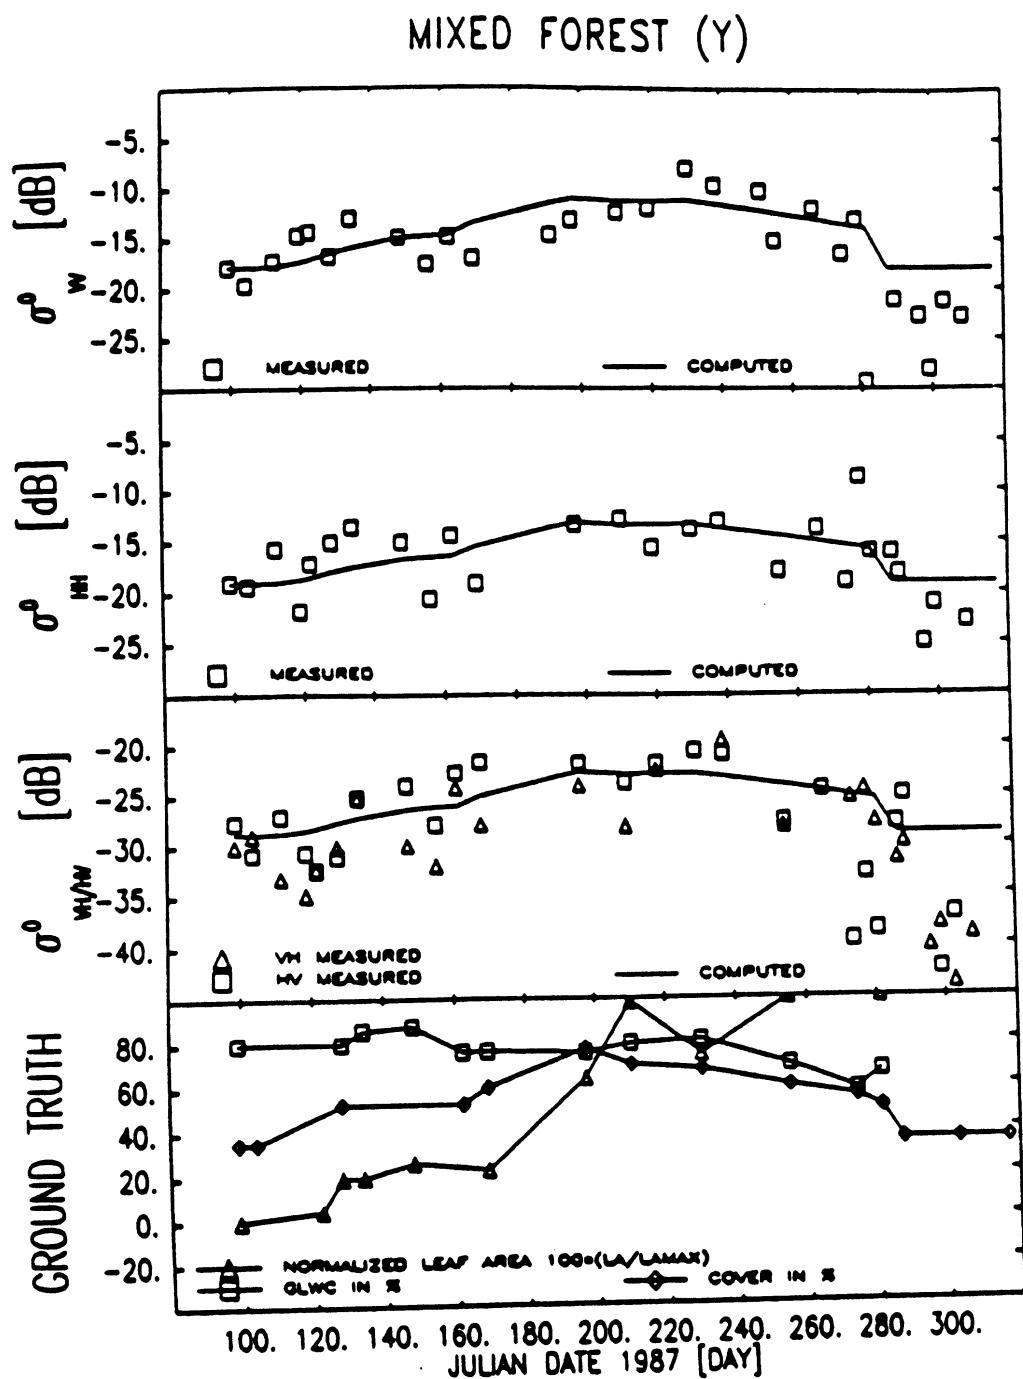

## WEEPING WILLOW (I)

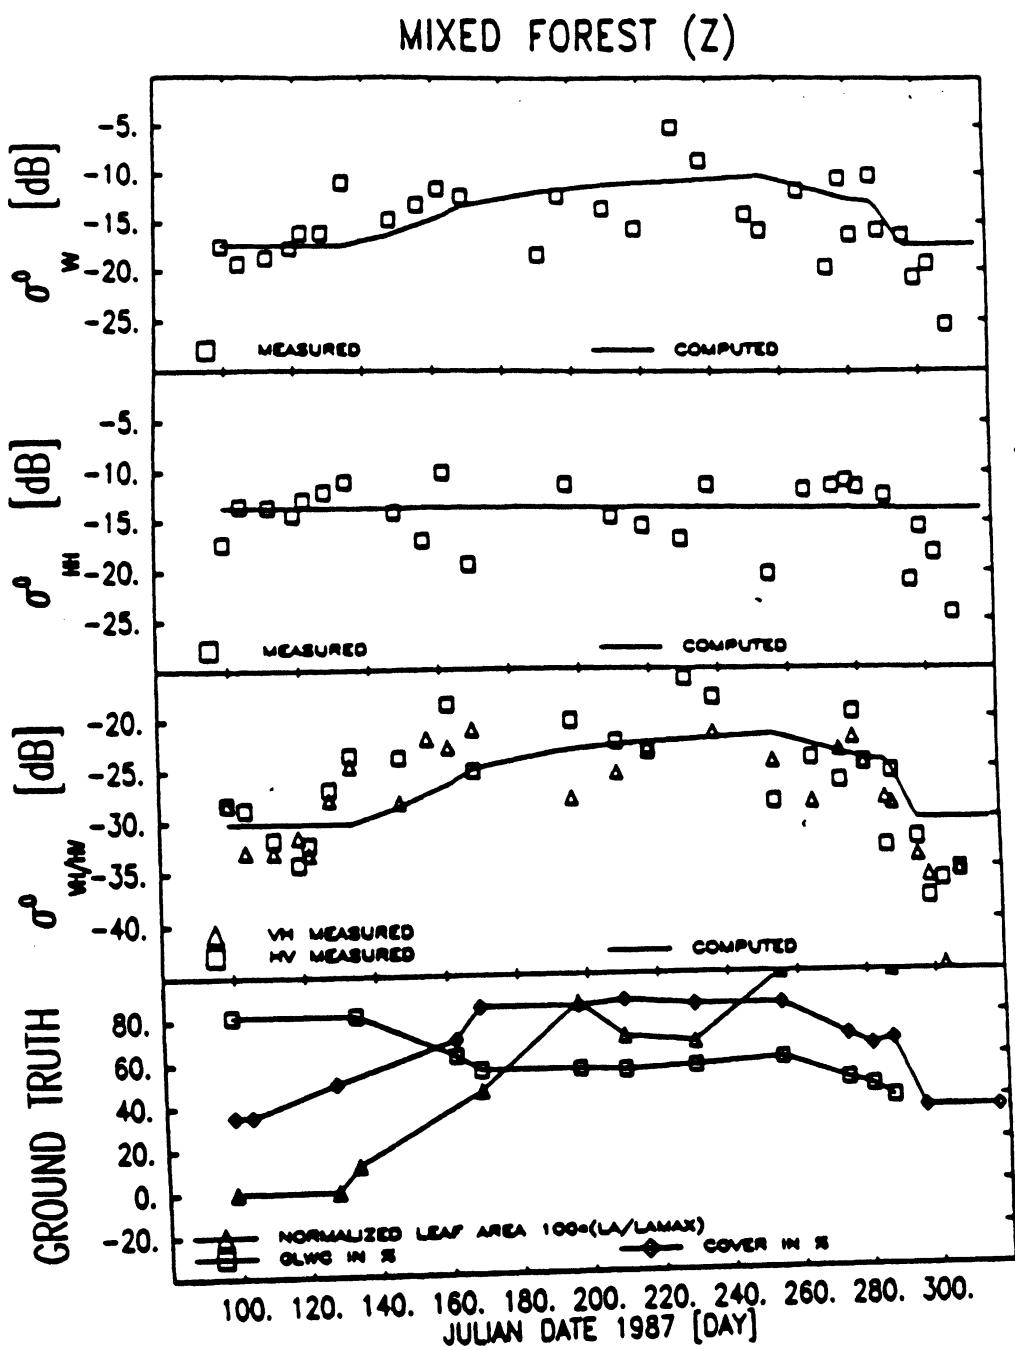

Curves showing measured and computed  $\sigma^0$  versus Julian date for VV, HH, and VH/HV polarizations for Weeping Willow (I). Also shown is the corresponding measured ground truth data.

Curves showing measured and computed  $\sigma^0$  versus Julian date for VV, HH, and VH/HV polarizations for Mixed Forest (X). Also shown is the corresponding measured ground truth data.

Curves showing measured and computed  $\sigma^0$  versus Julian date for VV, HH, and VH/HV polarizations for Mixed Forest (Y). Also shown is the corresponding measured ground truth data.

Curves showing measured and computed  $\sigma^0$  versus Julian date for VV, HH, and VH/HV polarizations for Mixed Forest (Z). Also shown is the corresponding measured ground truth data.

## 10. 215-GHZ DATA FOR SNOW

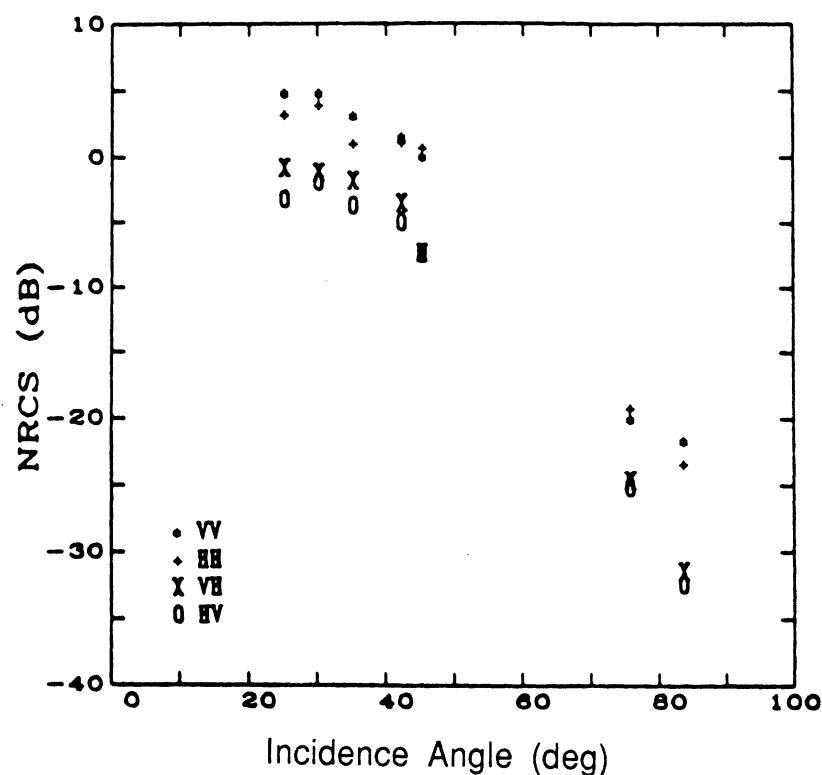

The snow observations, which were made from the same tower platform, included measurements at various incidence angles extending from 25° to 83.2°, corresponding to ground areas for which the radar had an unobstructed view. Table II-2 provides a summary of the ground truth observations that were recorded in support of the radar measurements.

TABLE II-2

GROUND TRUTH FOR SNOW DATA SHOWN IN FIG. 3

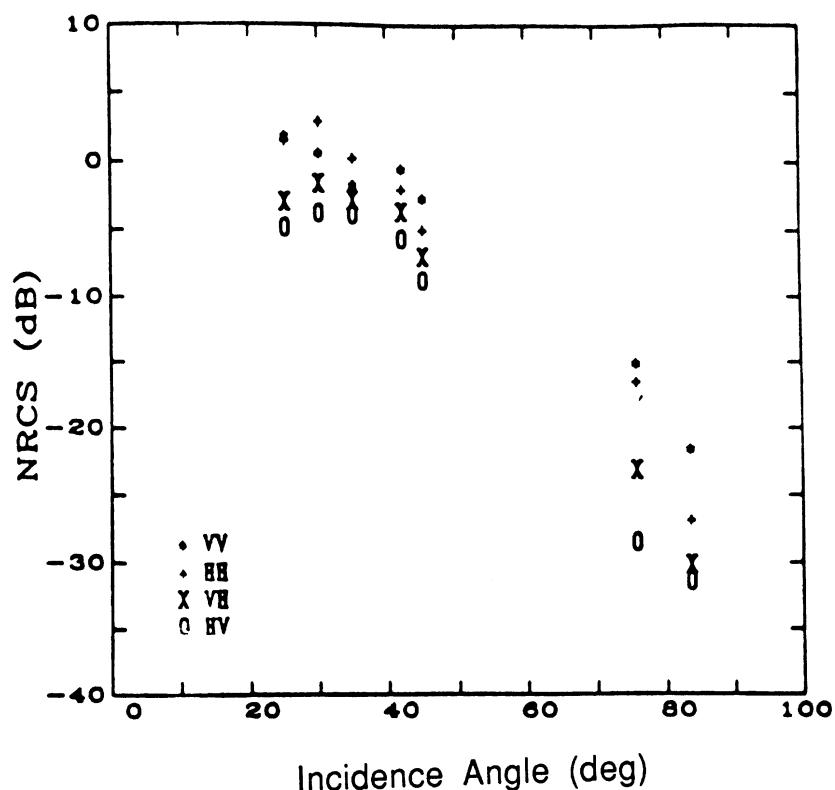

| Day #<br>(Fig. Ref.)  | RMS Surface<br>Roughness (mm) | No. of<br>Layers | Layer #                             | Particle Size (mm)<br>Minimum Maximum |               | Temperature<br>(°C) | Density<br>(gm/cc)      | Volumetric<br>Moisture (%) | Layer<br>Thickness (mm) |

SNOW AT 215 GHz: DAY 09

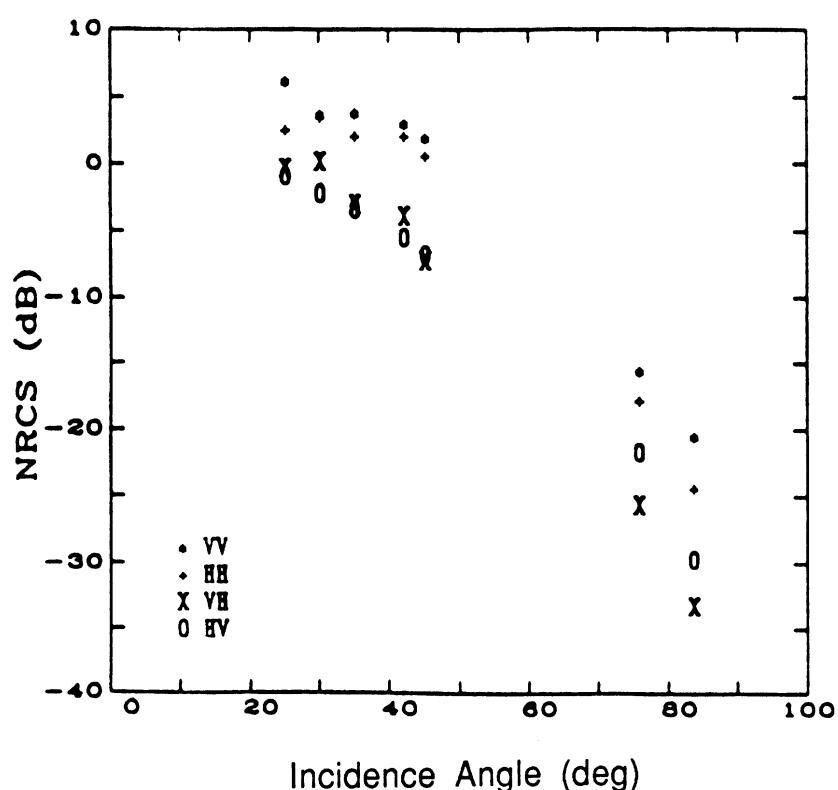

Measured value of  $\sigma_{VV}^0$  (\*),  $\sigma_{HH}^0$  (+),  $\sigma_{VH}^0$  (X), and  $\sigma_{HV}^0$  (O) of snow at 215 GHz

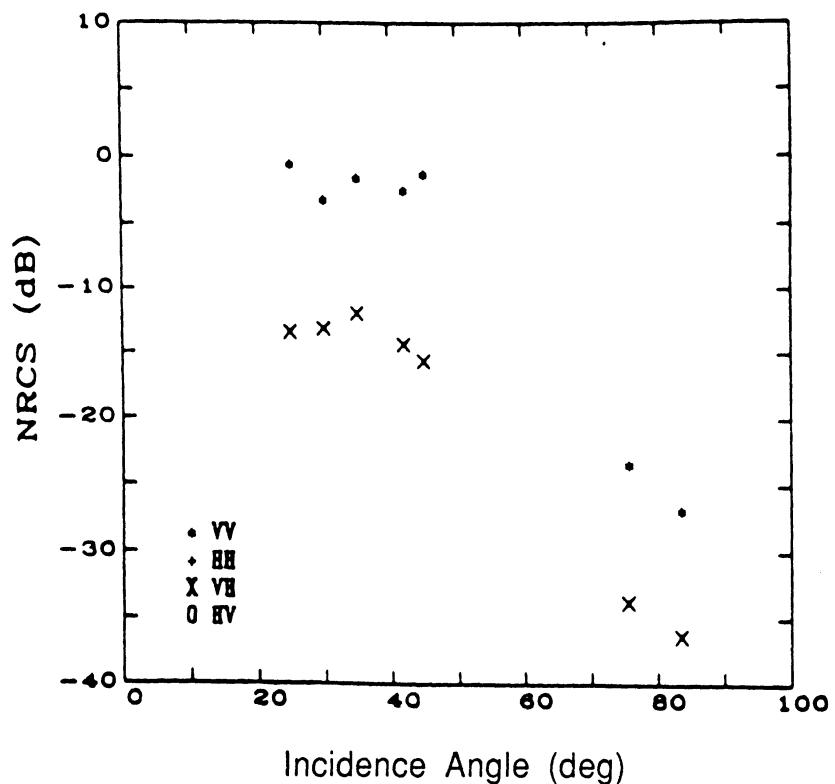

SNOW AT 215 GHz: DAY 11

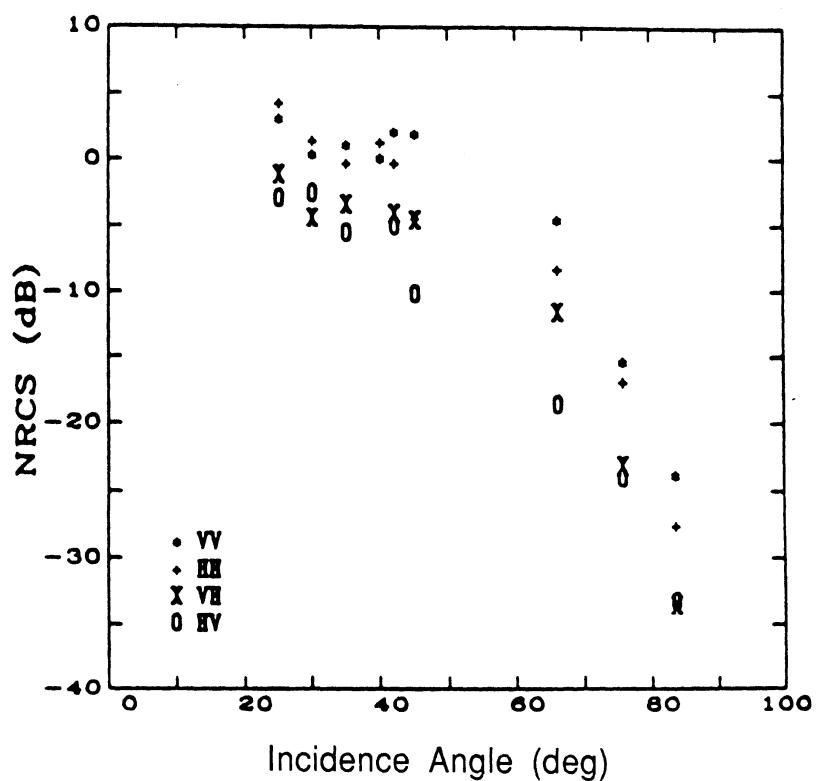

SNOW AT 215 GHz: DAY 10

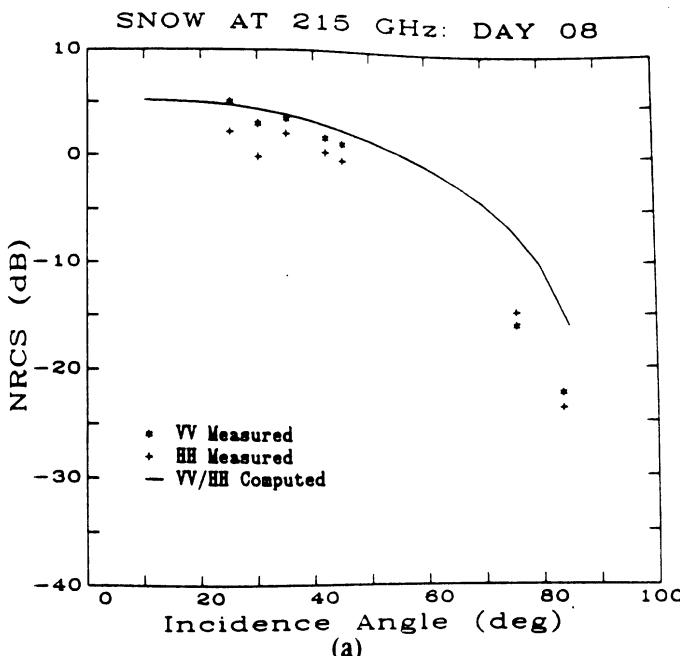

SNOW AT 215 GHz: DAY 12

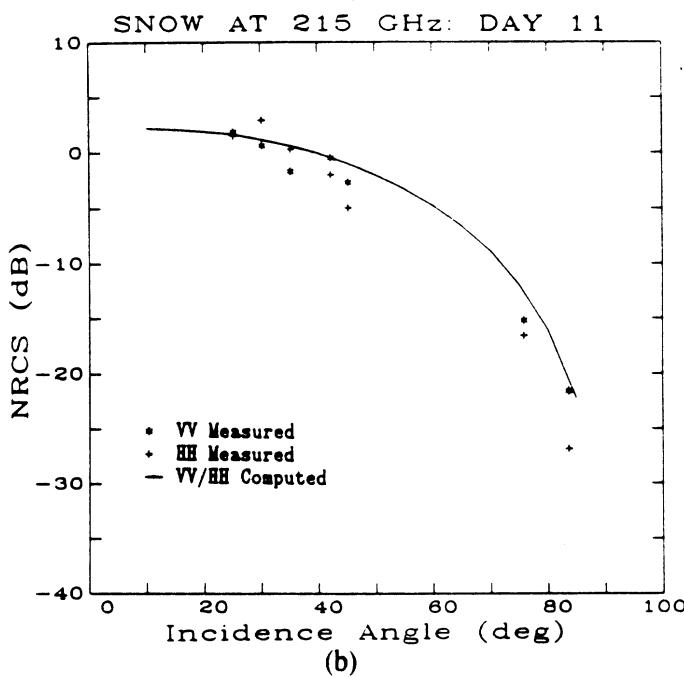

SNOW AT 215 GHz: DAY 14

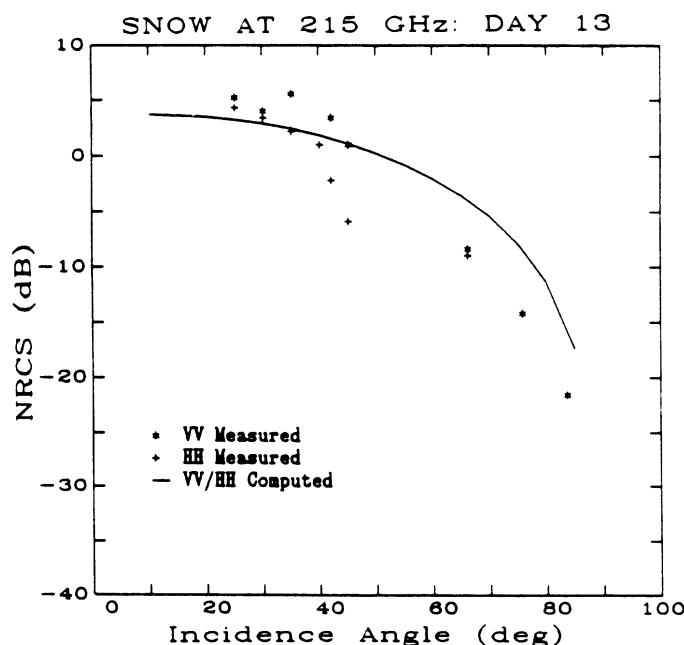

(a)

(b)

(c)

Measured (\*:  $\sigma_{VV}^o$ , +:  $\sigma_{HH}^o$ ) and computed (—) values of co-polarized backscatter for (a) Day 8, (b) Day 11, (c) Day 13.

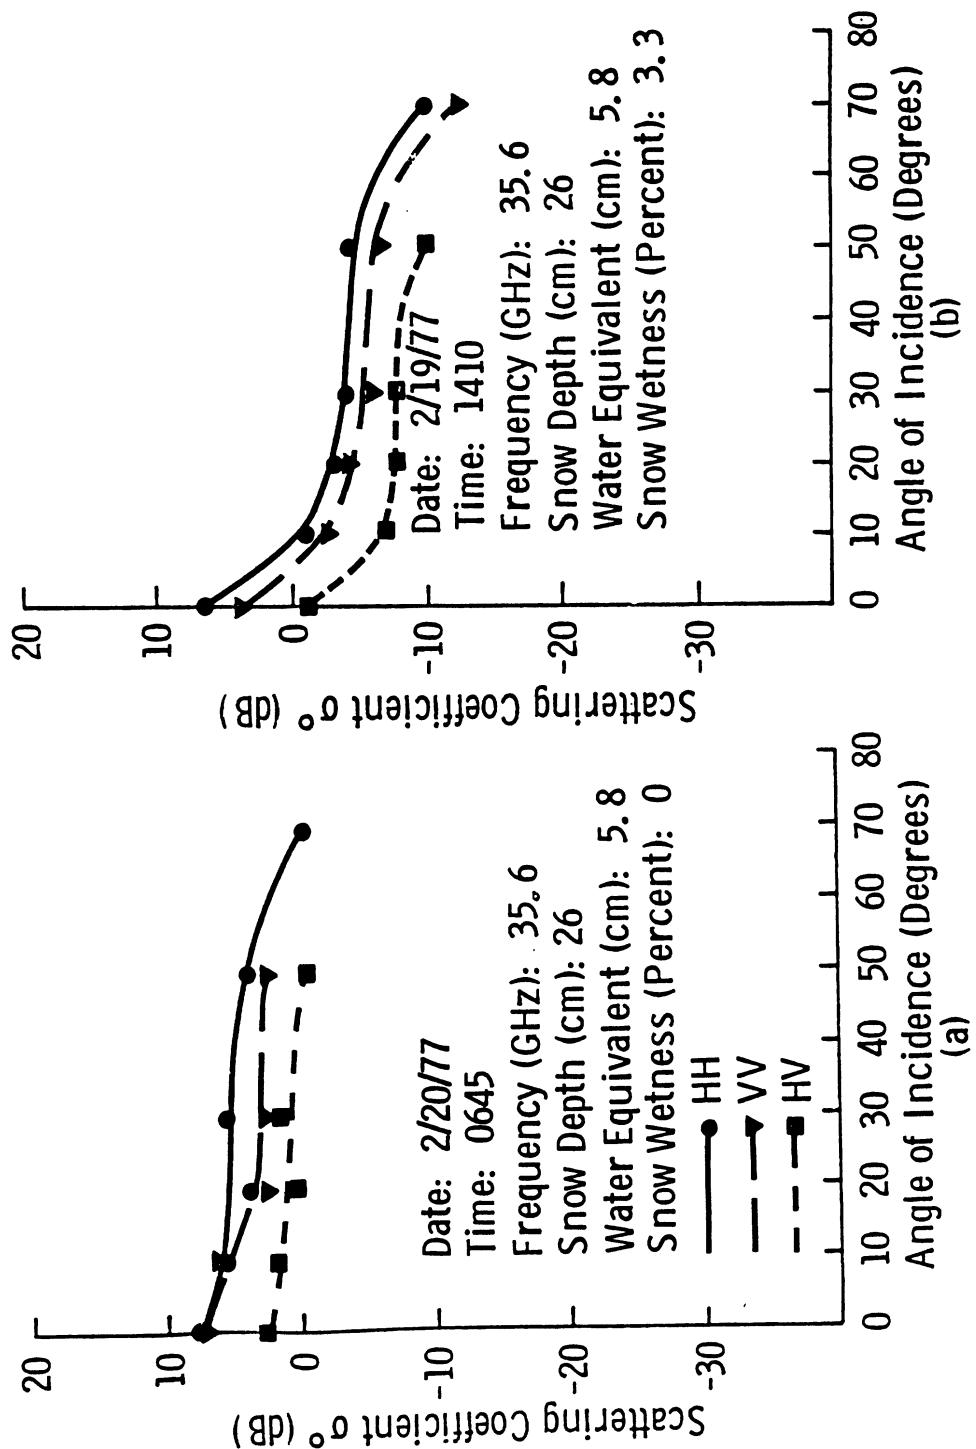

### PART III. UNIVERSITY OF KANSAS DATA

The University of Kansas program used a 20-m high truck-mounted platform, similar to that used by the University of Michigan, to make multipolarization radar backscatter measurements at 35 GHz for various types of terrain surfaces. The majority of the data were recorded for HH, HV, VH, and VV linear polarization combinations, although a few were made for circular polarization configurations (RL, LL, LR, RR) also.

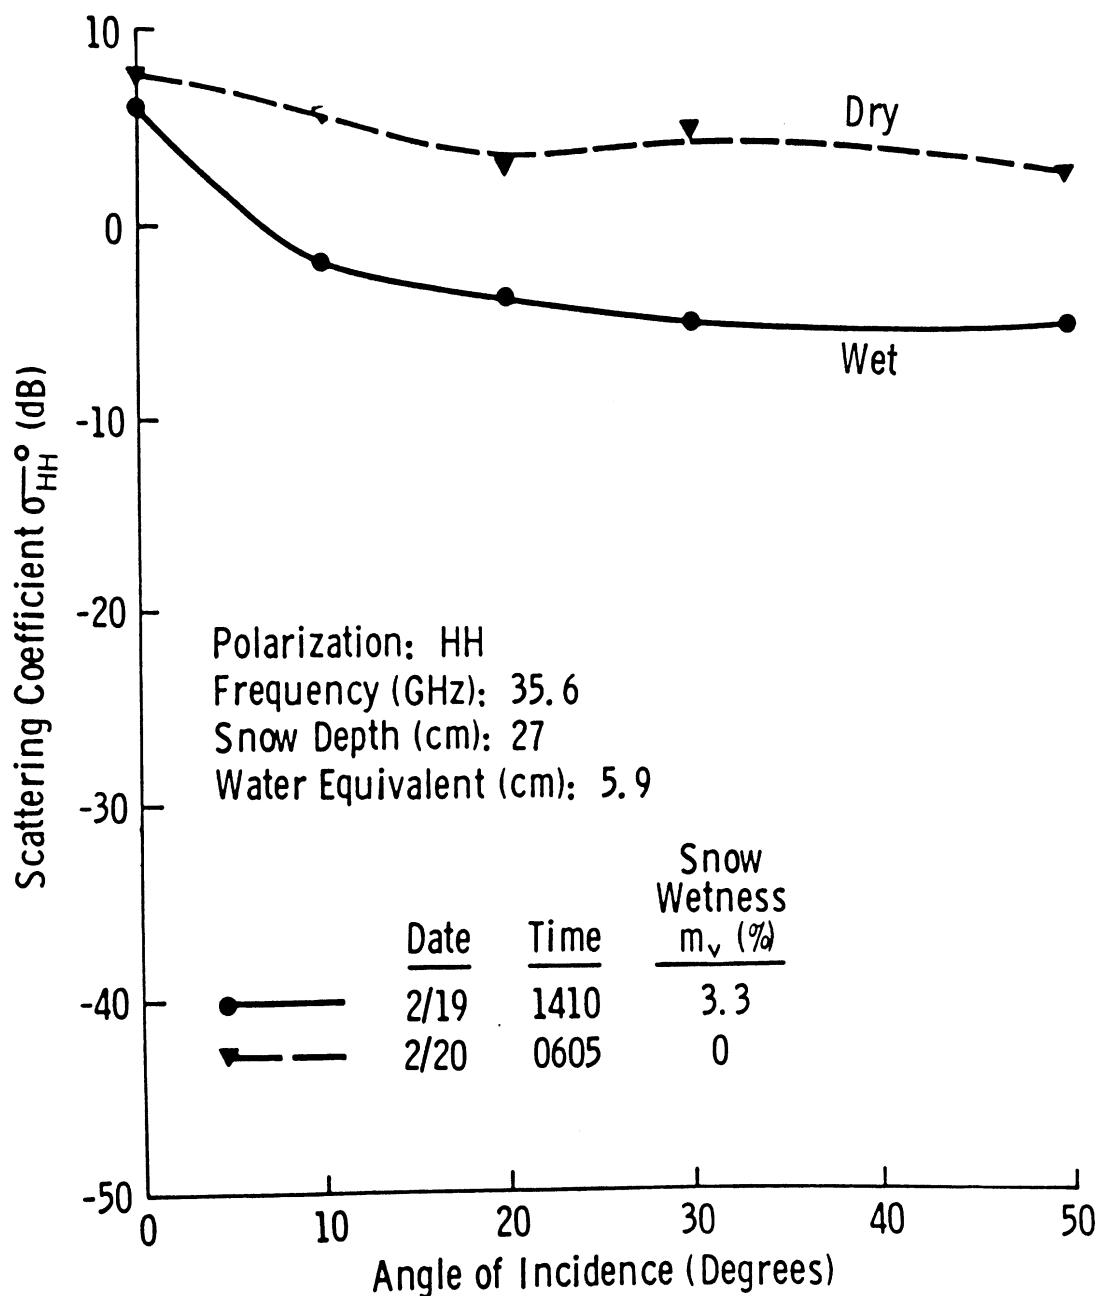

The radar used was an FM-CW system with separate transmit and receiver antennas. The antennas were equipped with polarizers and had a beam width of 3° each, resulting in a product beam width of about 2°.

The data reported in this part of the Handbook, which was extracted from reference [17]-[20], is divided into three categories: (1) angular plots of  $\sigma^0$  for snow-covered ground under both dry and wet conditions, (2) diurnal plots of  $\sigma^0$  as a function of time for snow, and (3) angular plots for various types of road surfaces with and without snow cover.

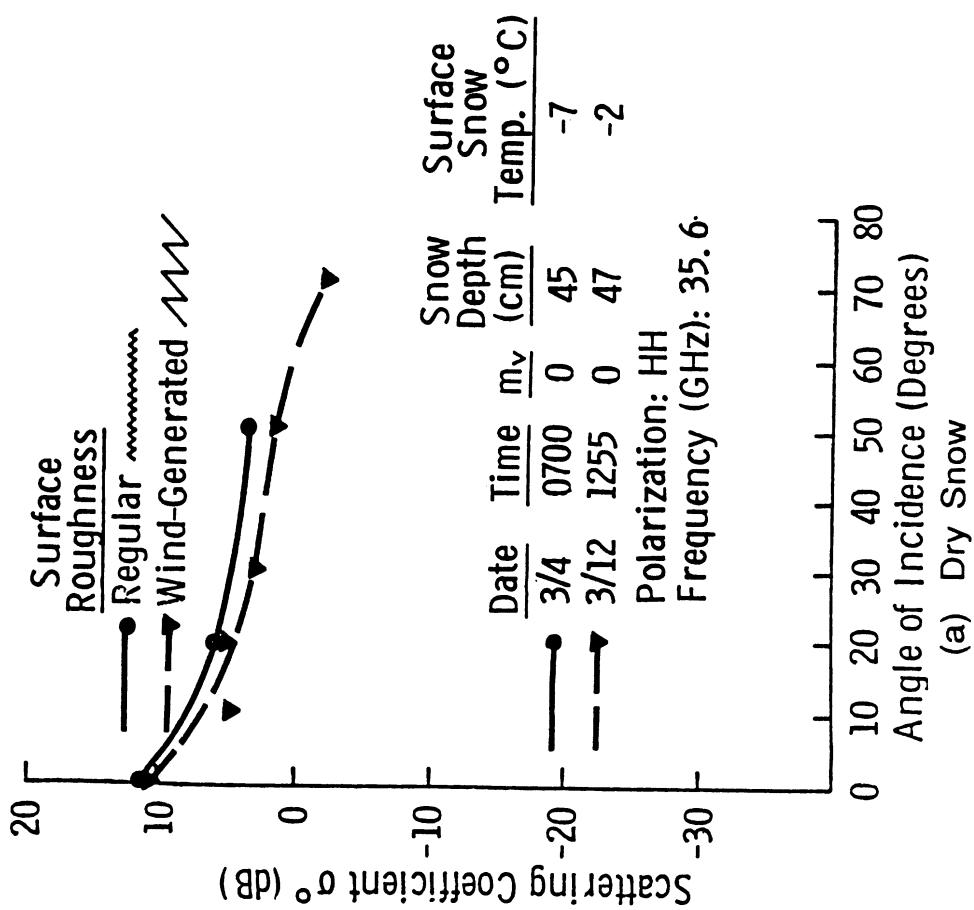

## 11. 35 GHz DATA FOR SNOW

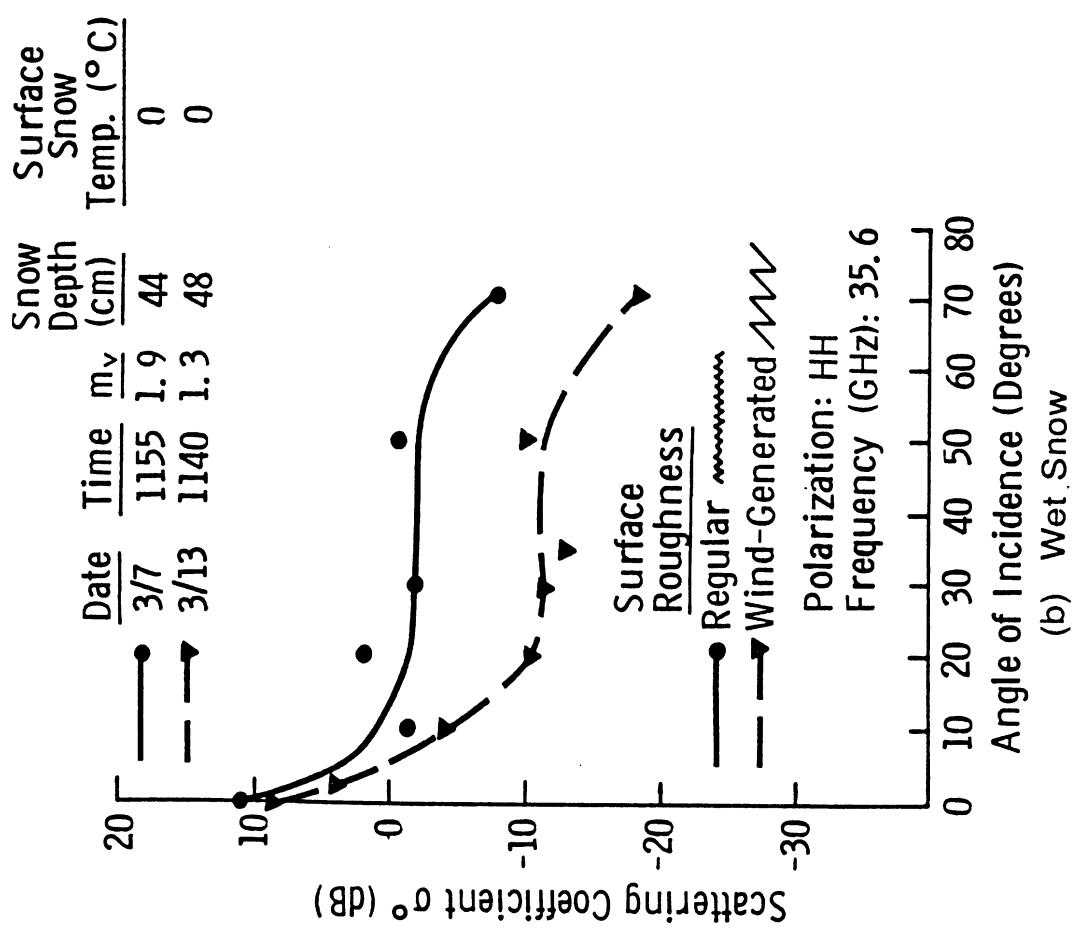

Polarization and angular response of  $\sigma_0$  for (a) dry snow condition and  
(b) wet snow condition.

Angular Response of  $\sigma^0$  at 35.6 GHz to Wet and Dry Snow

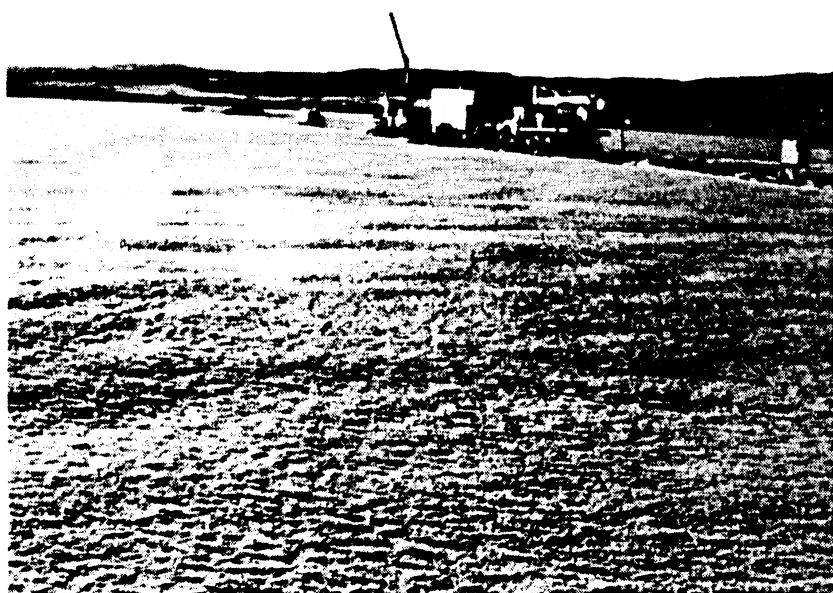

(a) Dry Snow

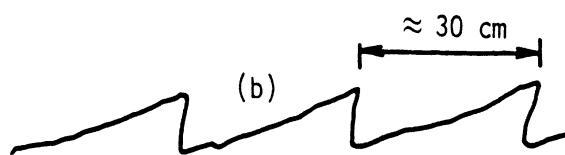

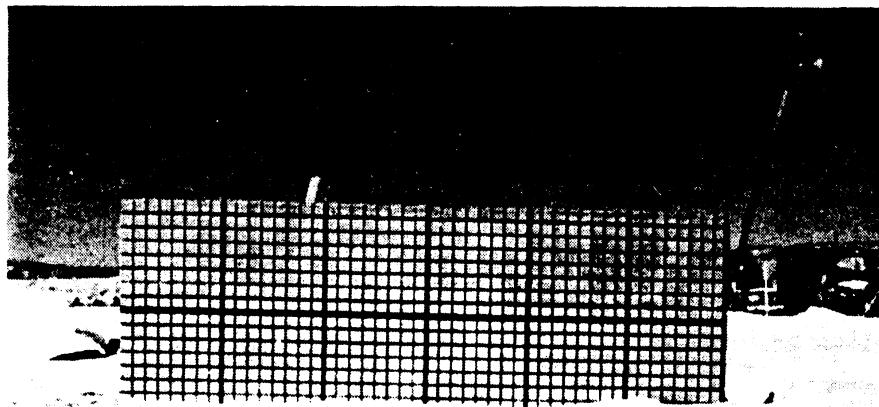

(b) Wet Snow

Effect of surface roughness for (a) dry snow and (b) wet snow. ( $m_v$  is volumetric liquid water content of 5-cm surface layer). Photographs of surfaces are shown on the following page.

(a)   $\frac{\Delta}{\lambda} \approx 0.5$  cm

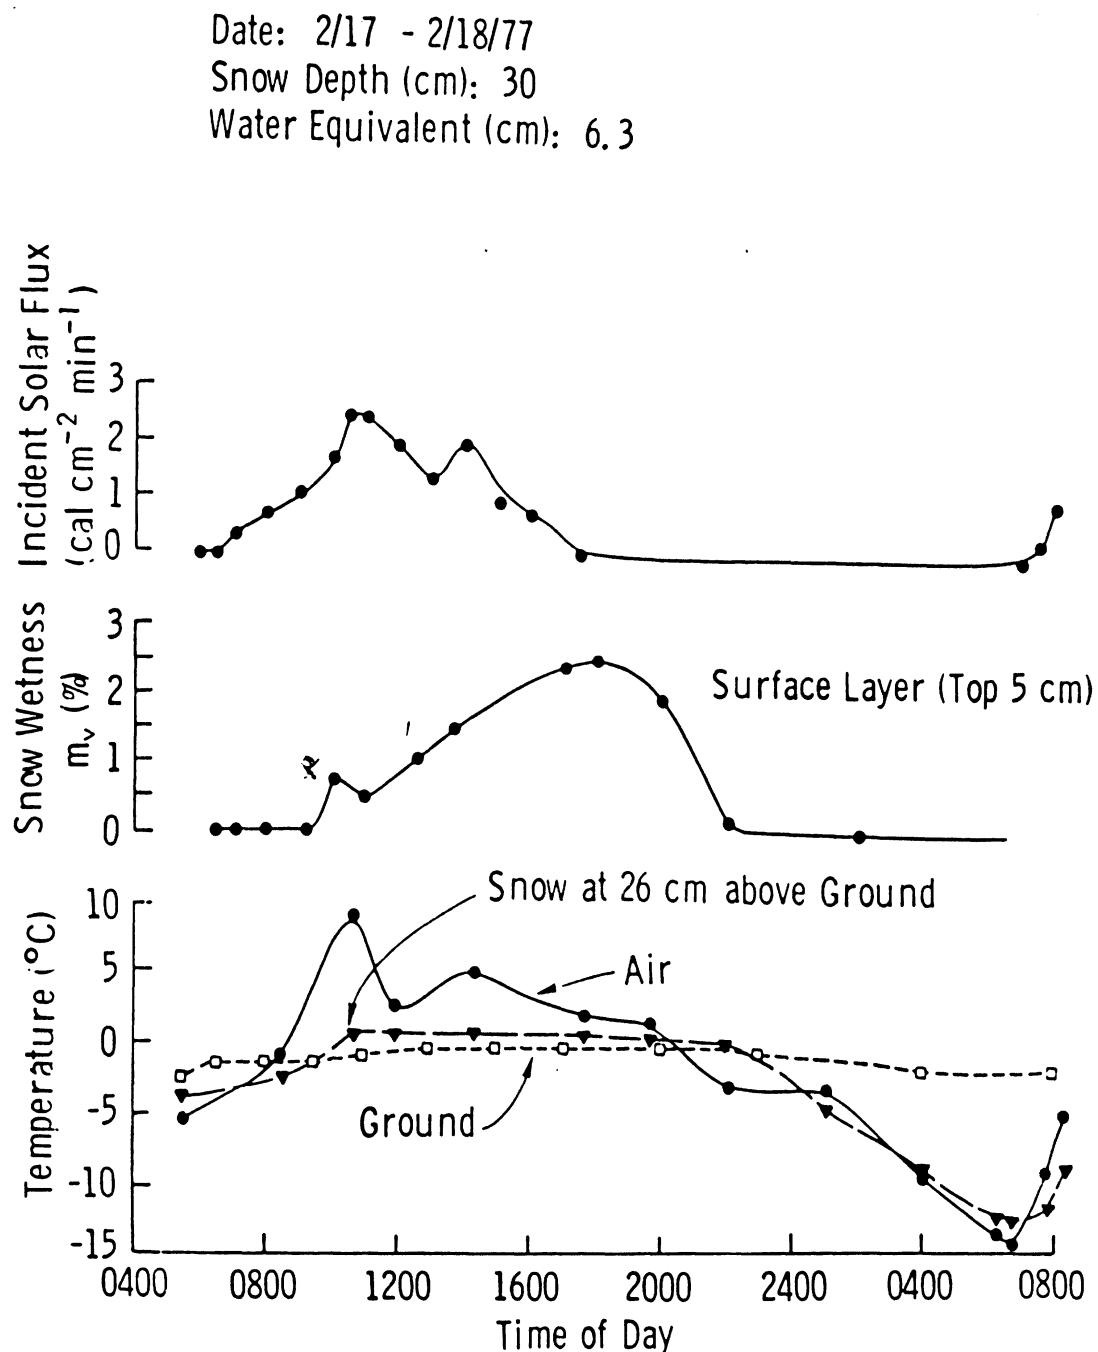

(b)   $\approx 30$  cm  $\approx 2$  cm

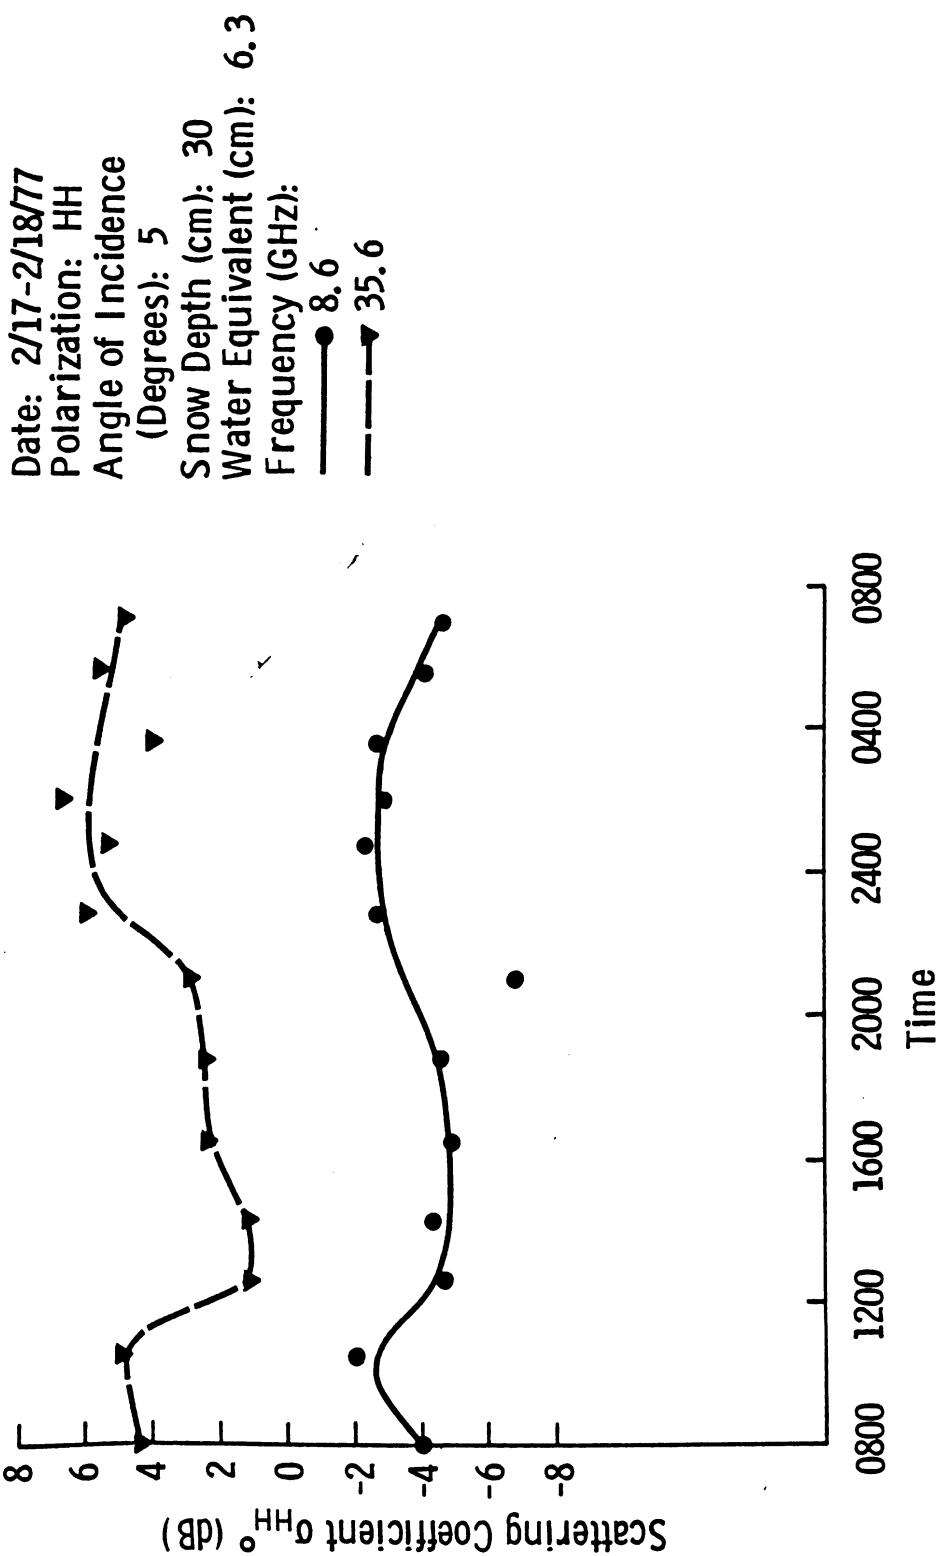

Snow surface structure: (a) regular snow surface, (b) wind-generated snow surface

## 12. 35 GHz DIURNAL DATA FOR SNOW

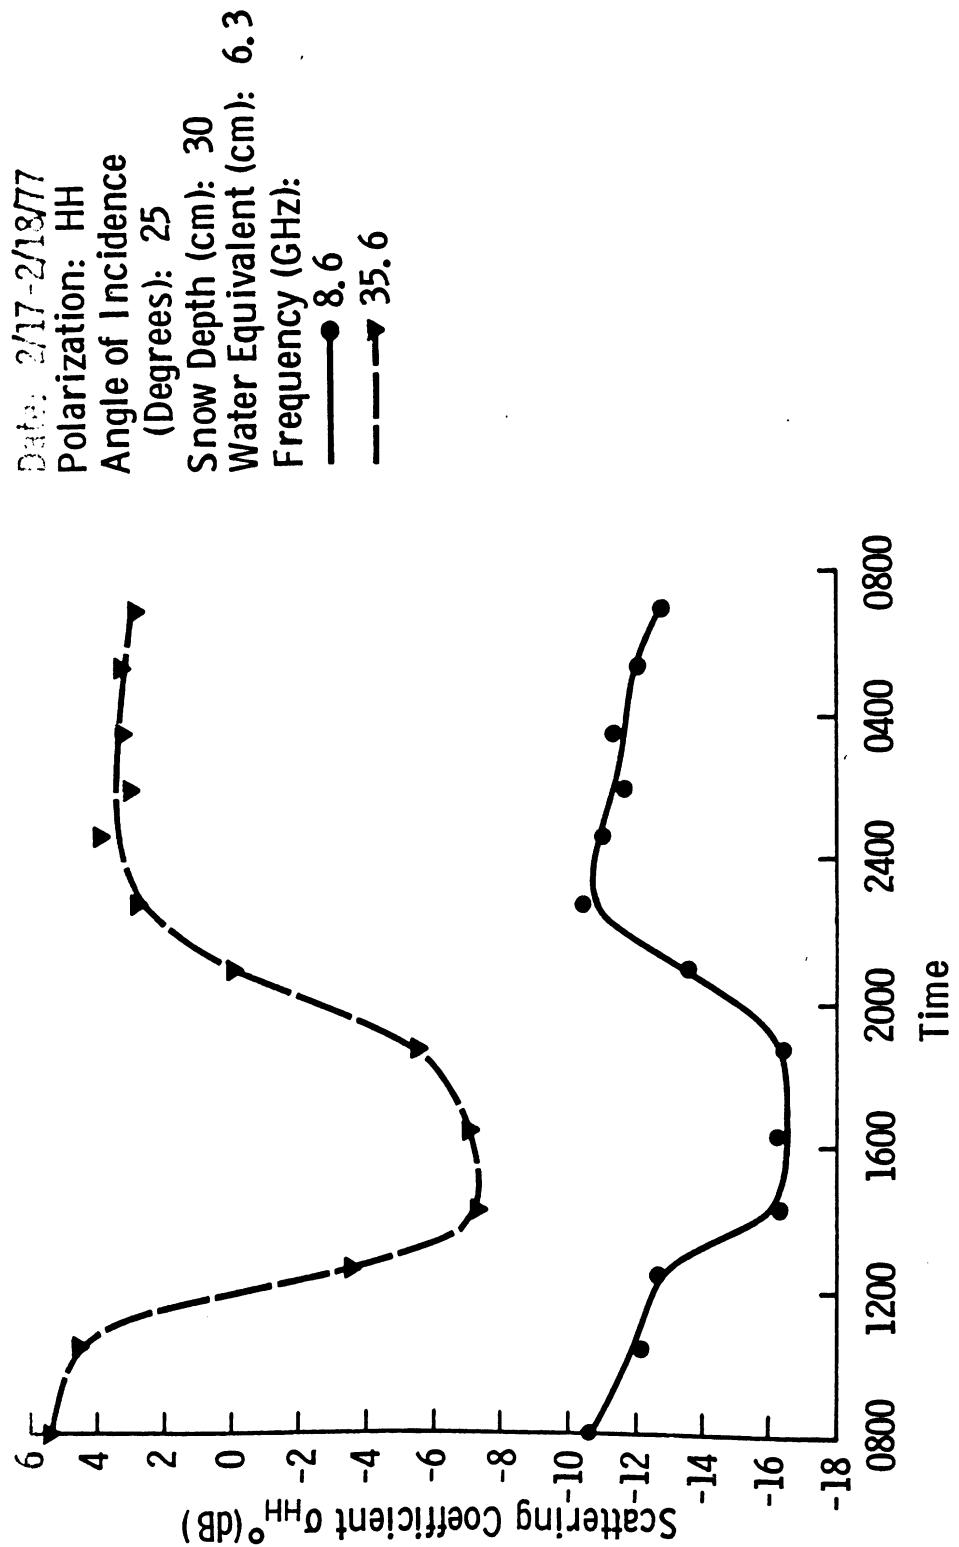

### A. February 17-18, 1977 Diurnal

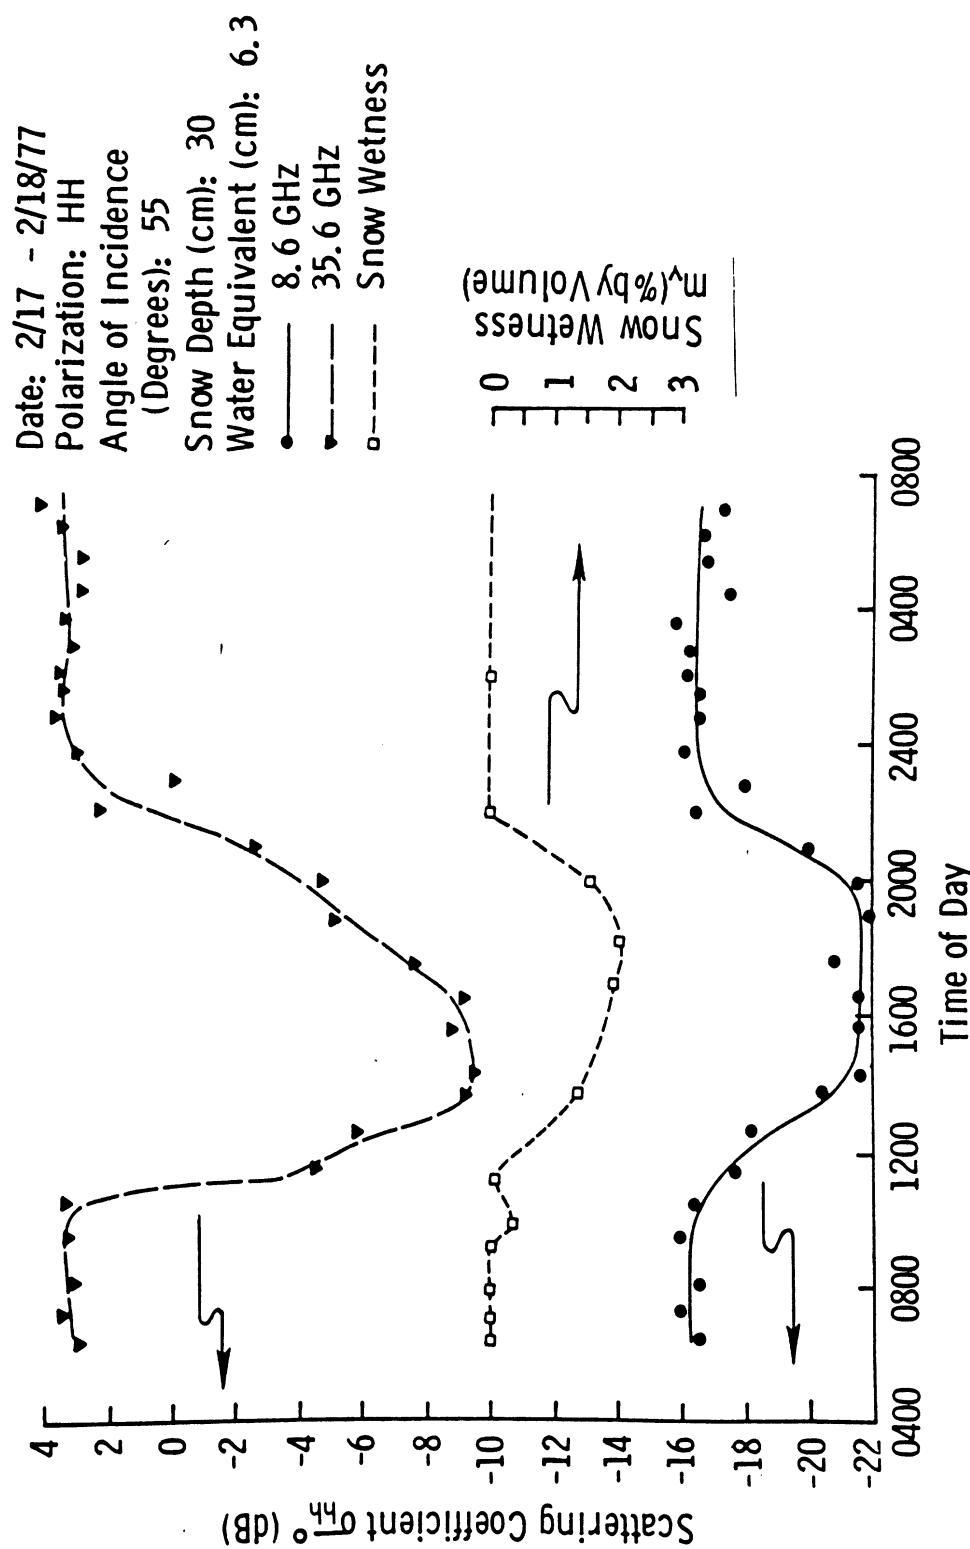

Diurnal variation of the supportive ground truth data on 2/17 - 2/18/77.  $m_v$  is the volumetric snow wetness of the top 5-cm layer.

Diurnal variation of  $\sigma^0$  at 8.6 and 35.6 GHz at  $5^\circ$  angle of incidence.

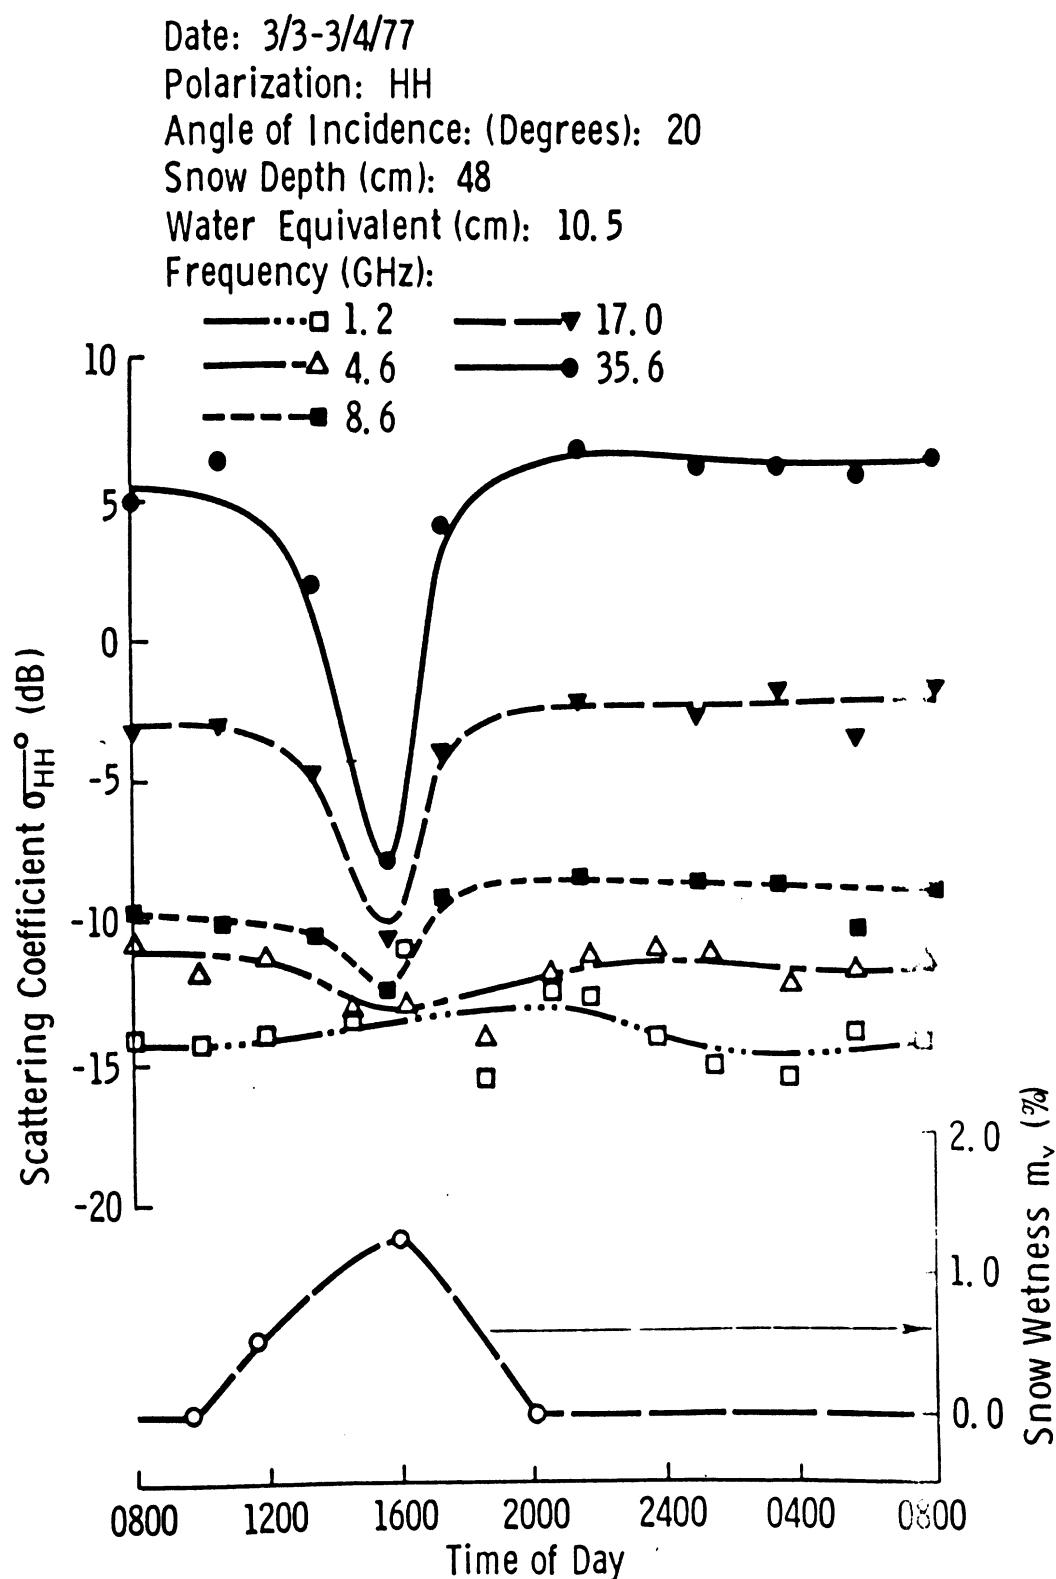

Diurnal variation of  $\sigma_0$  at 8.6 and 35.6 GHz at  $25^\circ$  angle of incidence.

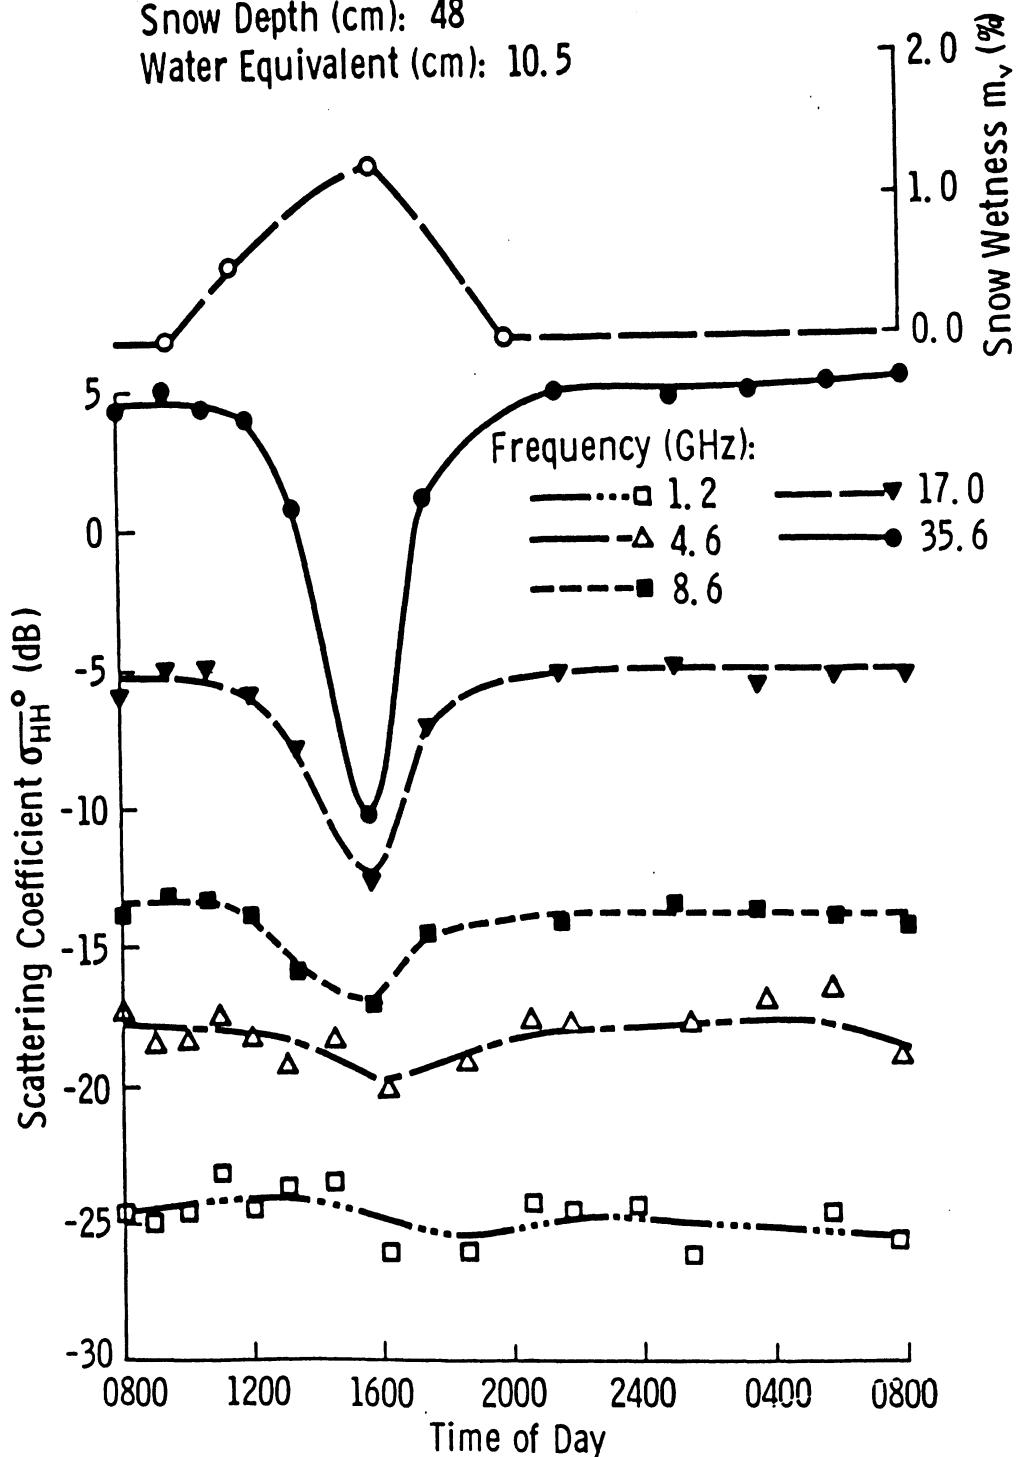

Diurnal variation snow wetness and  $\sigma_0$  at 8.6 and 35.6 GHz. (Note that snow wetness scale has been reversed for ease of comparison with  $\sigma_0$ .

B. March 3-4, 1977 Diurnal

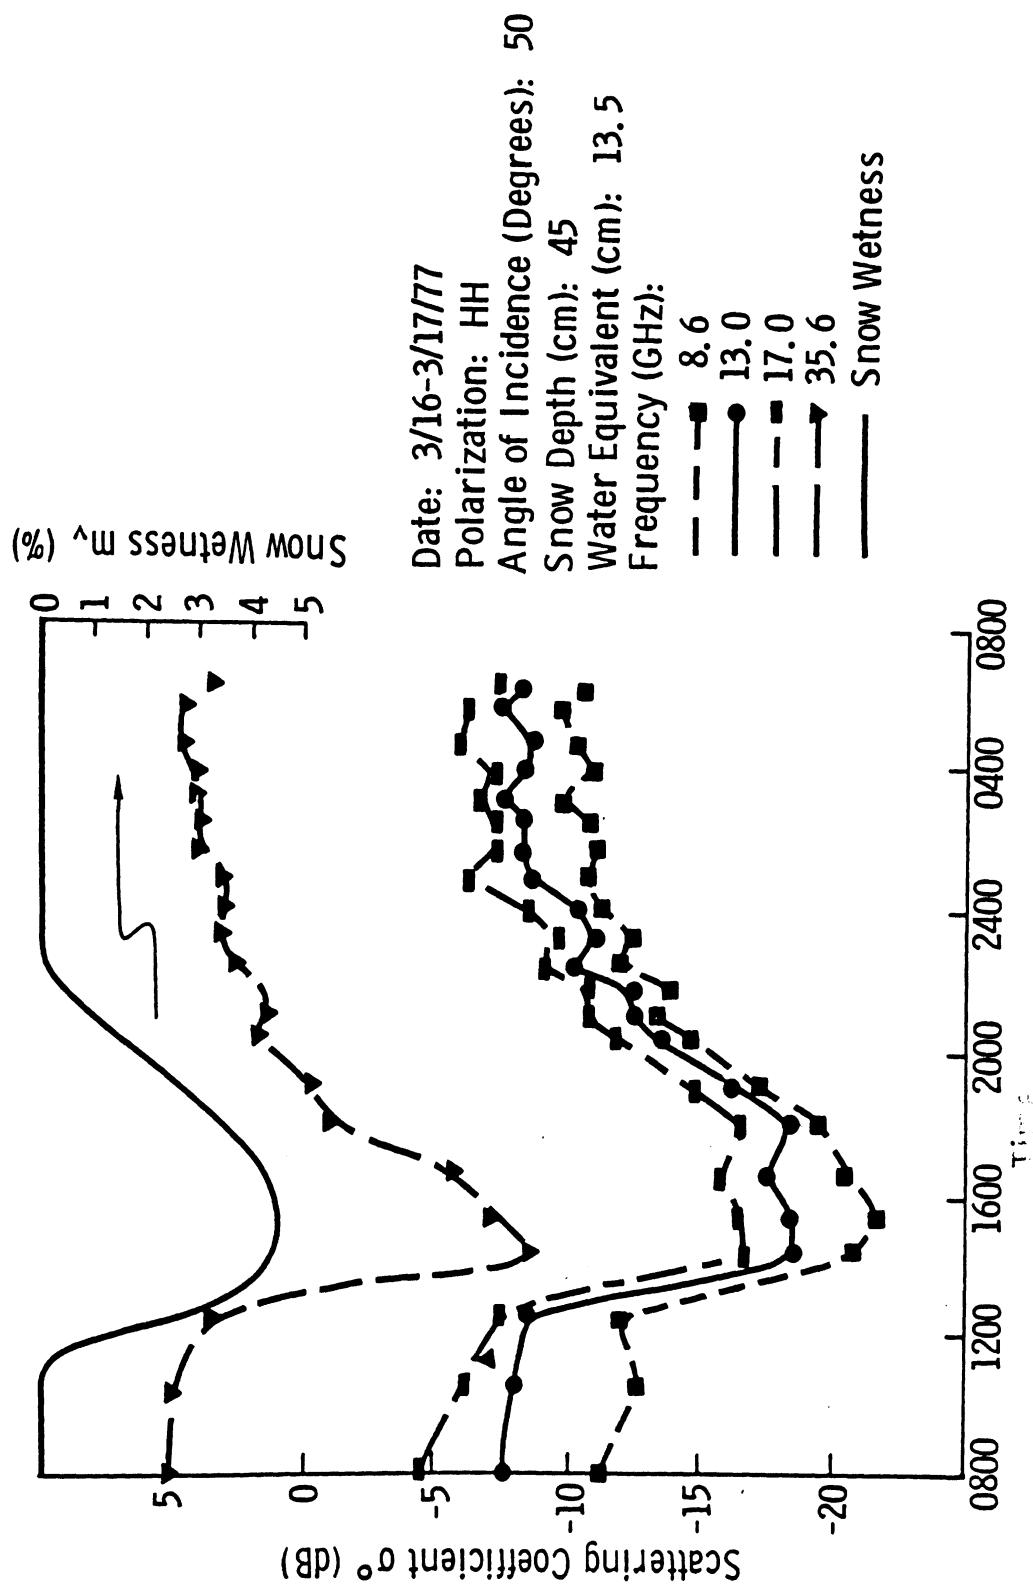

Diurnal Variation of Snow Wetness and  $\sigma^0$  Between 1 and 35 GHz at 20° Angle of Incidence.

Date: 3/3-3/4/77  
 Polarization: HH  
 Angle of Incidence (Degrees): 50  
 Snow Depth (cm): 48  
 Water Equivalent (cm): 10.5

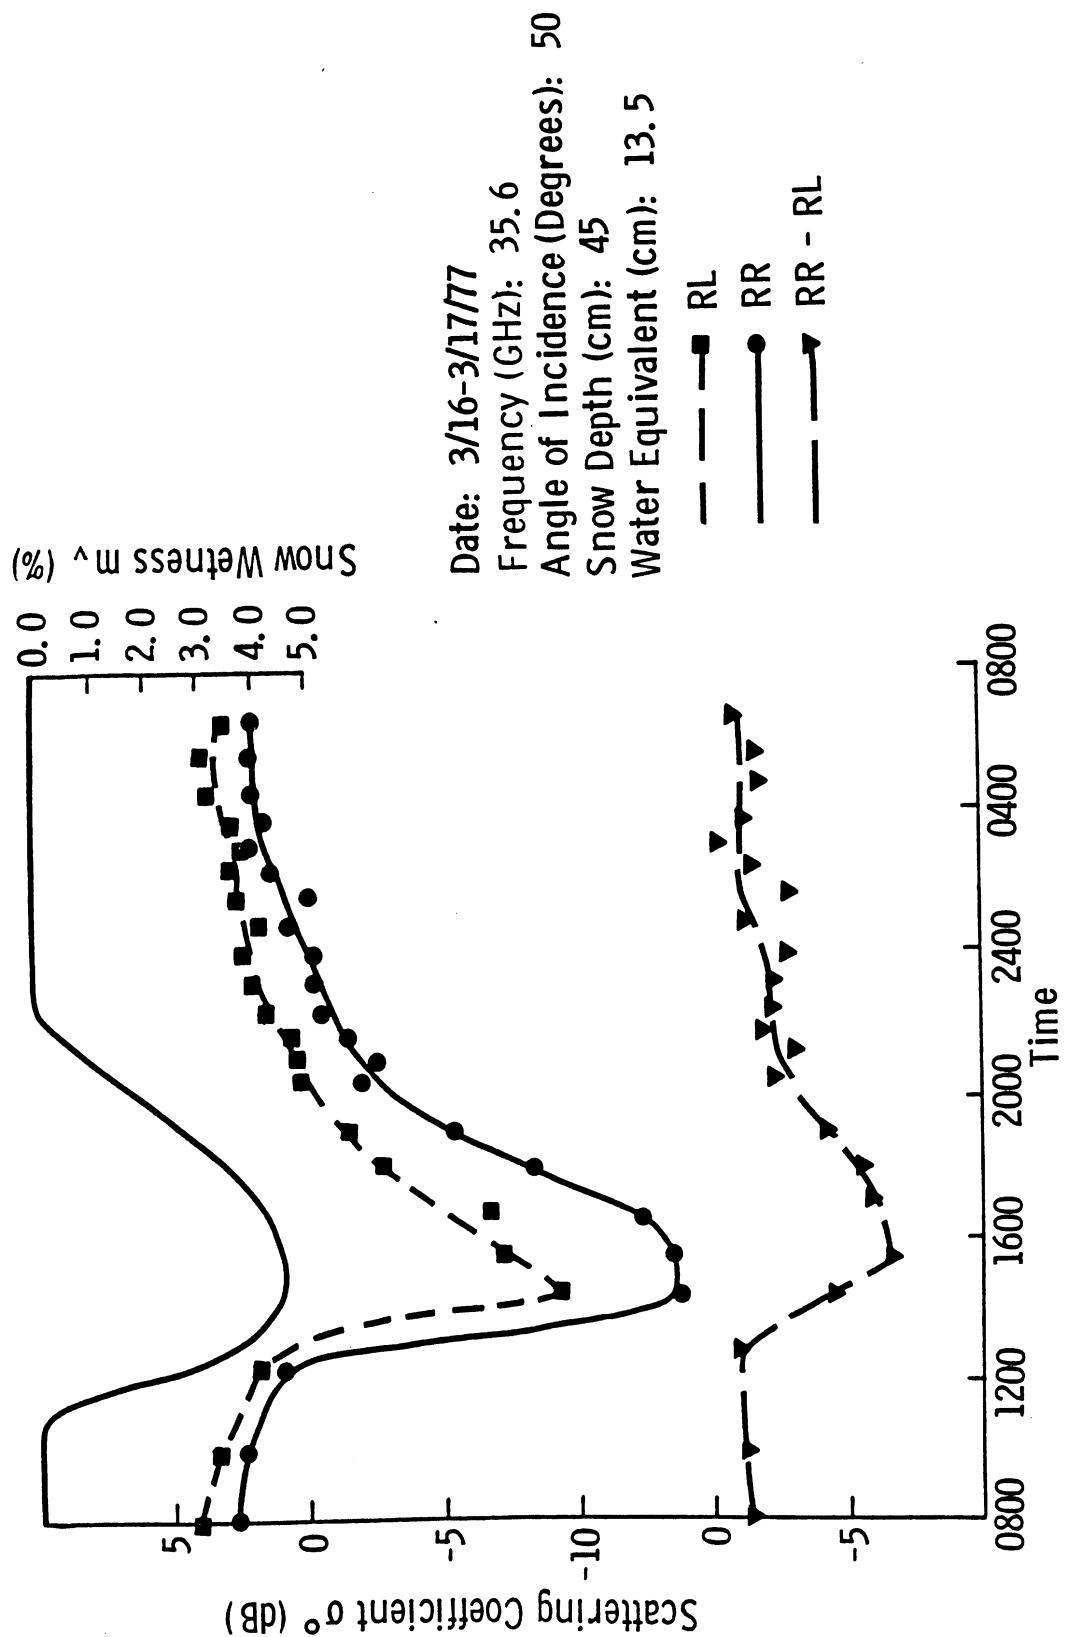

Diurnal Variation of Snow Wetness and  $\sigma^0$  Between 1 and 35 GHz at 20° Angle of Incidence.

C. March 16-17, 1977 Diurnal

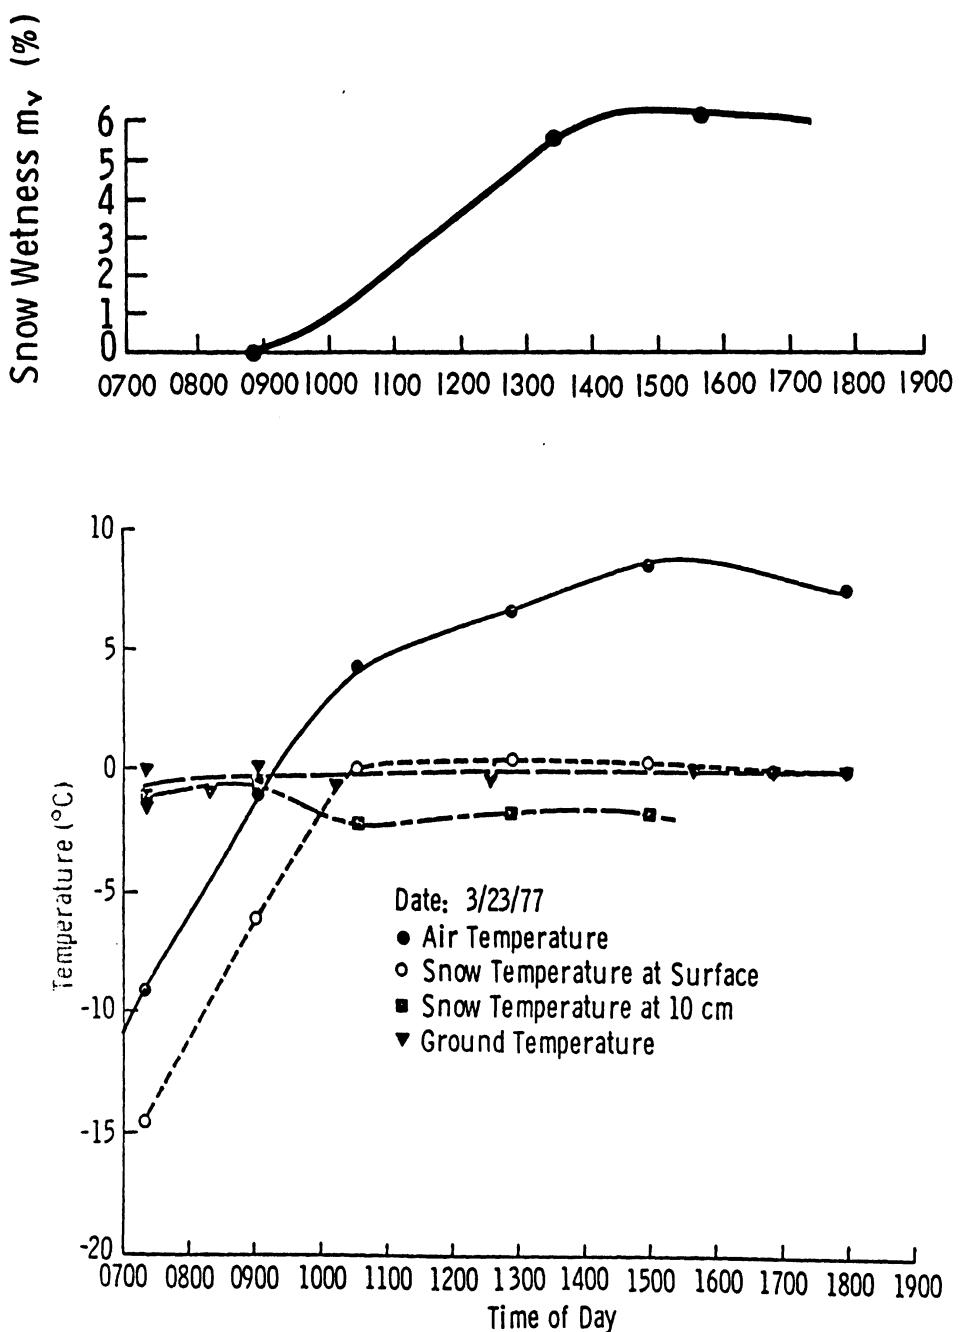

Diurnal variation of snow wetness and  $\sigma^{\circ}$  at 8.6, 13.0, 17.0 and 35.6 GHz at  $50^{\circ}$  angle of incidence.

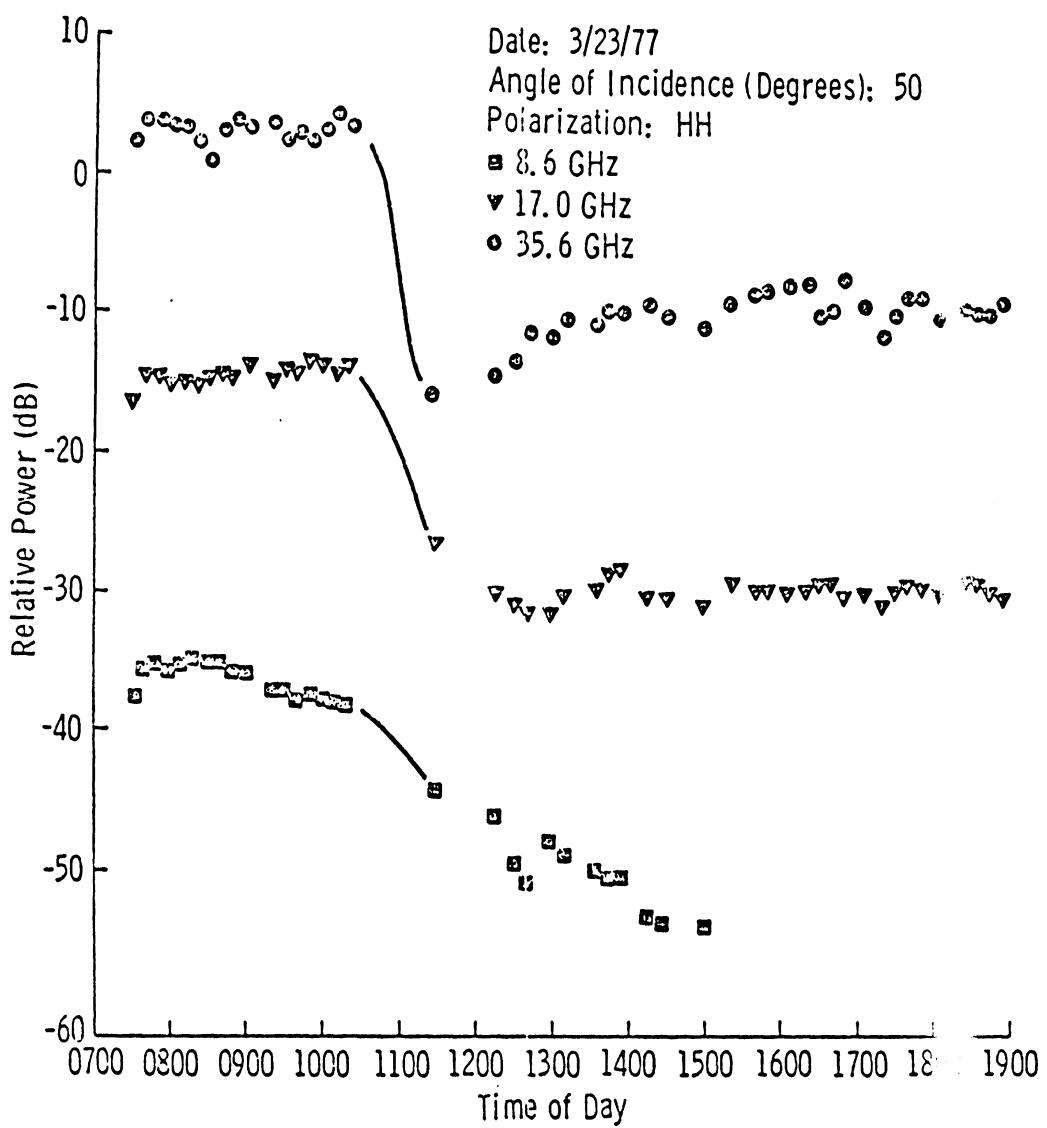

Diurnal variation of snow wetness and the circular polarized  $\sigma^0$  values at 35.6 and the depolarization ratio ( $\sigma_{RR}/\sigma_{RL}$ ) at 50° angle of incidence.

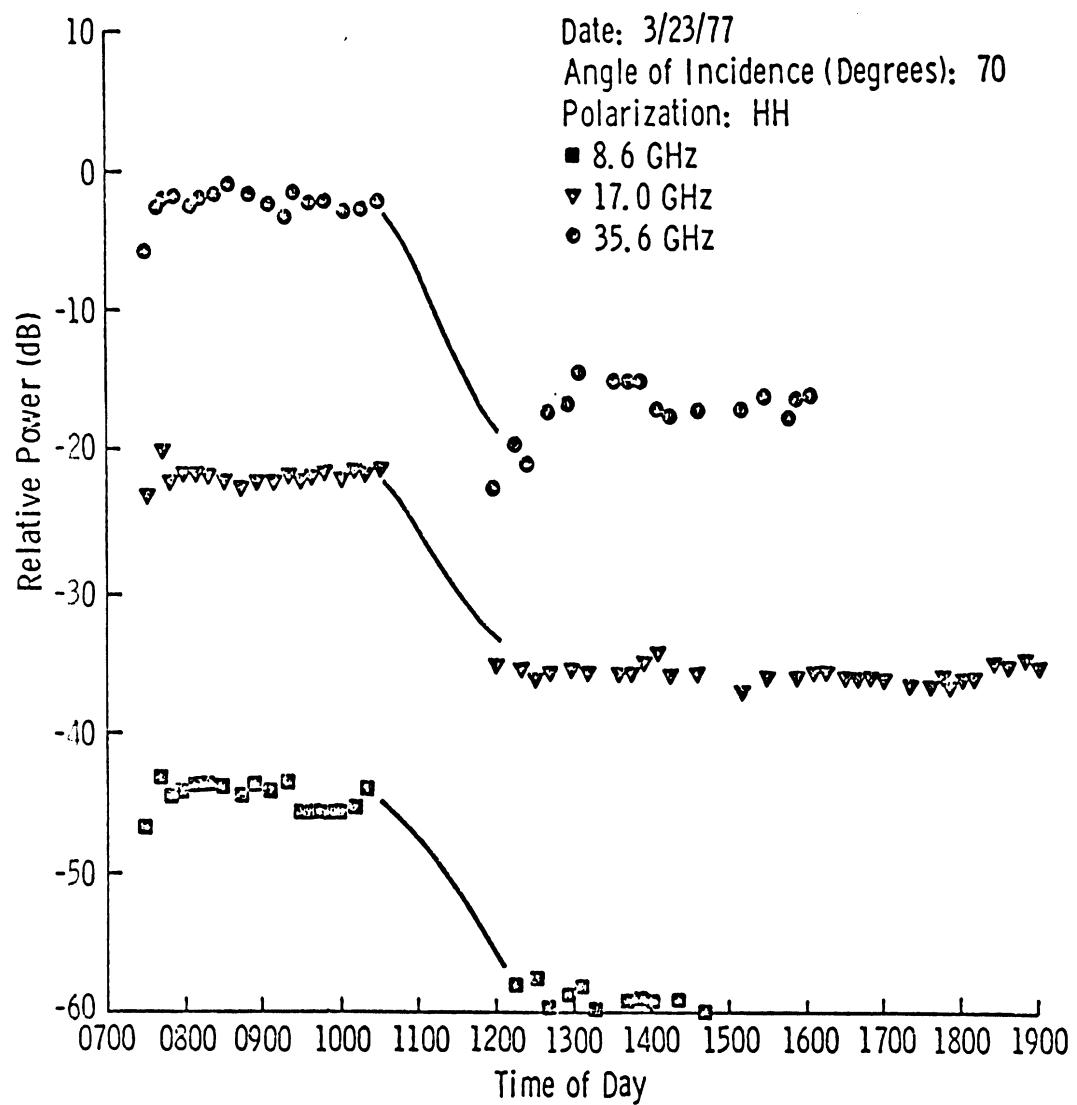

D. March 23, 1977 Diurnal

Snow wetness and temperature variation over the measurement period of the diurnal experiment on 3/23/77.

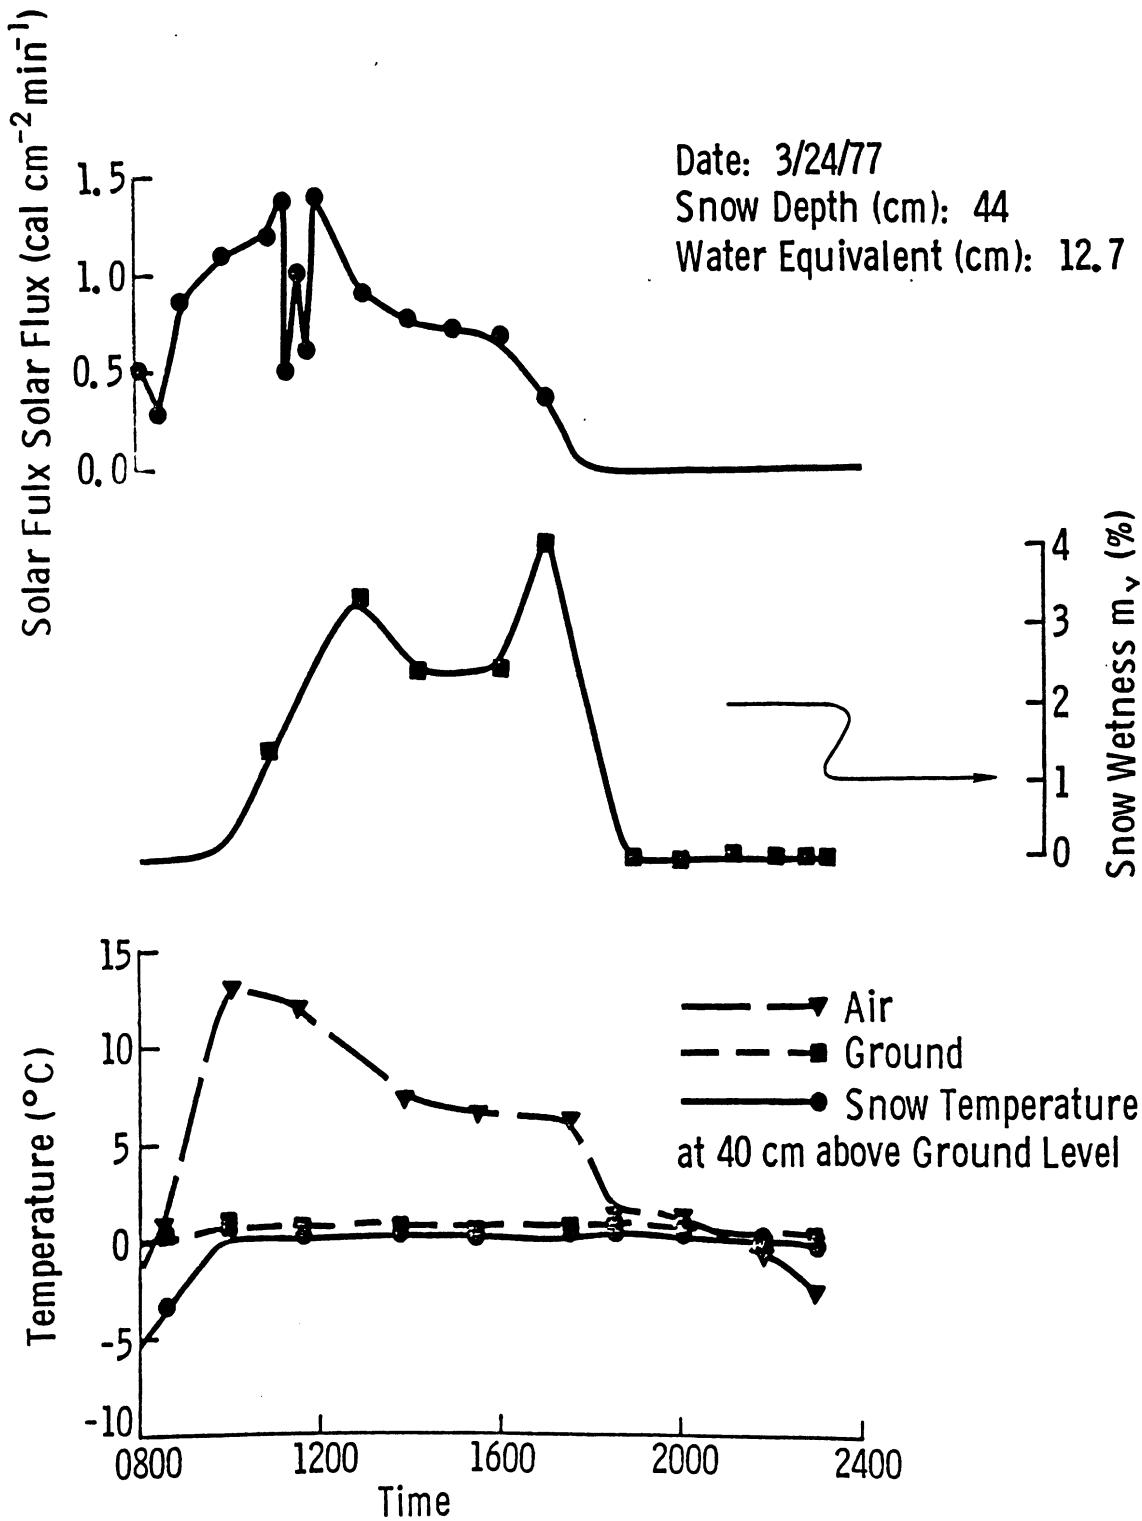

Time variation of 50° backscatter power at 8.6, 17.0, and 35.6 GHz.

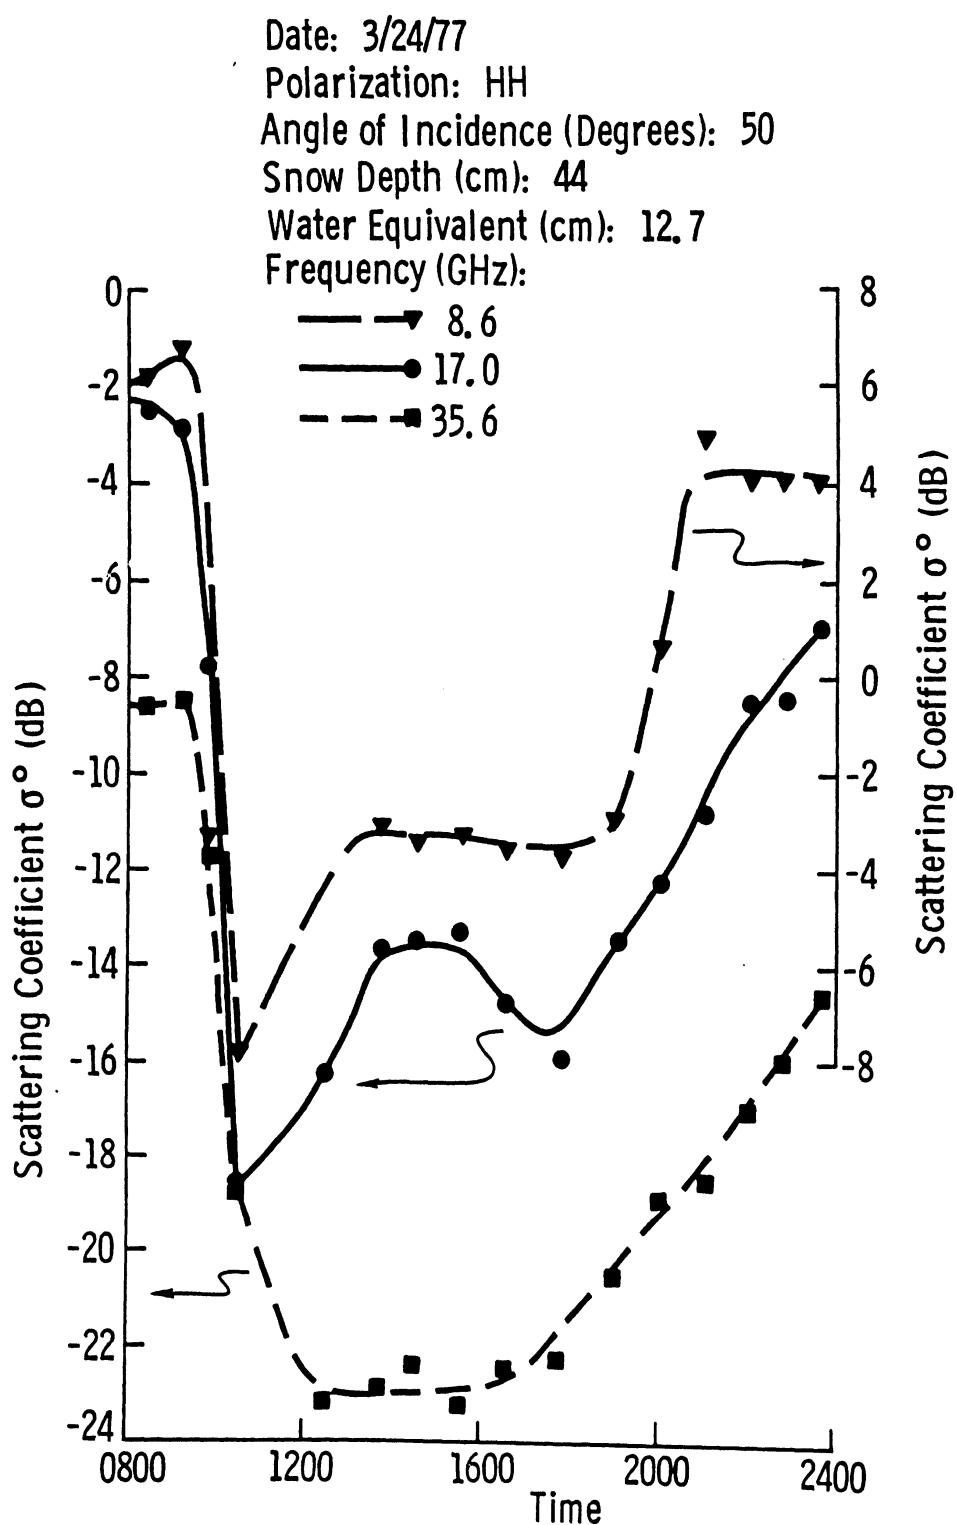

Time variation of 70° backscatter power at 8.6, 17.0, and 35.6 GHz.

E. March 24, 1977 Diurnal

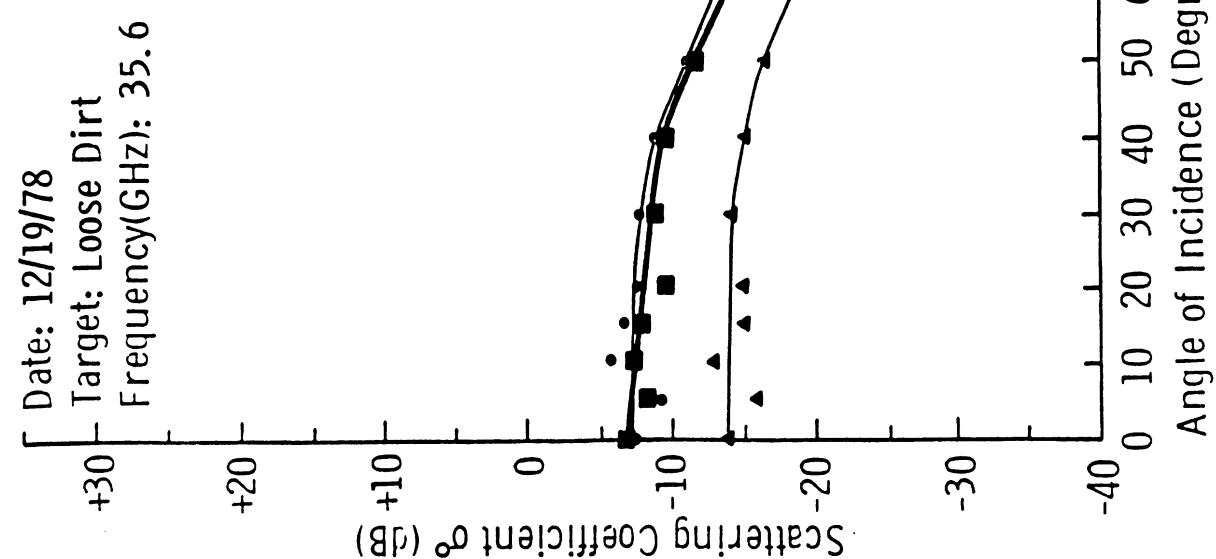

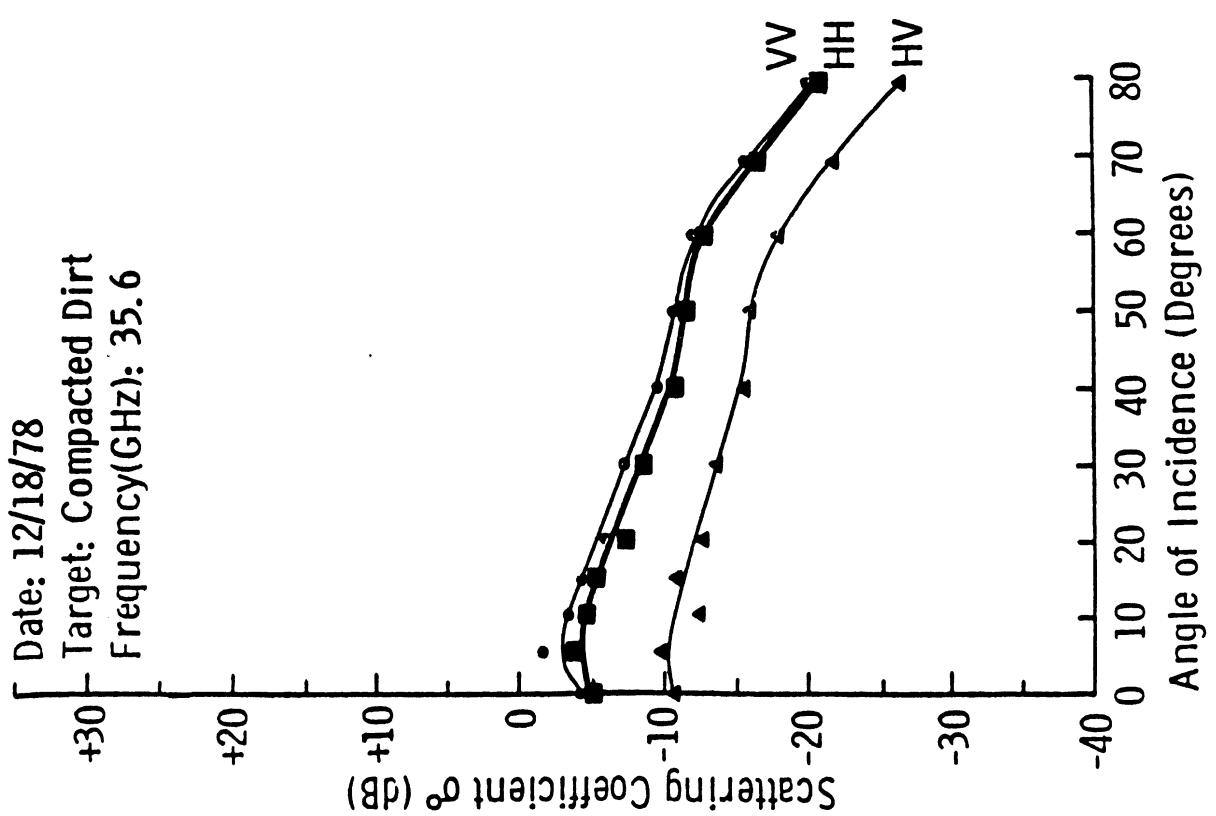

Diurnal variation of ground truth data on 3/24/77.

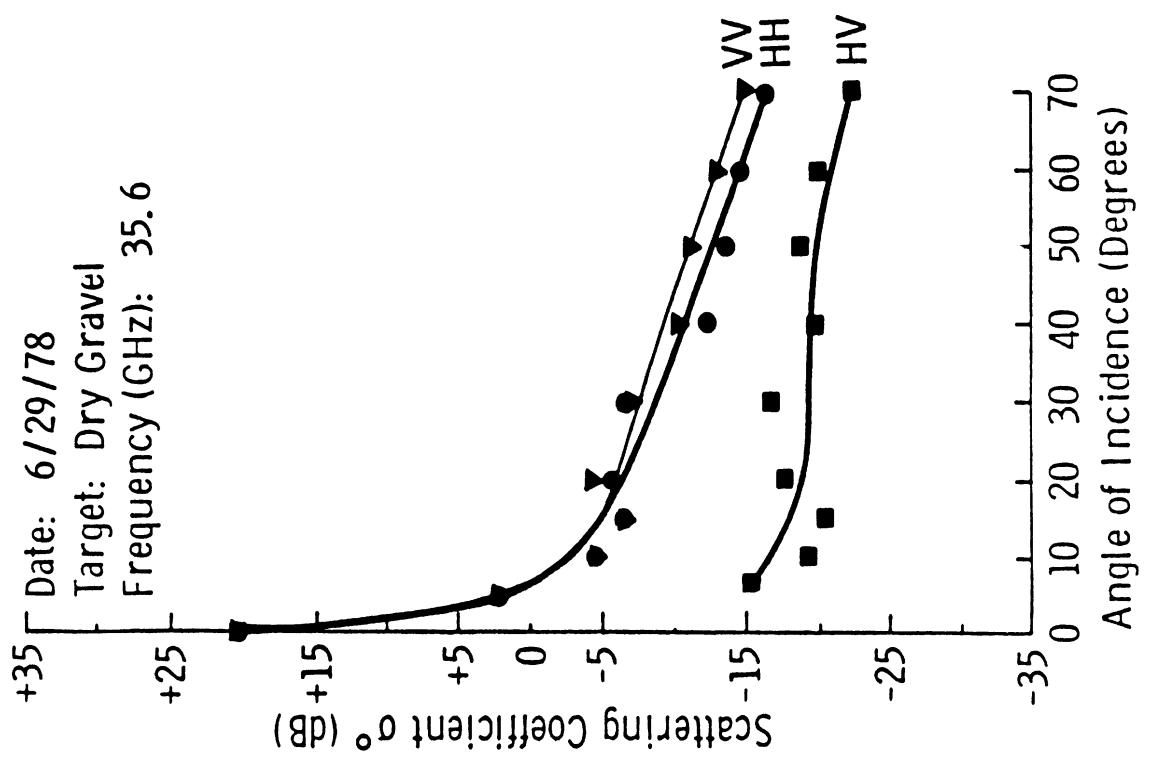

Diurnal variation of  $\sigma^0$  at 8.6, 17.0 and 35.6 GHz at  $50^\circ$  angle of incidence.

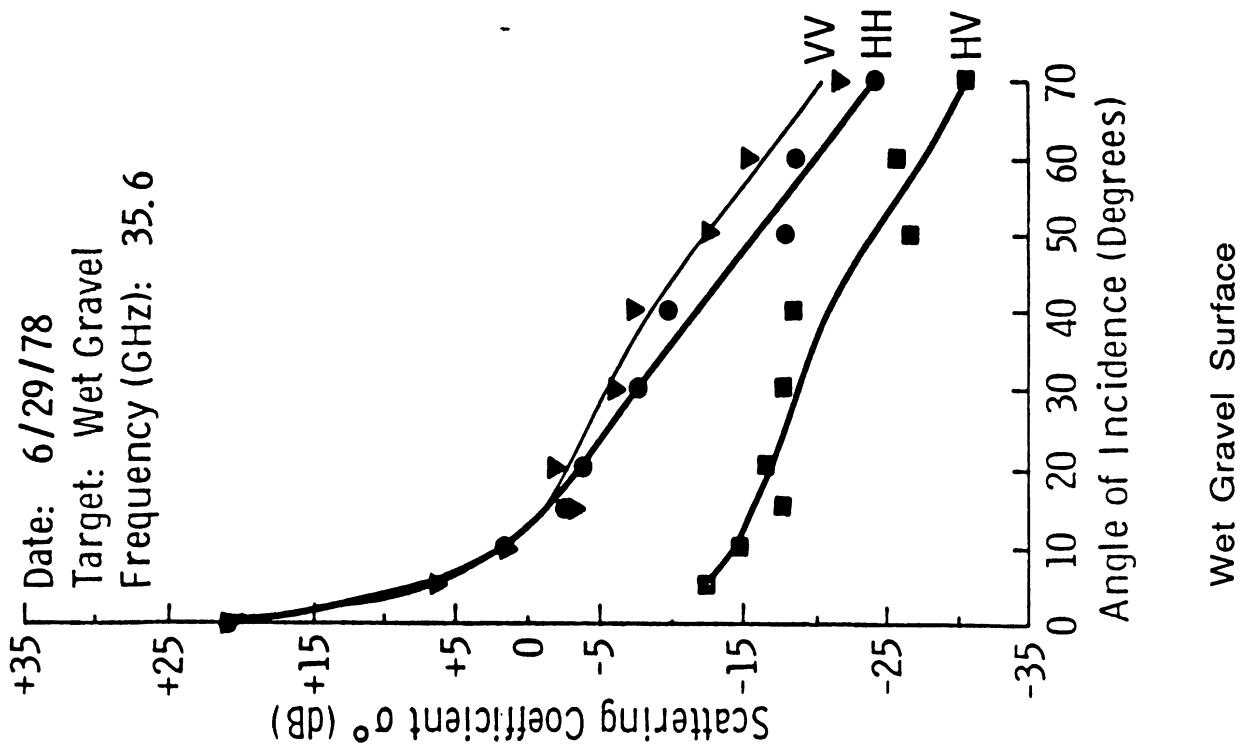

### 13. 35 GHz DATA FOR ROAD SURFACES

#### A. Various Surfaces

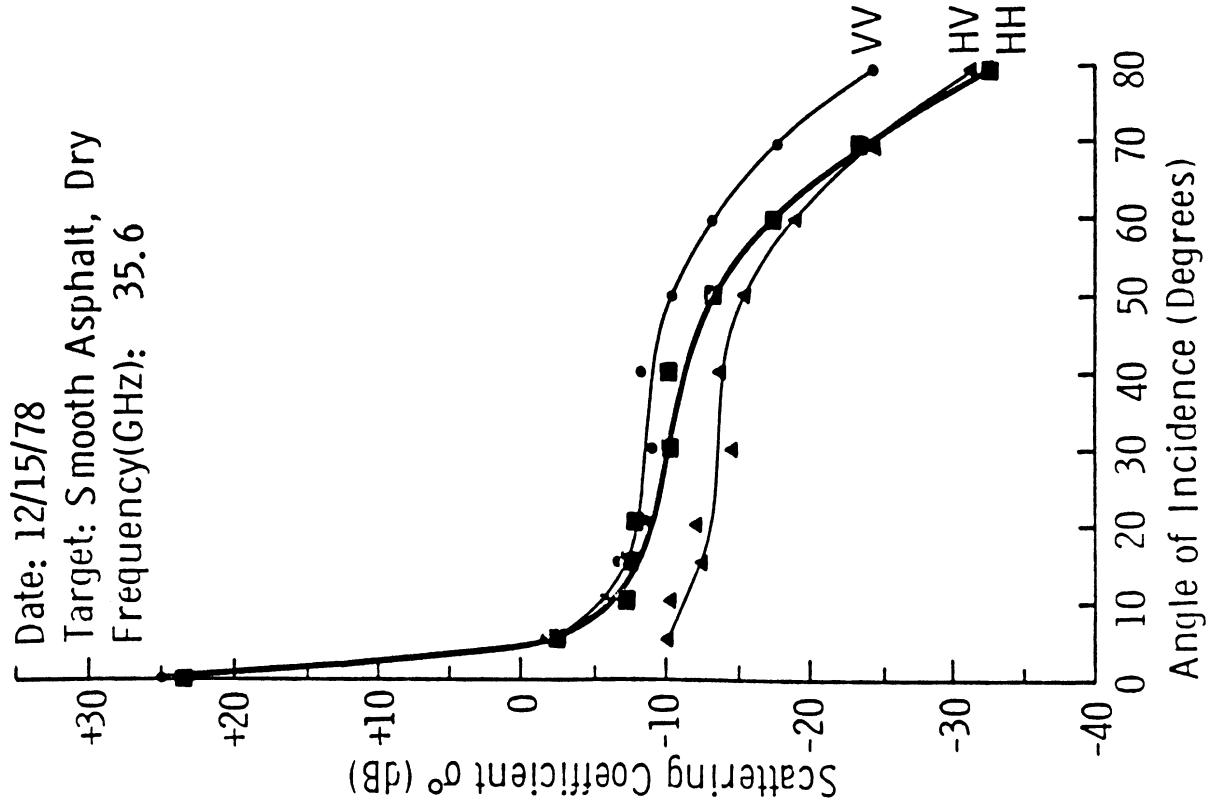

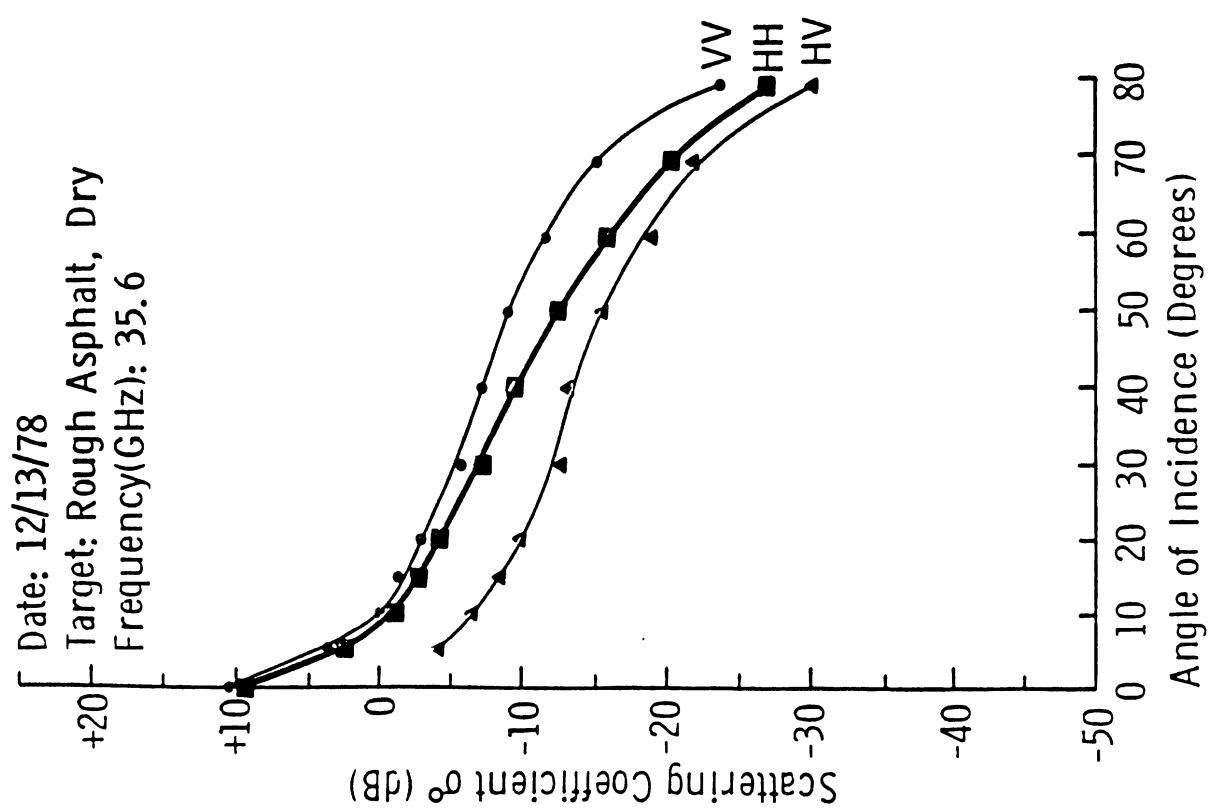

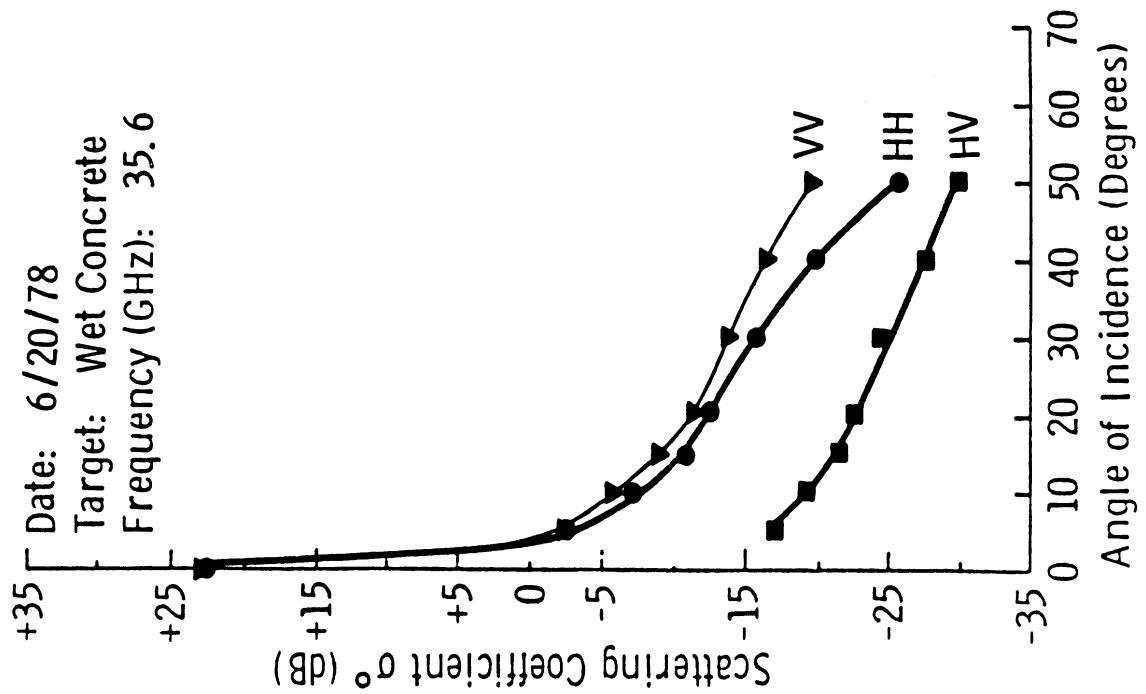

Dry Gravel Surface

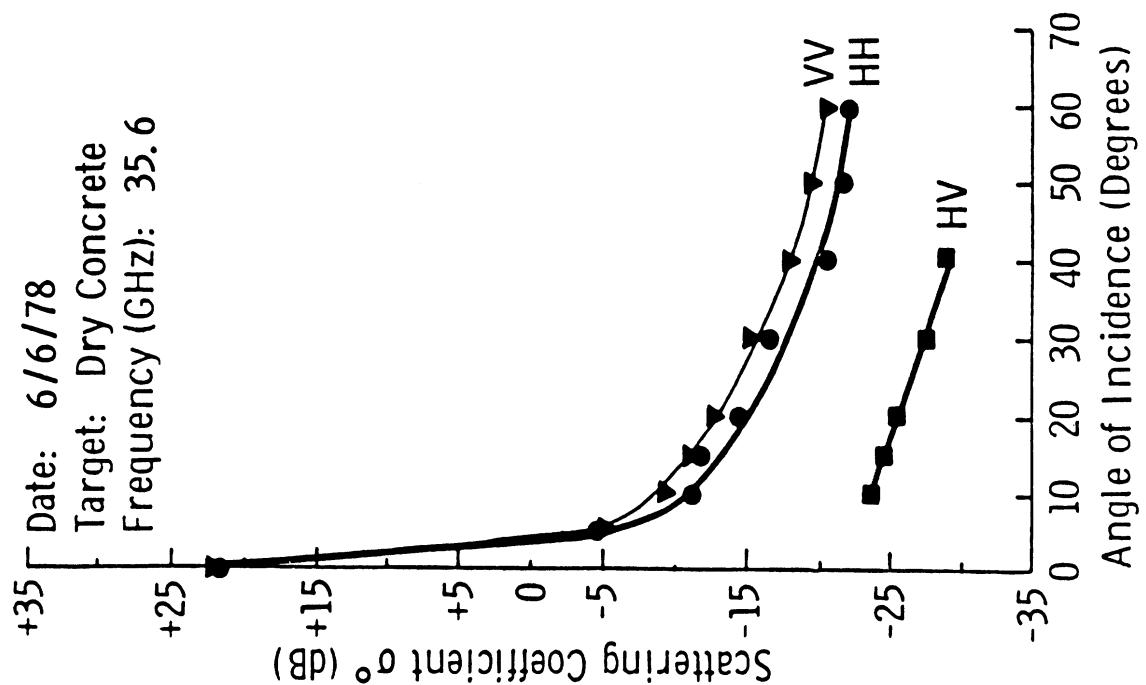

Wet Gravel Surface

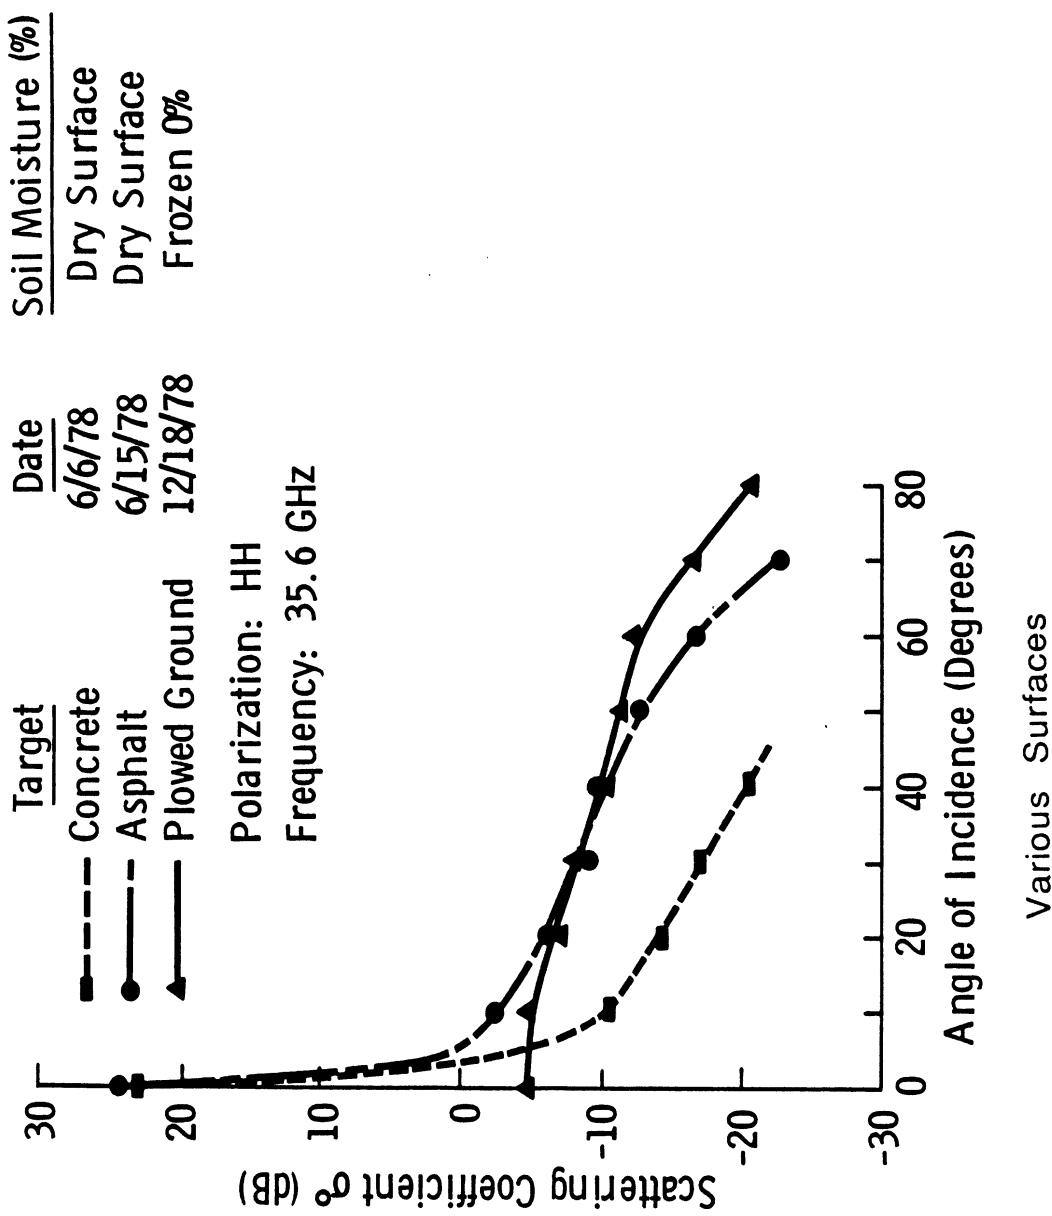

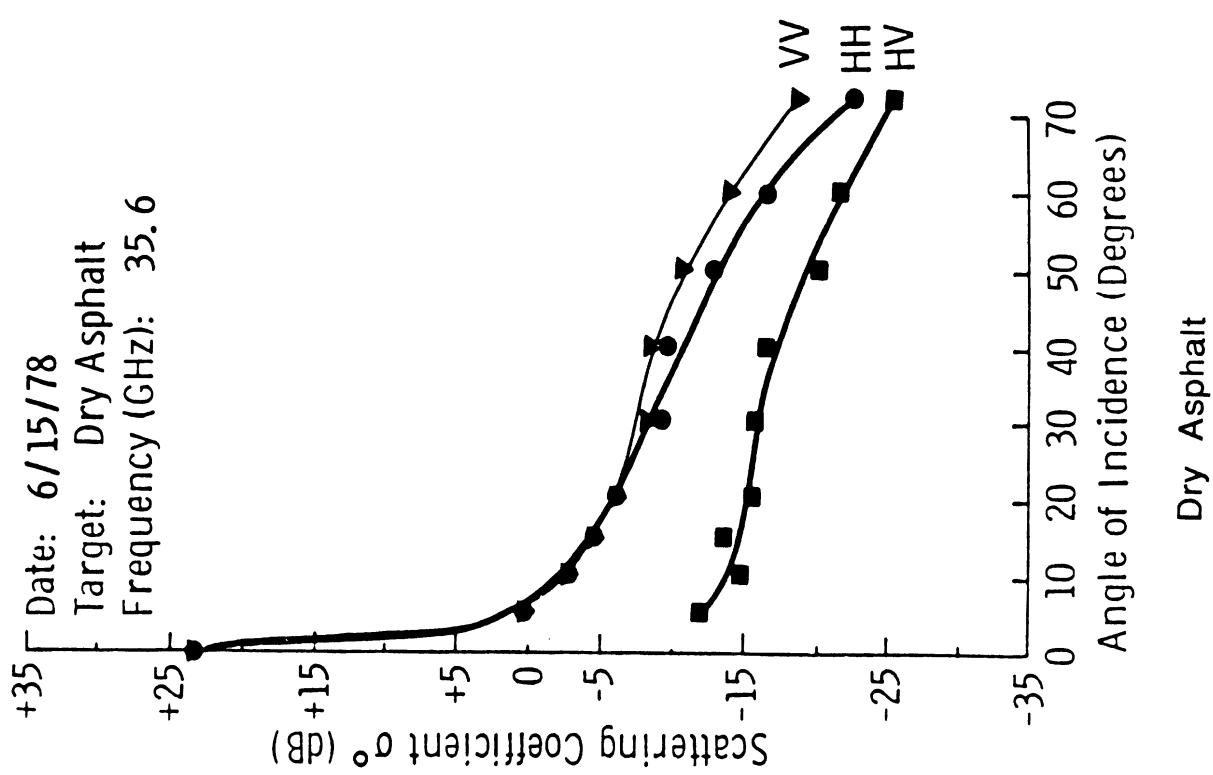

Wet Concrete

Dry Concrete

## B. Road Surfaces With Snow Cover

(1) At 2 cm below the surface.

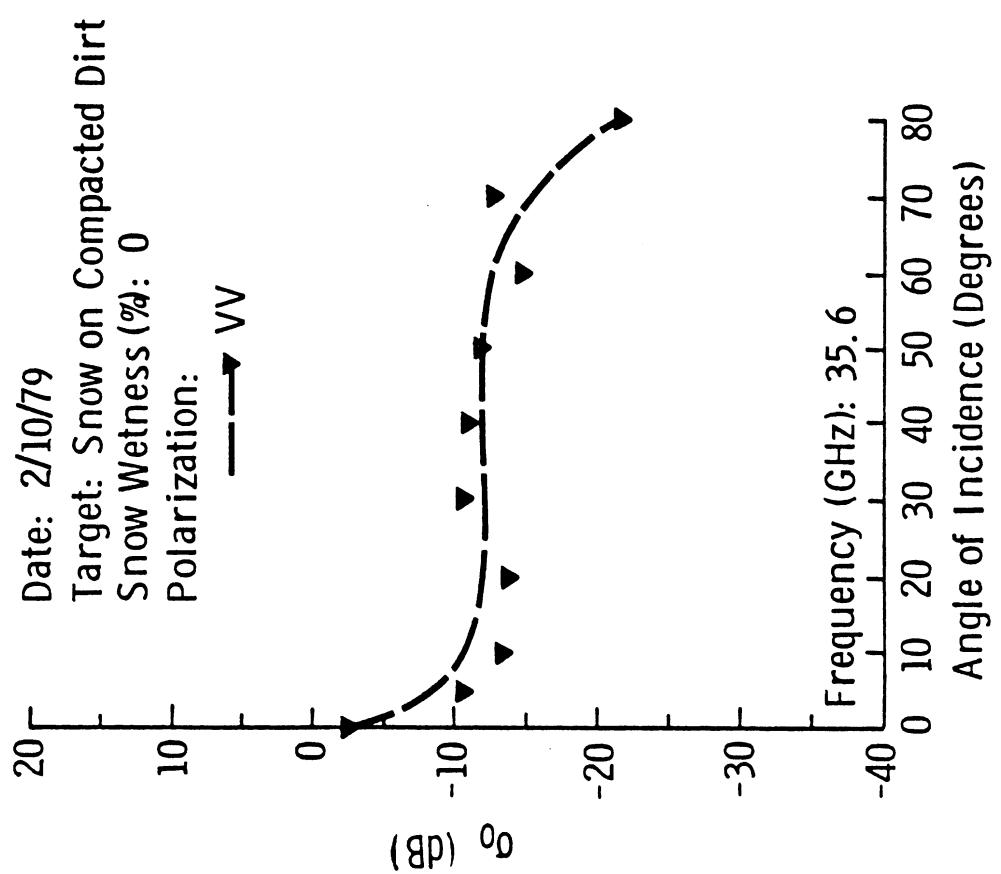

(2) Ice layer underneath snow 5 cm thick.

(3) Layer consisted of packed snow, slush, water and ice. Wetness was not measured; however, the snow was wet.

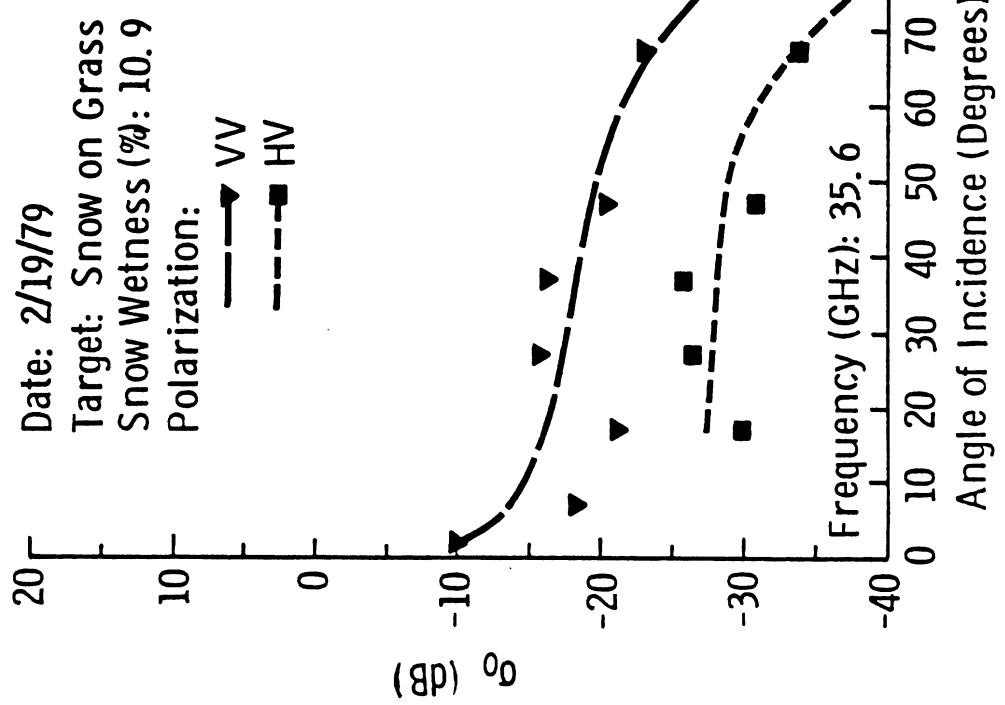

(4) N.M.--not measurable with present technique.

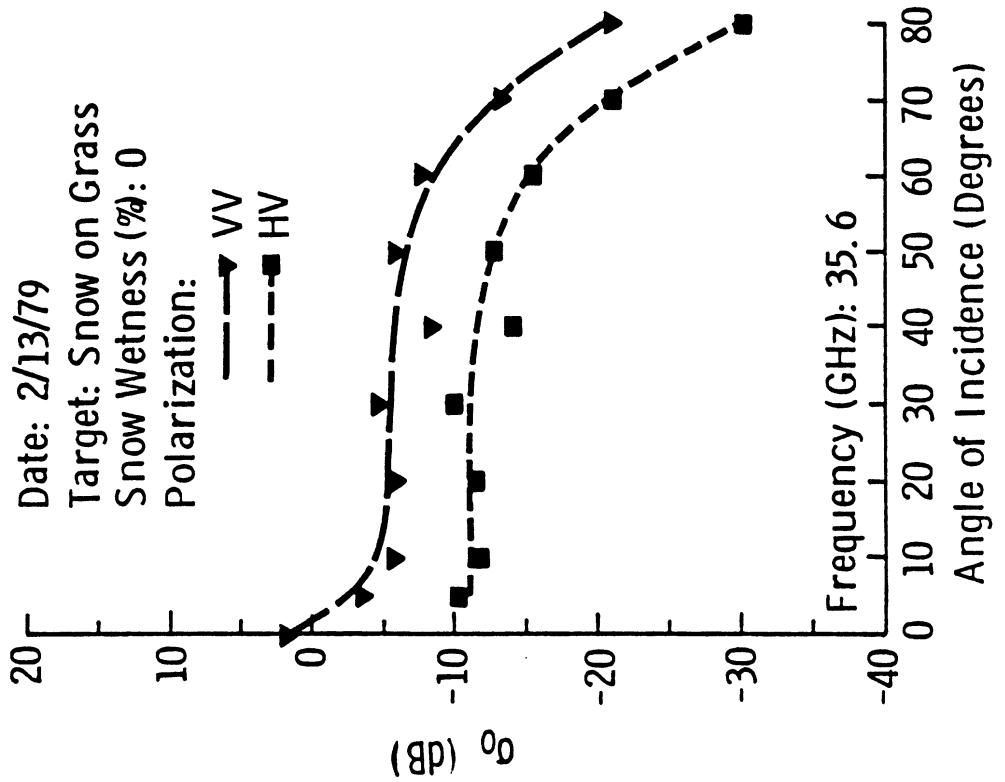

Wet Snow on Compacted Dirt Surface

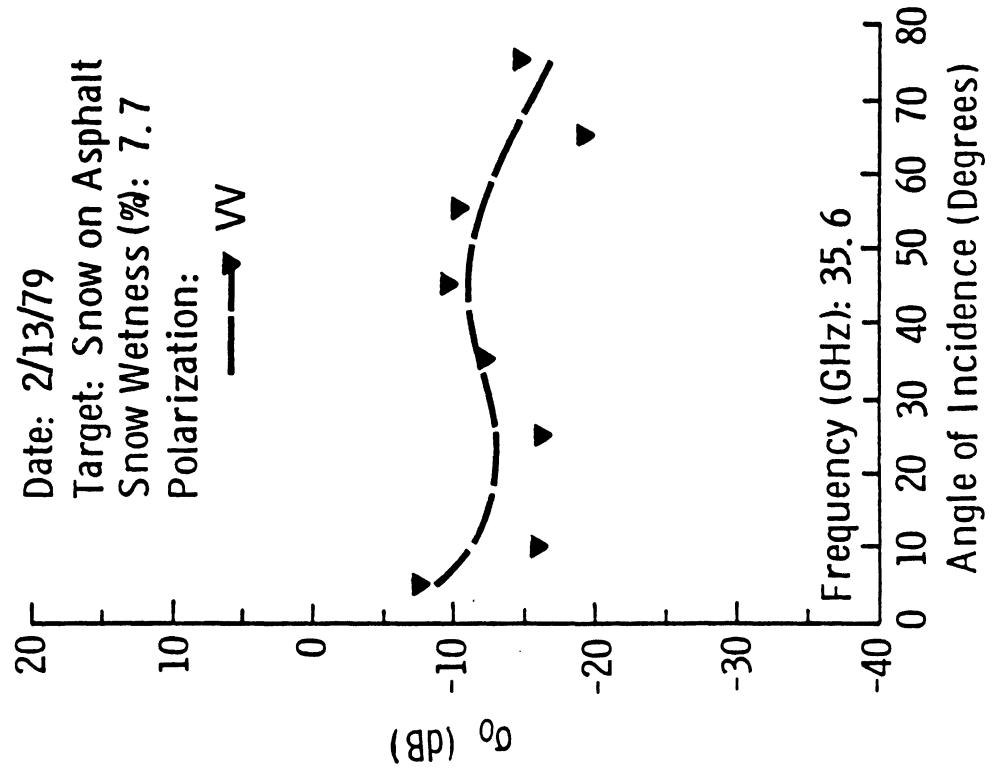

Dry Snow on Compacted Dirt Surface

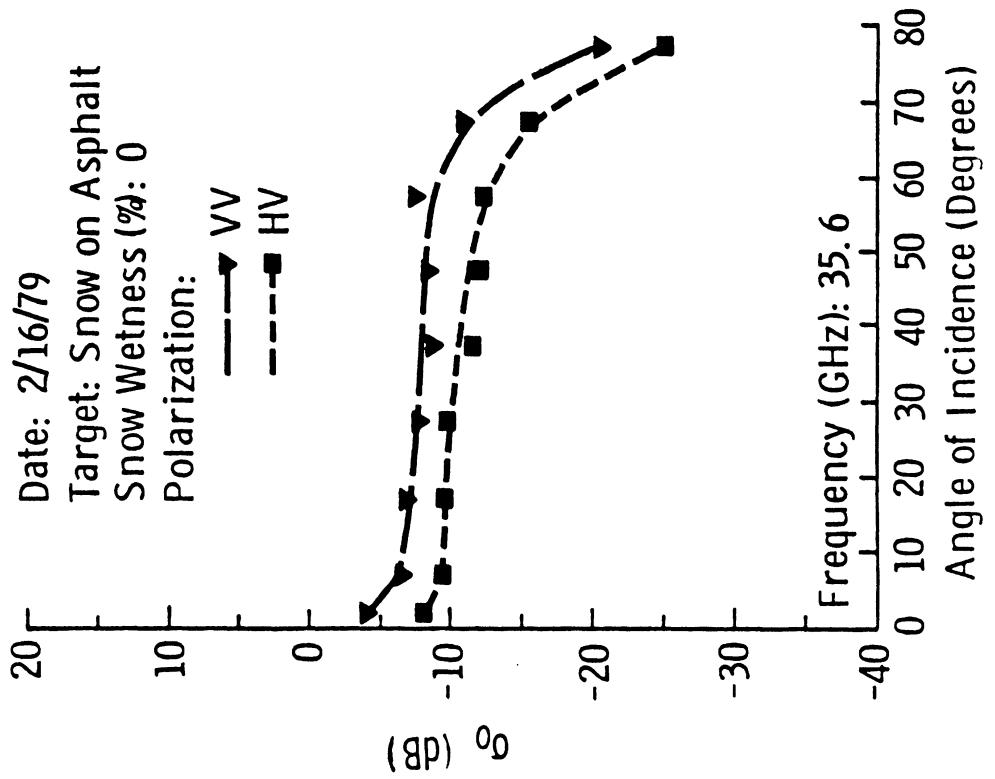

Wet Snow on Grass

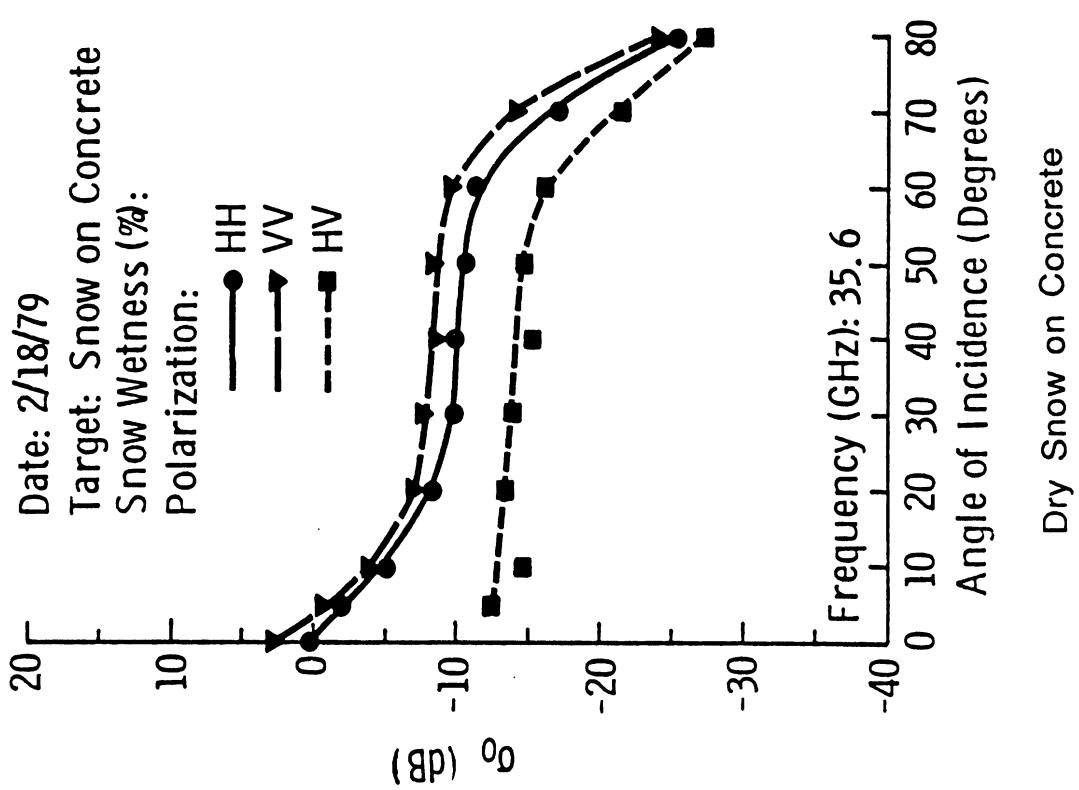

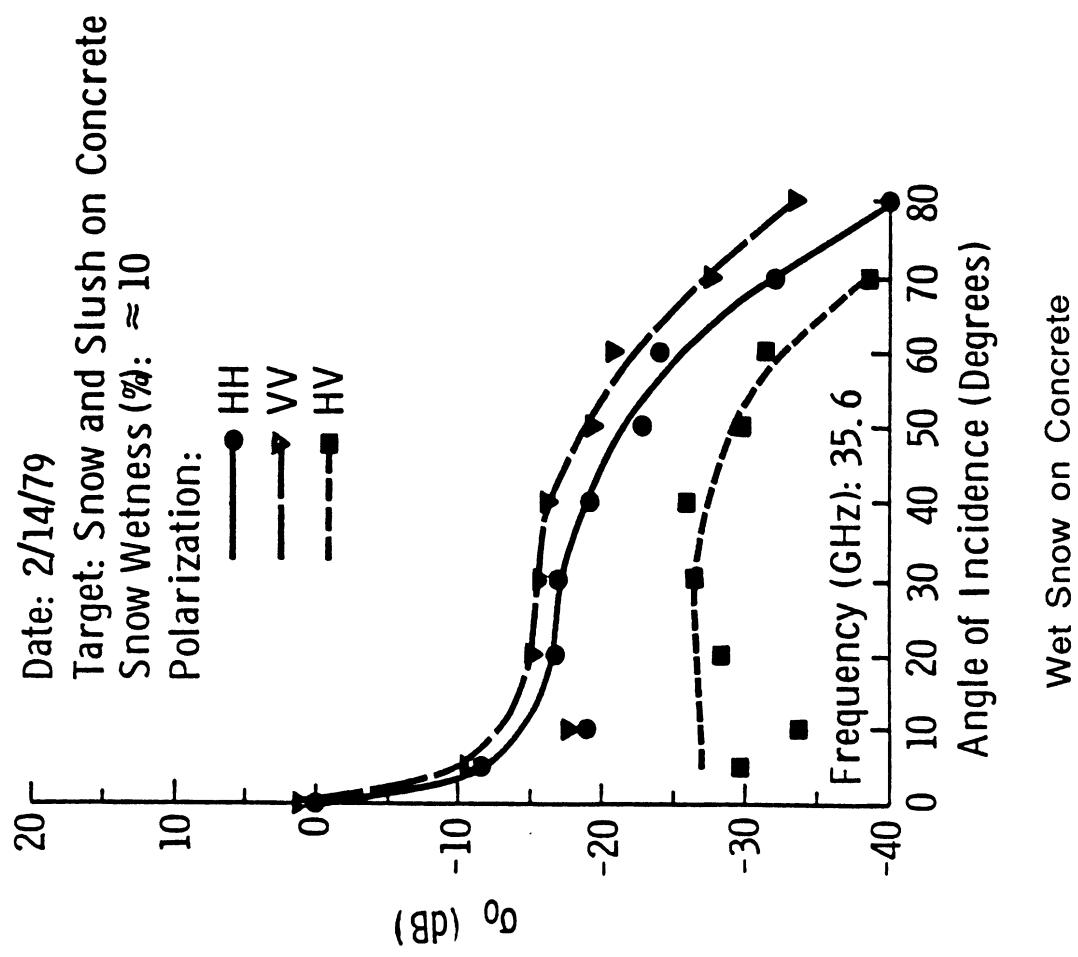

Dry Snow on Grass

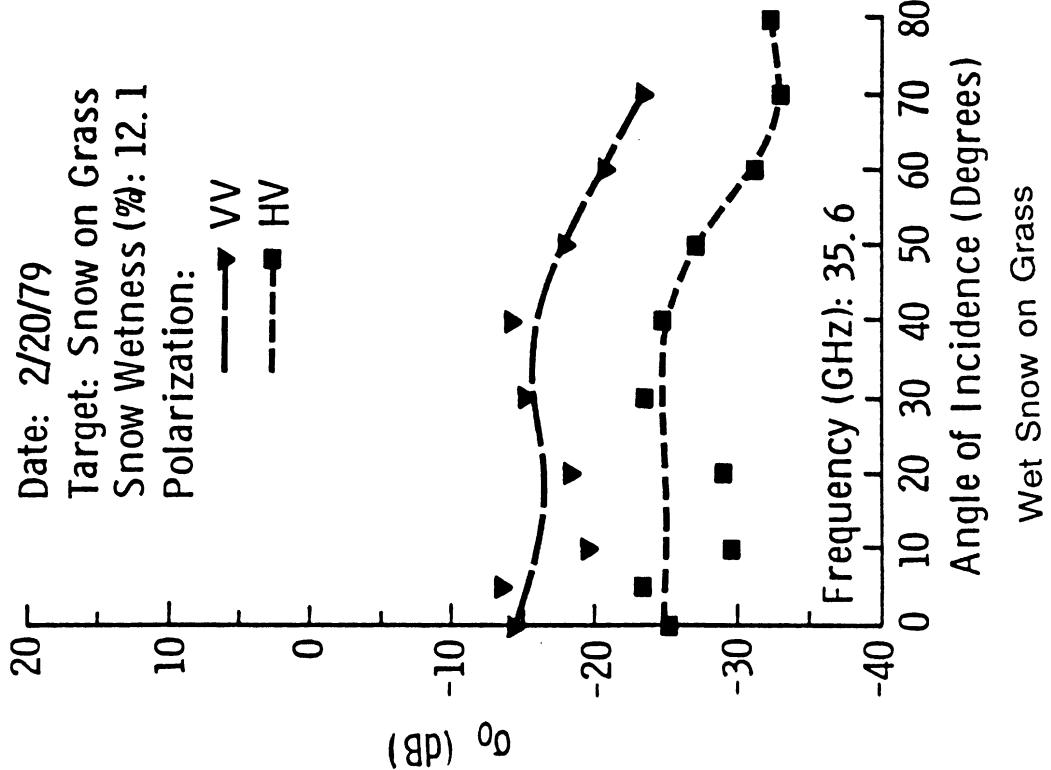

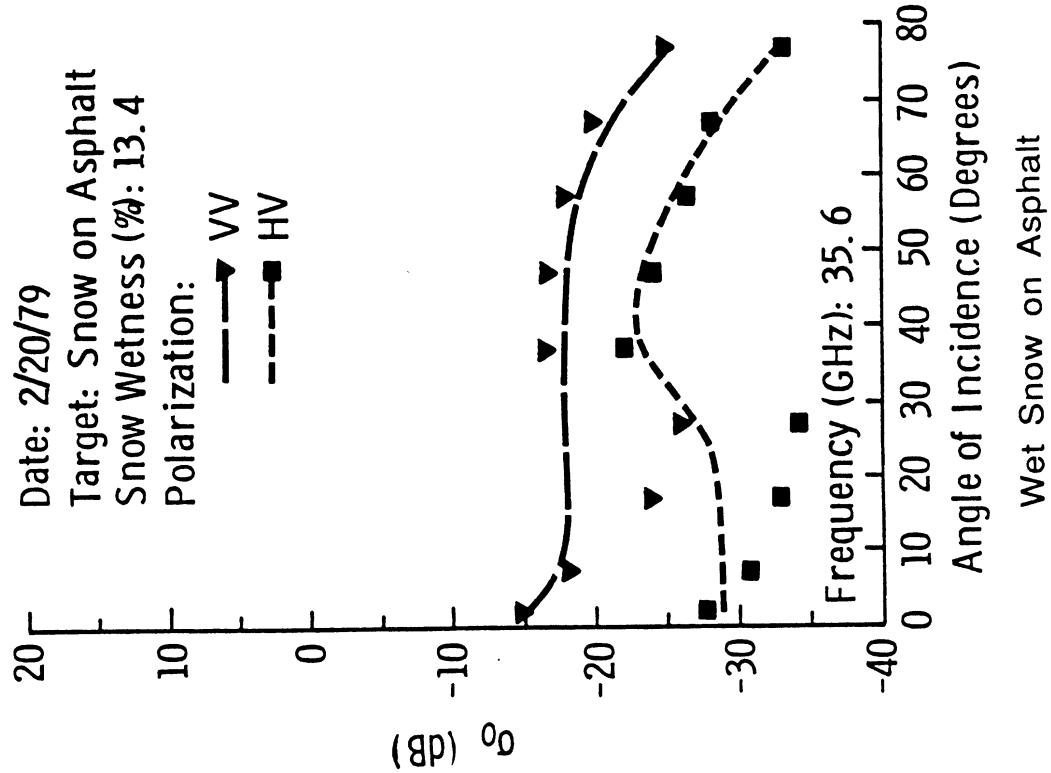

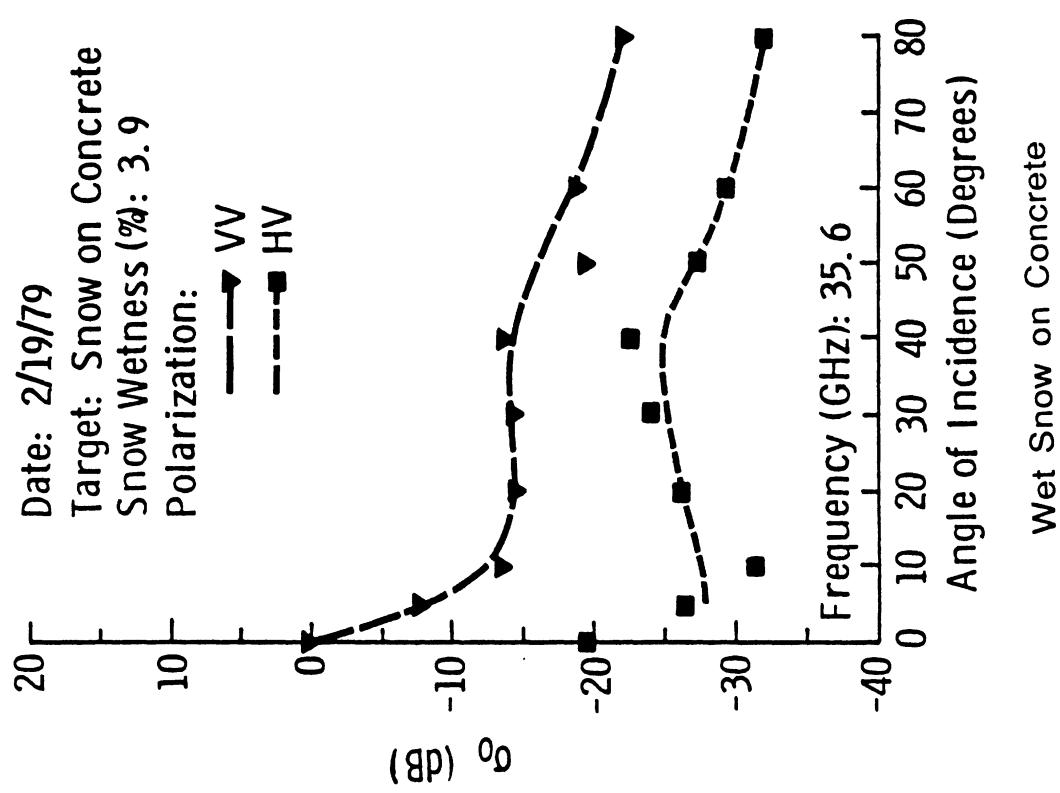

Wet Snow on Asphalt

Dry Snow on Asphalt

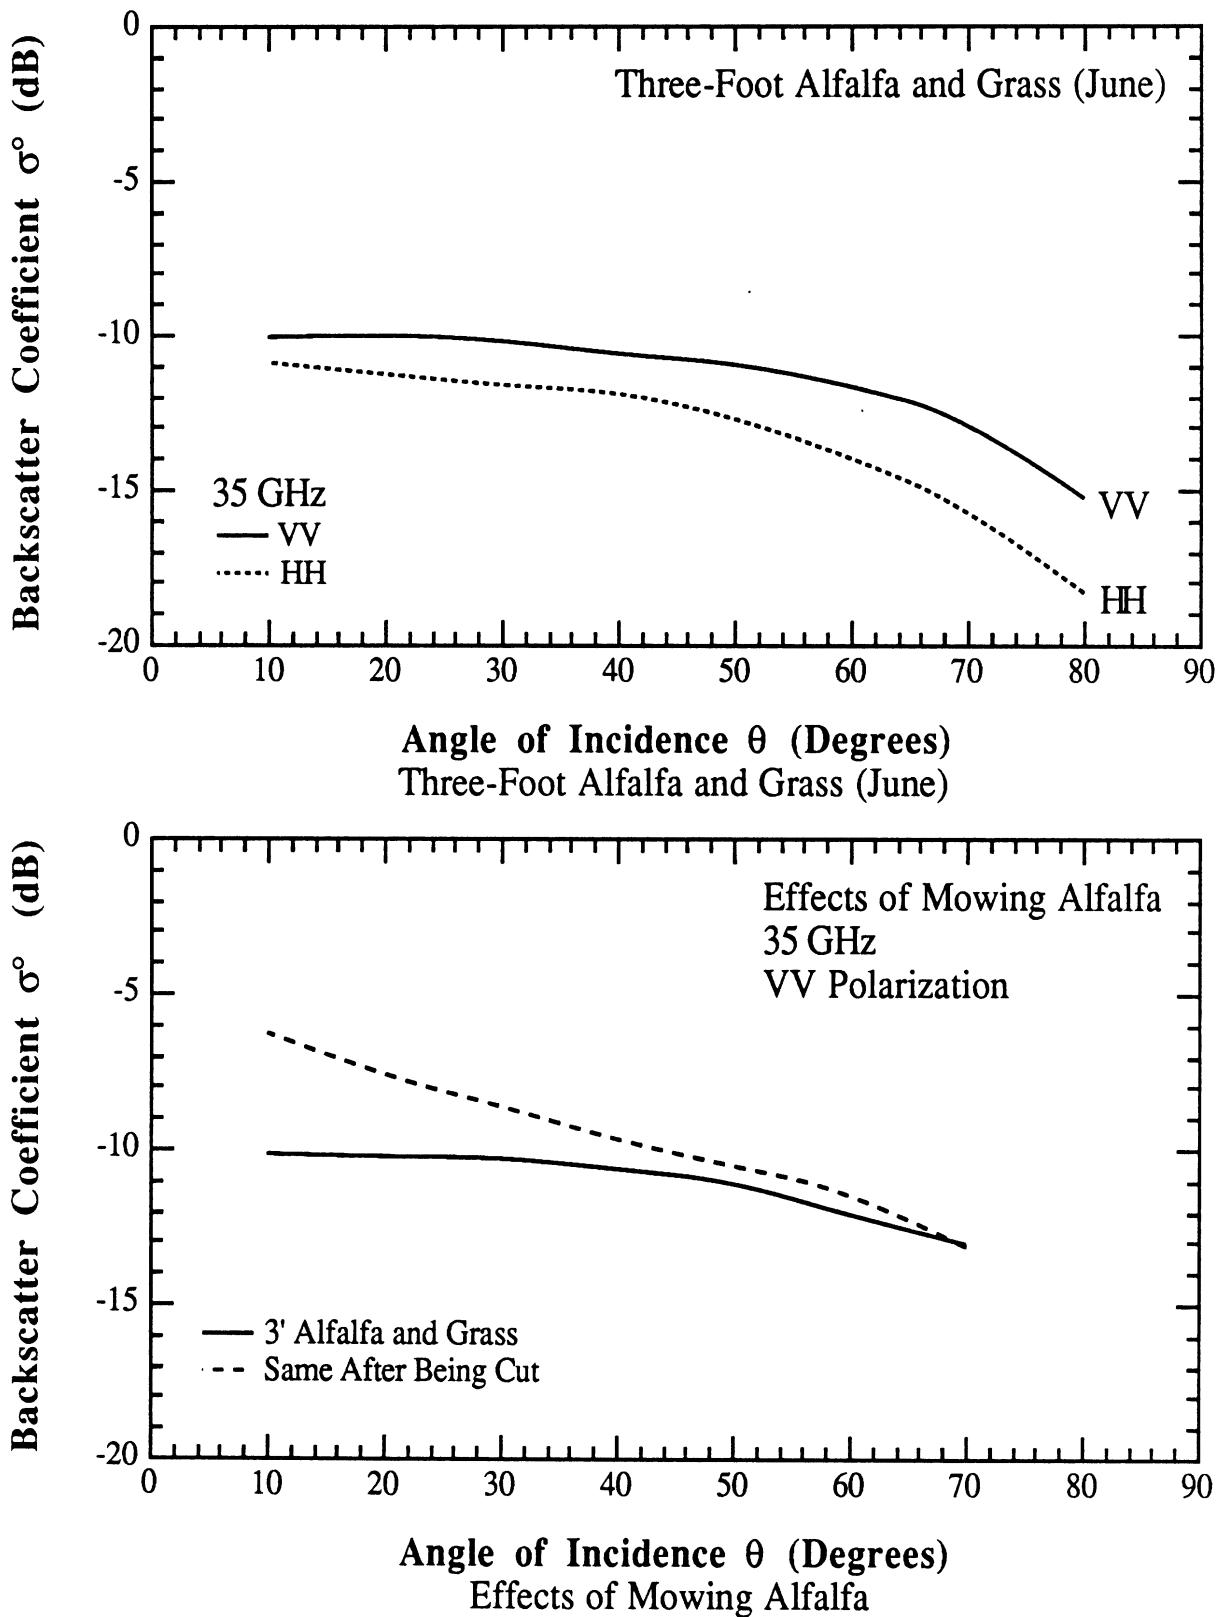

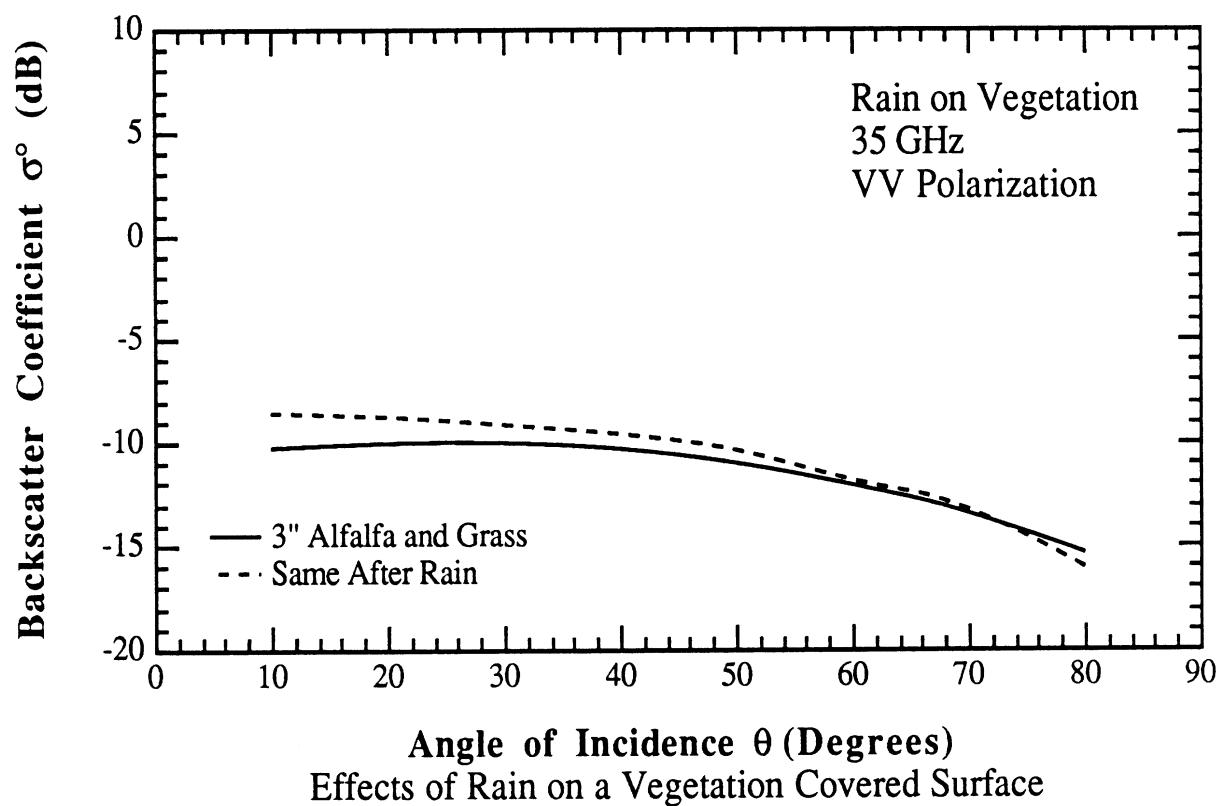

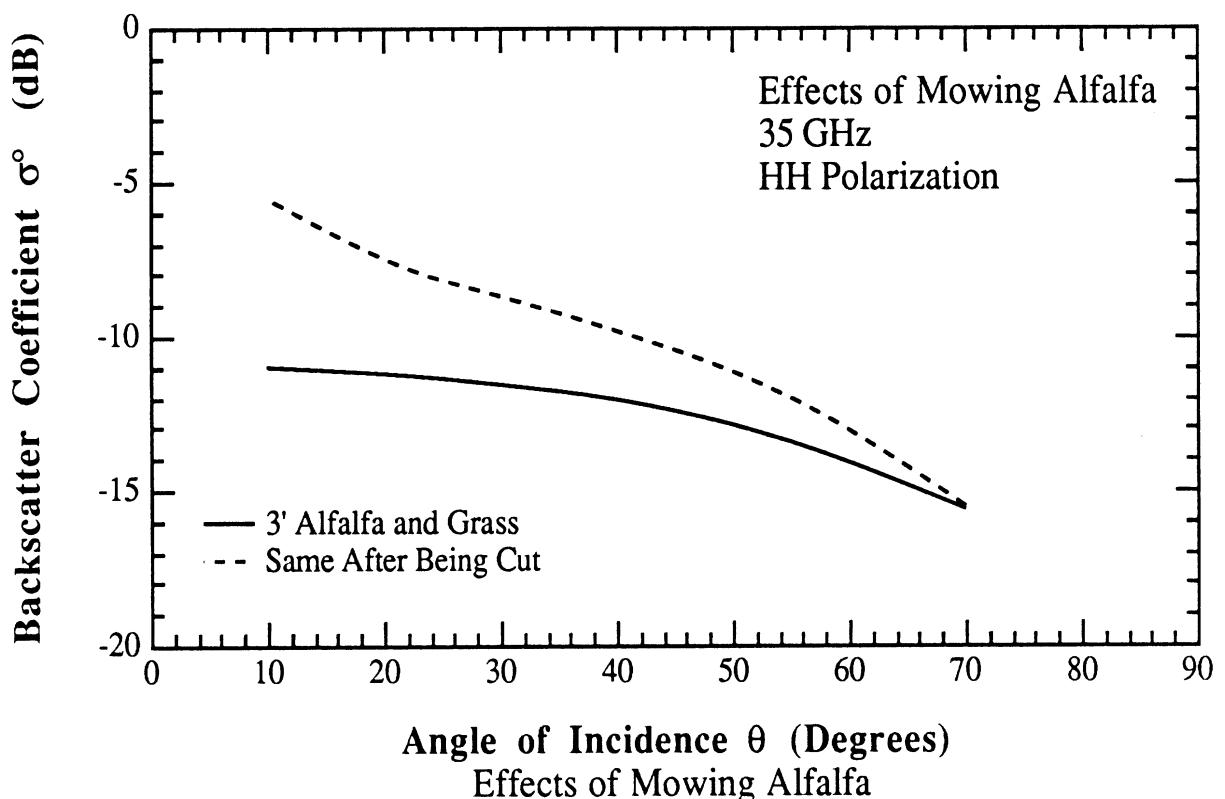

## PART IV. OHIO STATE UNIVERSITY DATA

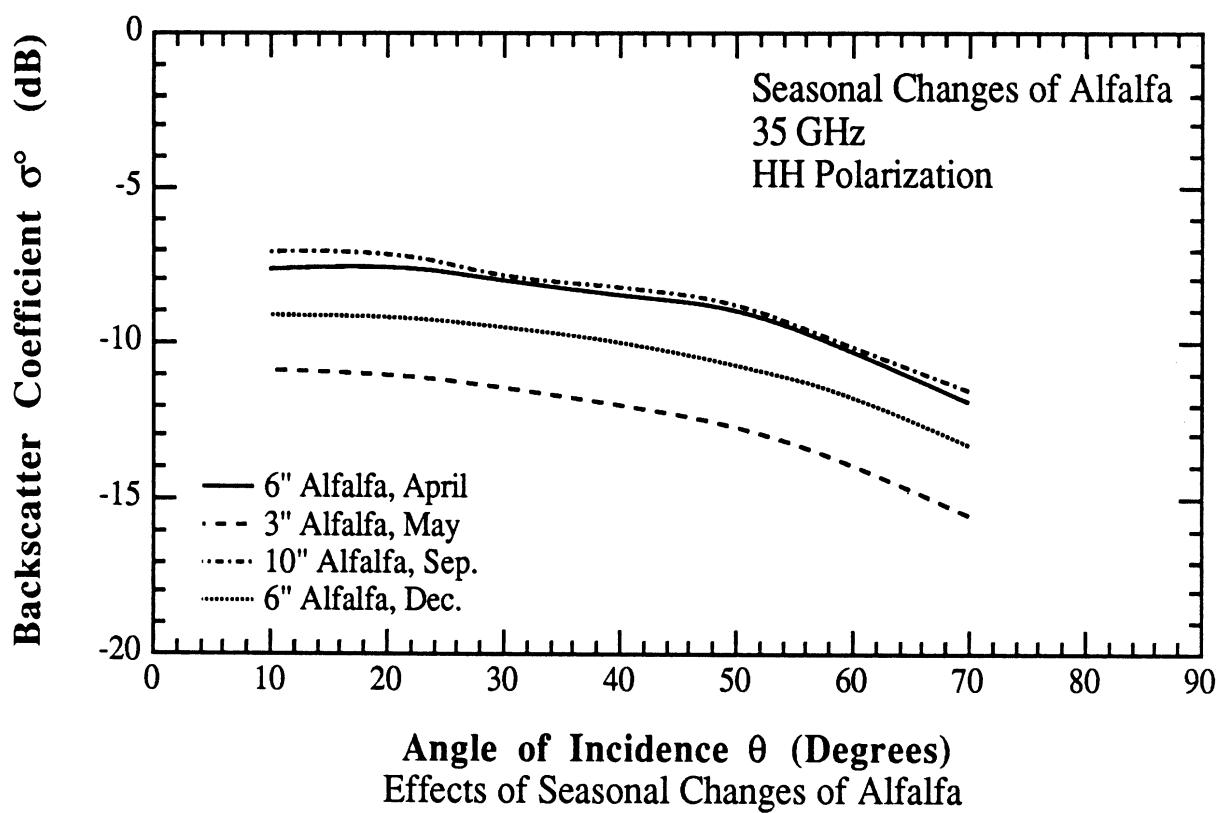

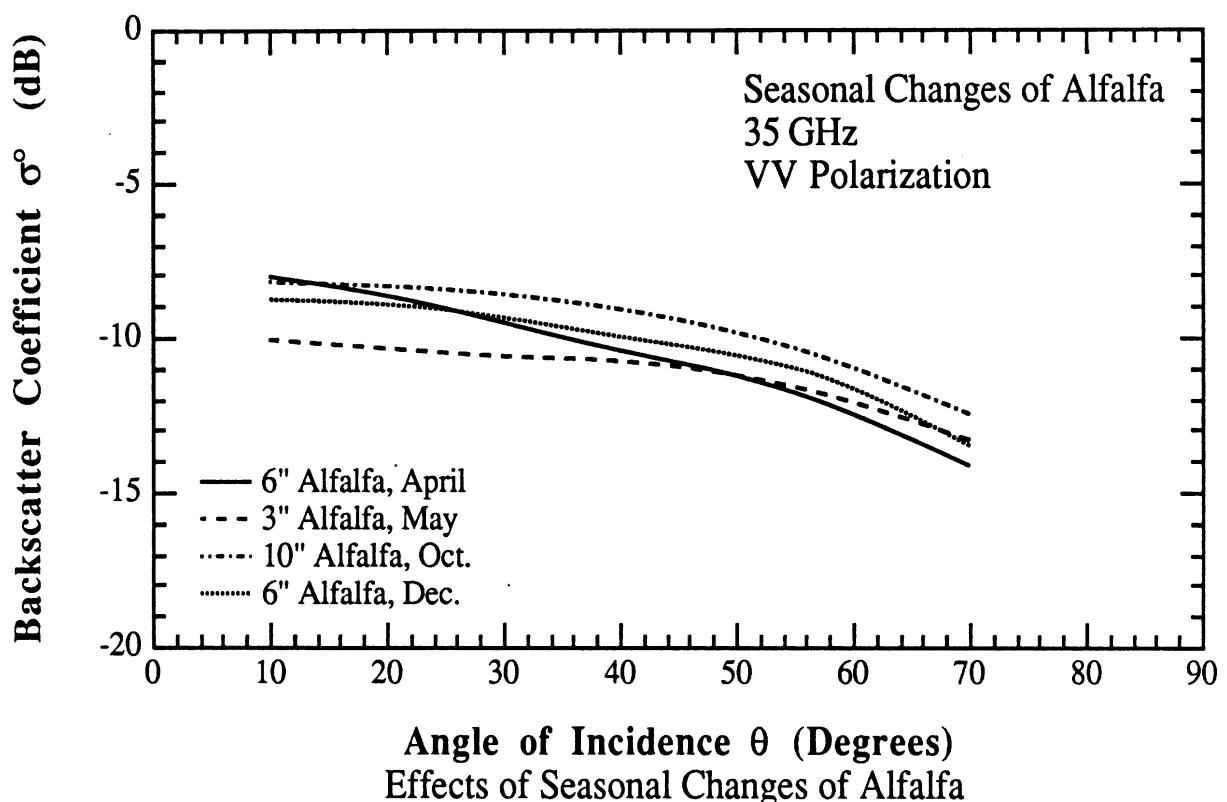

The Ohio State University data presented in this part of the Handbook were extracted from references [21] and [22]. In its original form, the data were presented in the form of plots of  $\gamma = \sigma^0 / \cos \theta$  versus the depression angle  $\theta' = 90^\circ - \theta$ . All data were converted to  $\sigma^0$  versus the incidence angle  $\theta$ . Moreover, for data measured prior to 1960, which includes all the data reported in the Terrain Handbook II [21] issued by OSU in May, 1960, the level of the data was off by about 6 dB due to a recorder calibration error. As noted in the article by Bush and Ulaby [27] and confirmed by Peake (one of the principal authors of the OSU reports) in the same article, the level of  $\sigma^0$  should be increased by 5-7 dB. Hence, all OSU data measured prior to 1960 has been increased in level by 6 dB in this Handbook.

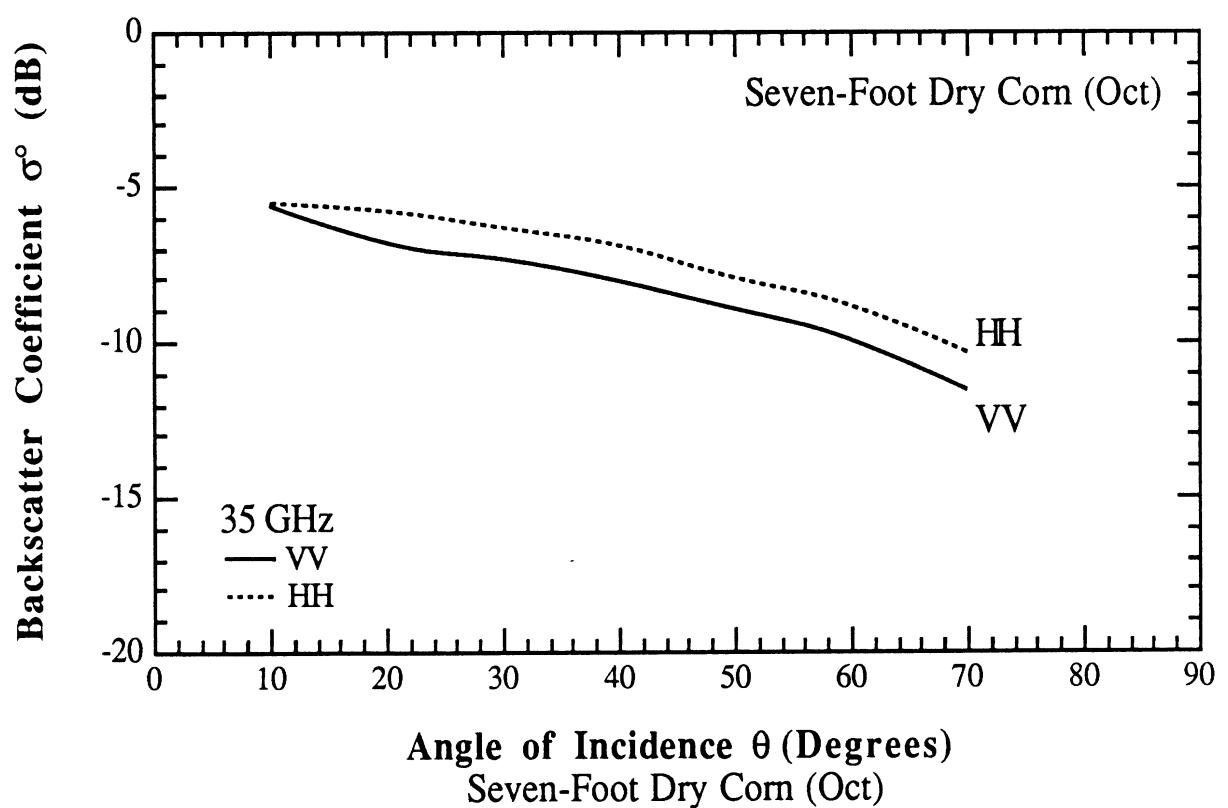

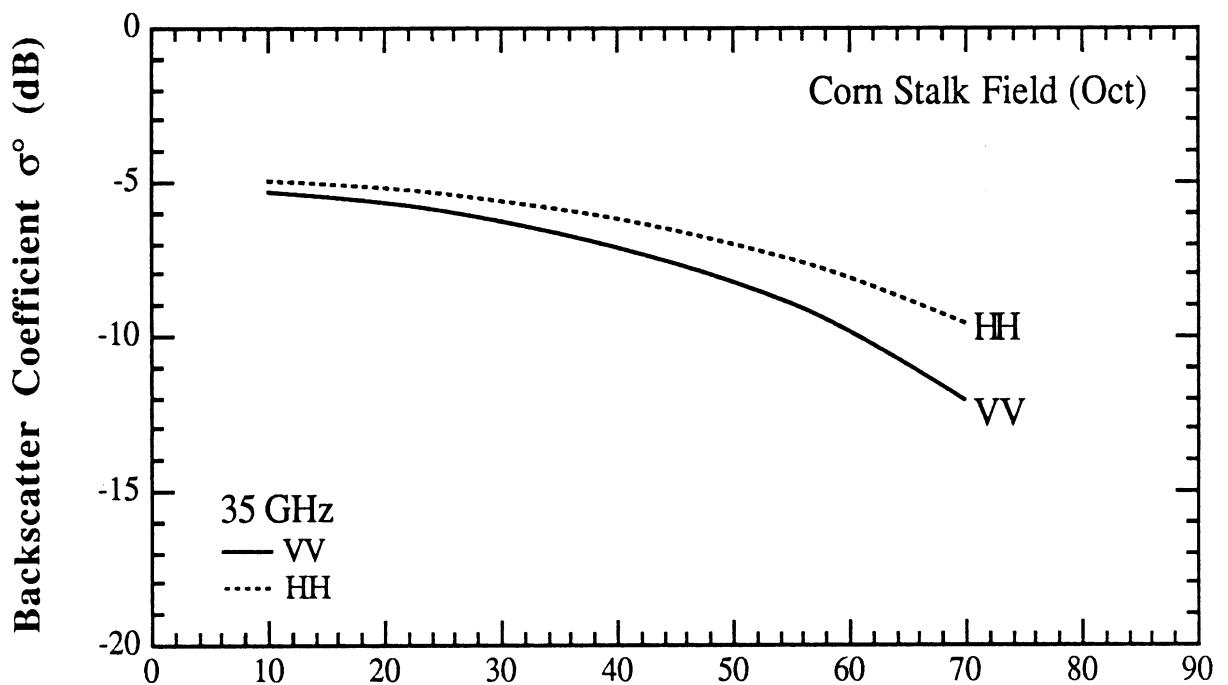

The OSU measurement program used a truck-mounted CW-Doppler radar to measure the backscatter as a function of incidence angle at 10, 15, and 35 GHz. Only the 35 GHz data is presented in this Handbook.

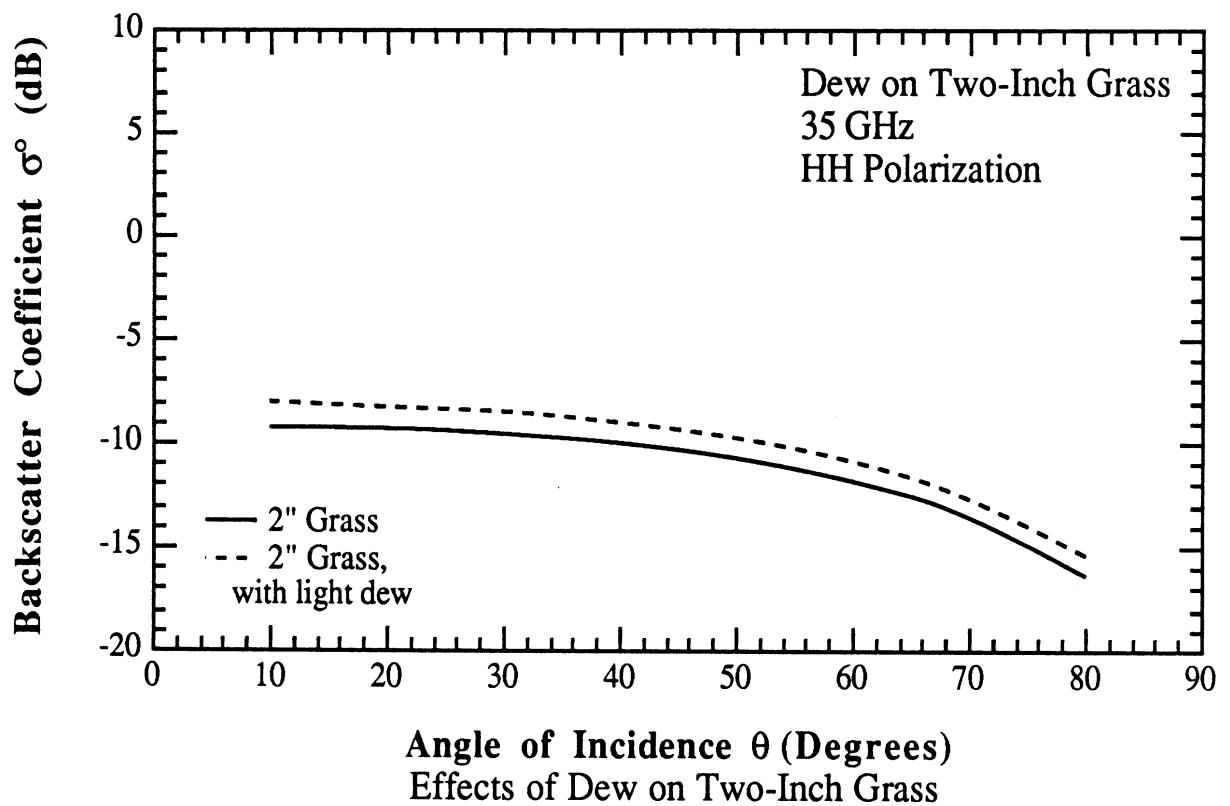

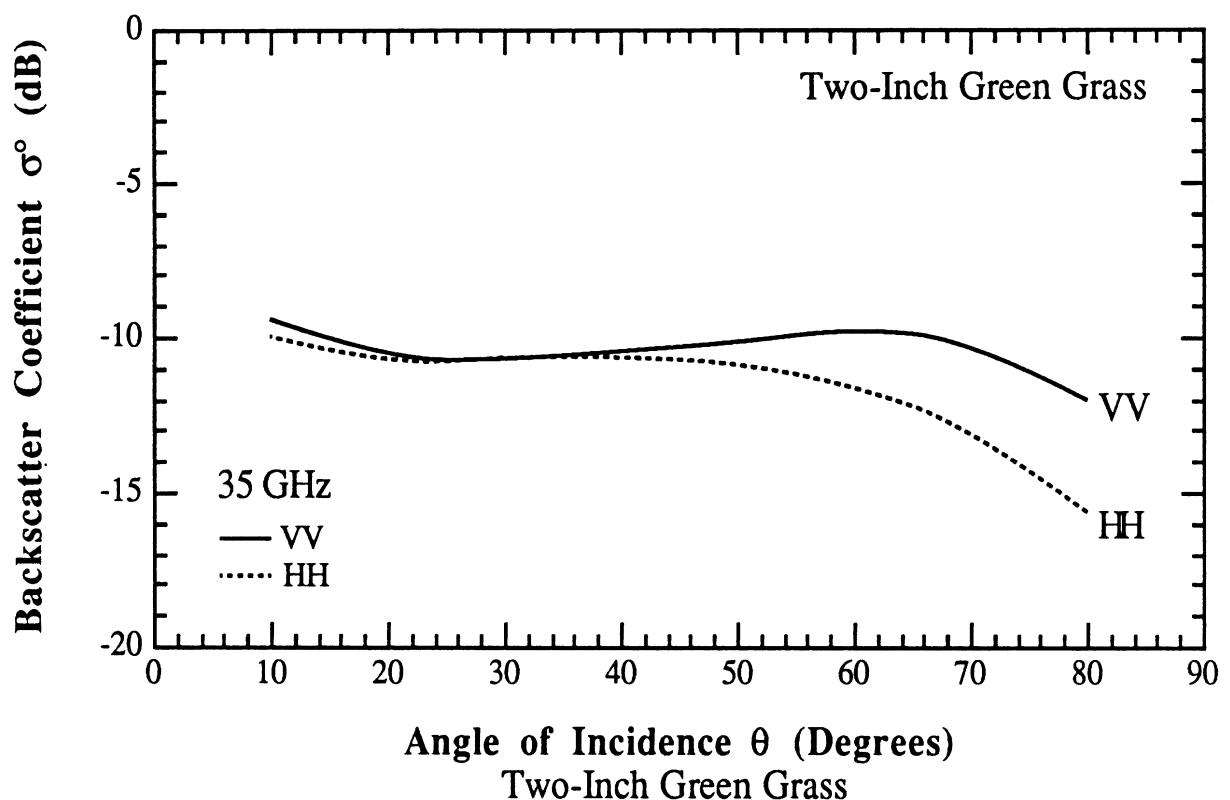

## 14. 35 GHz DATA FOR VEGETATION

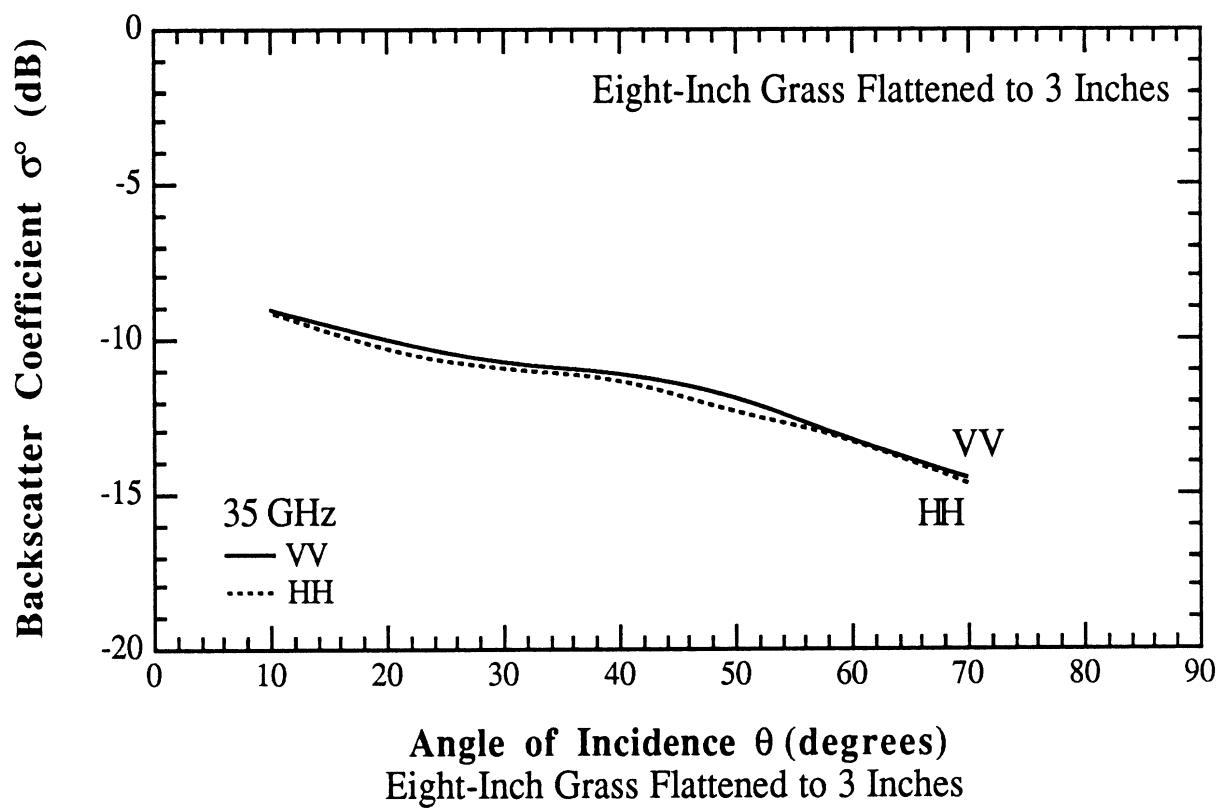

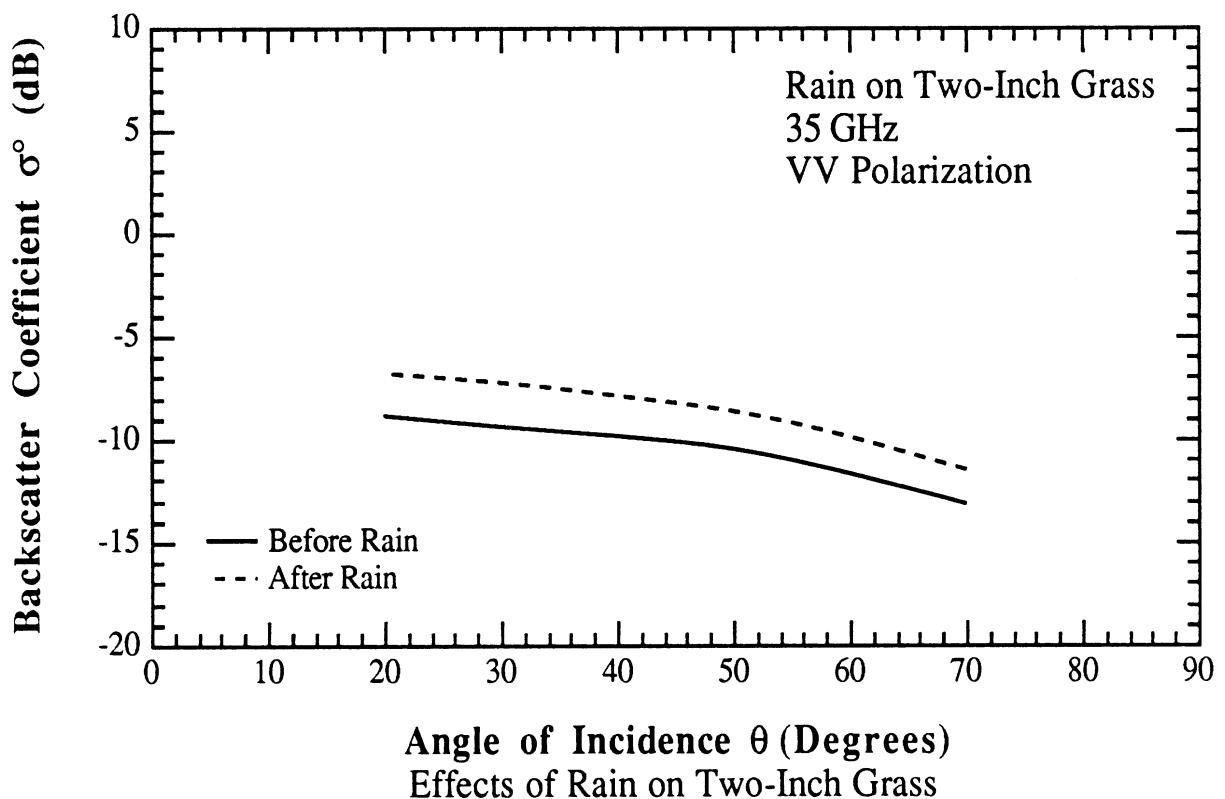

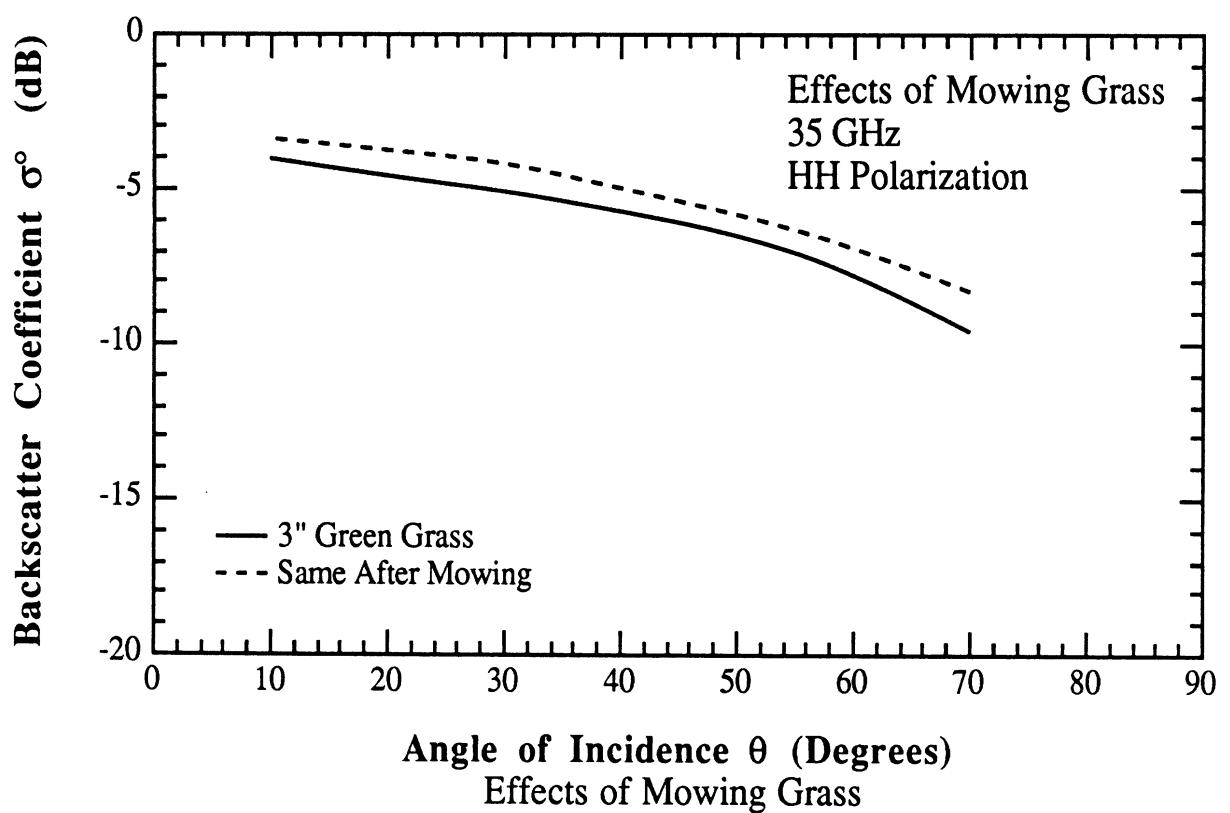

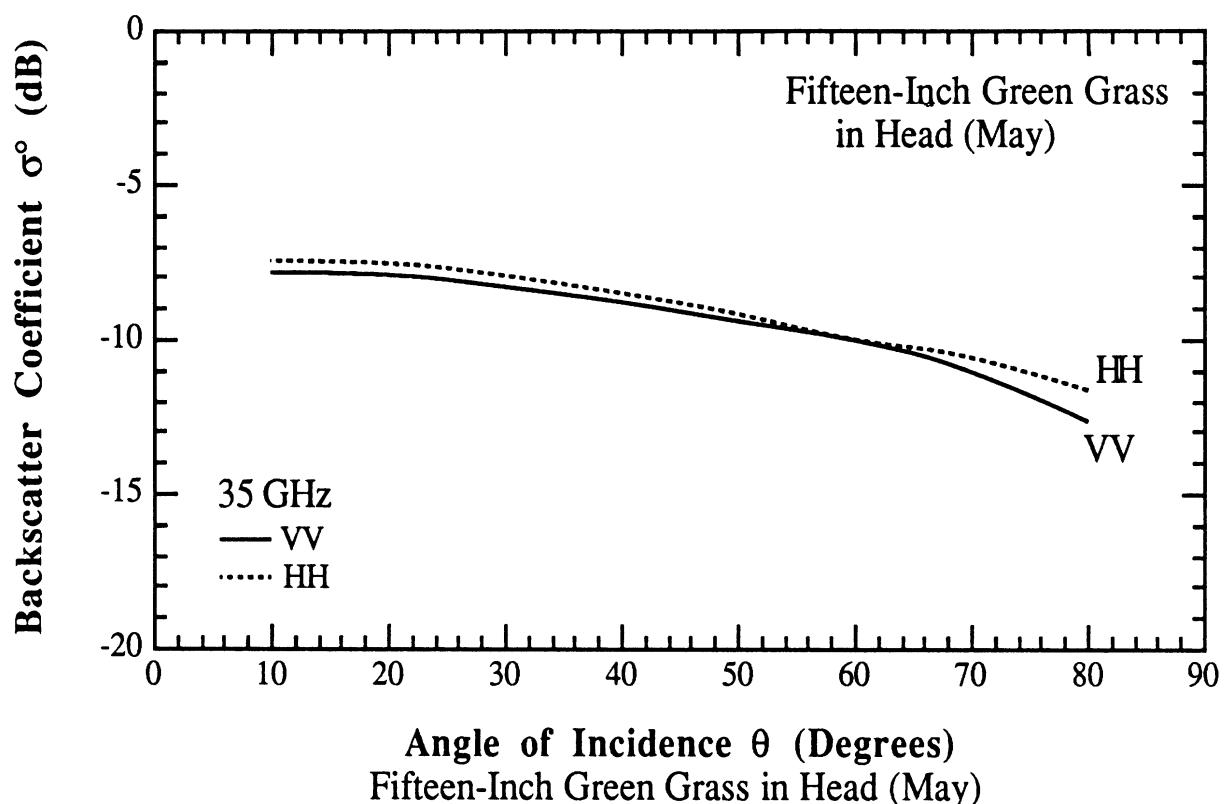

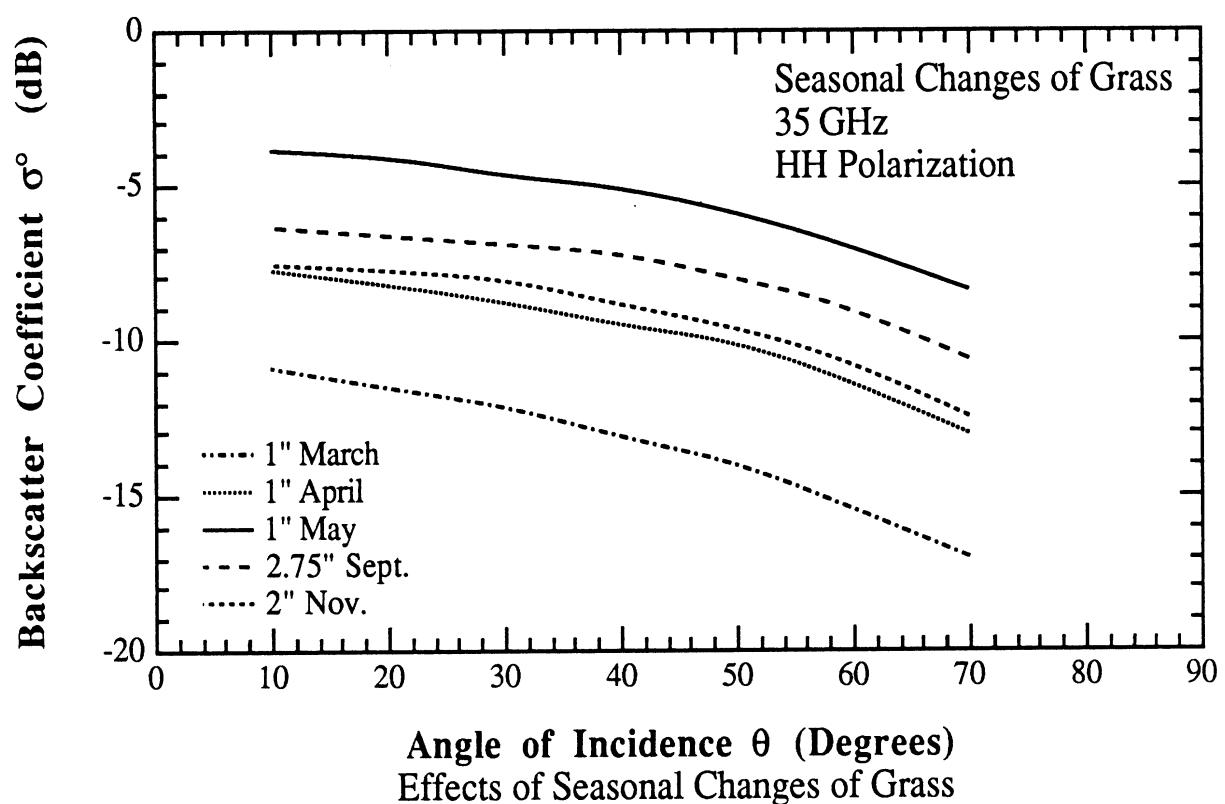

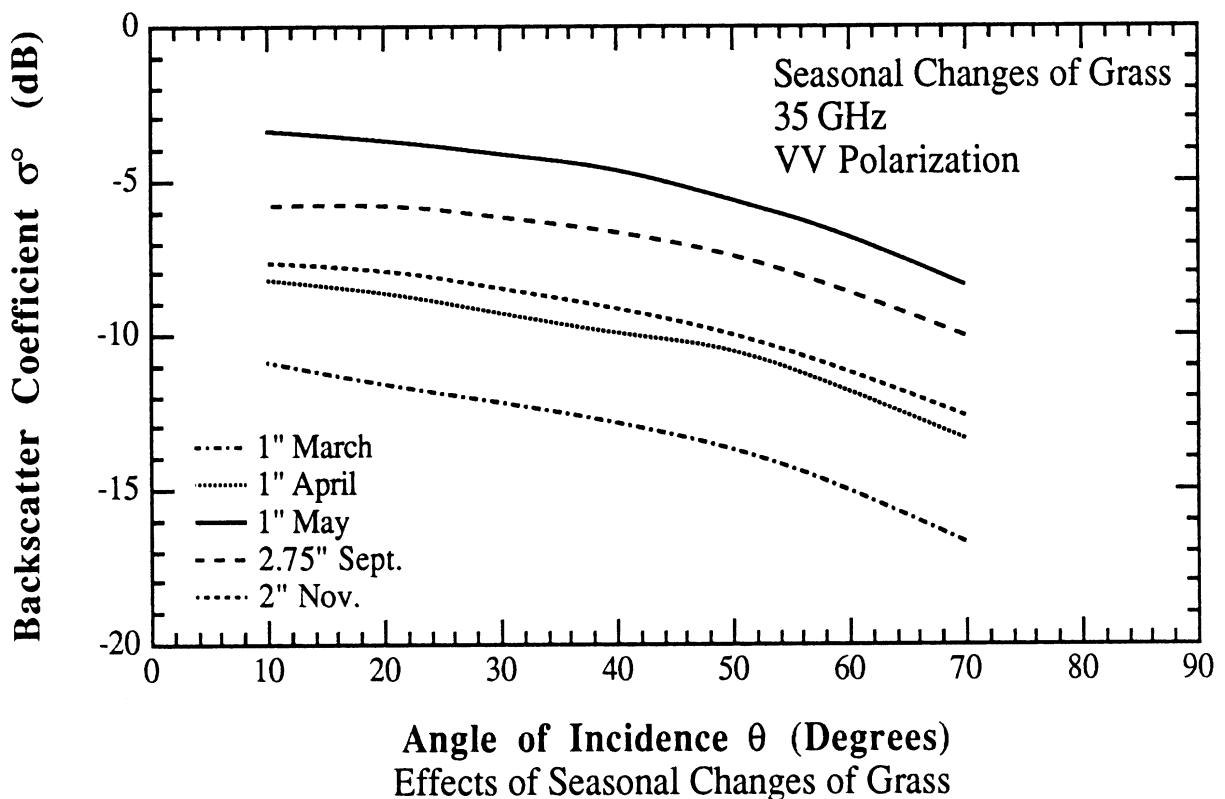

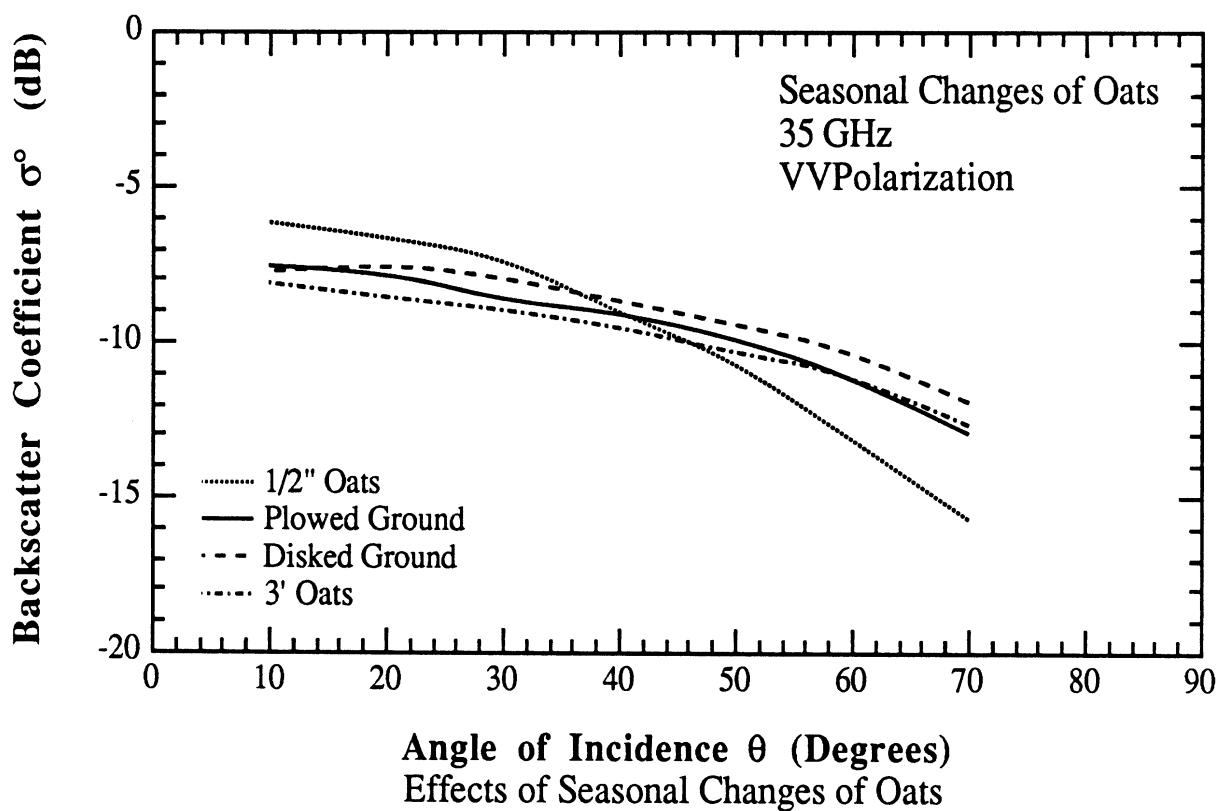

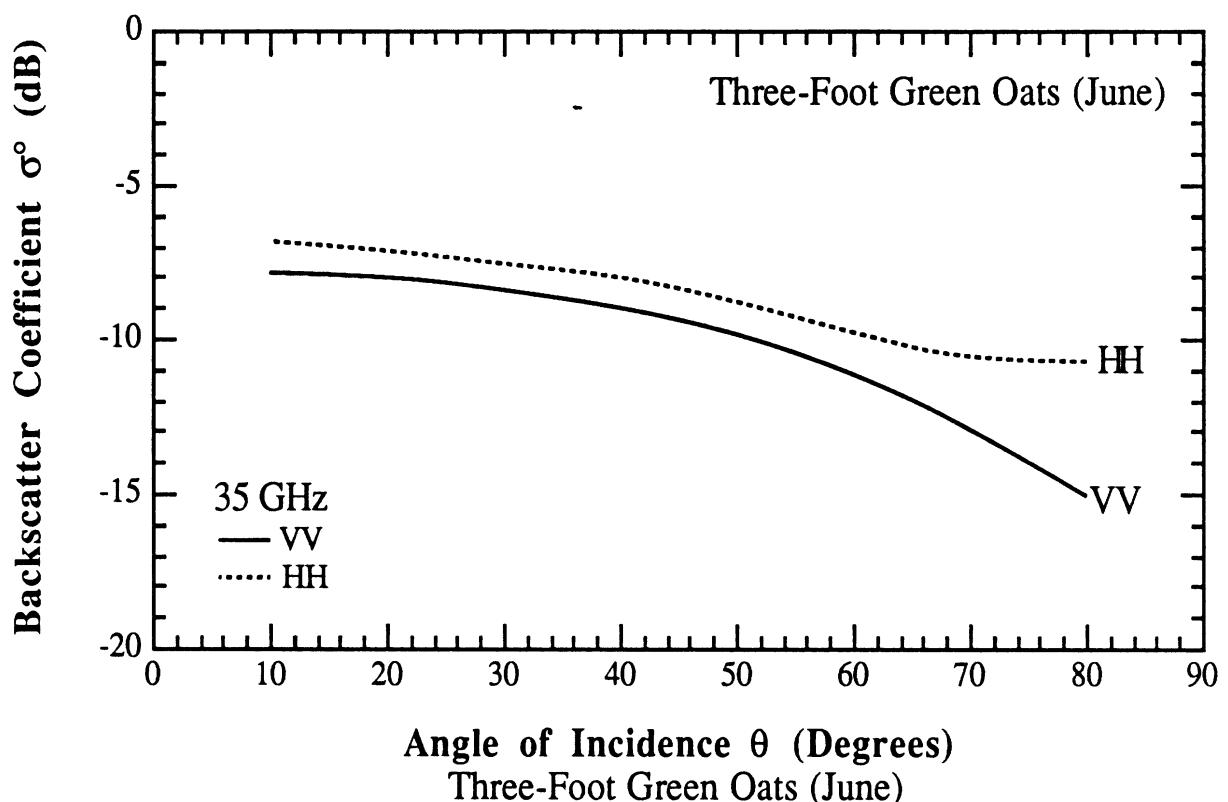

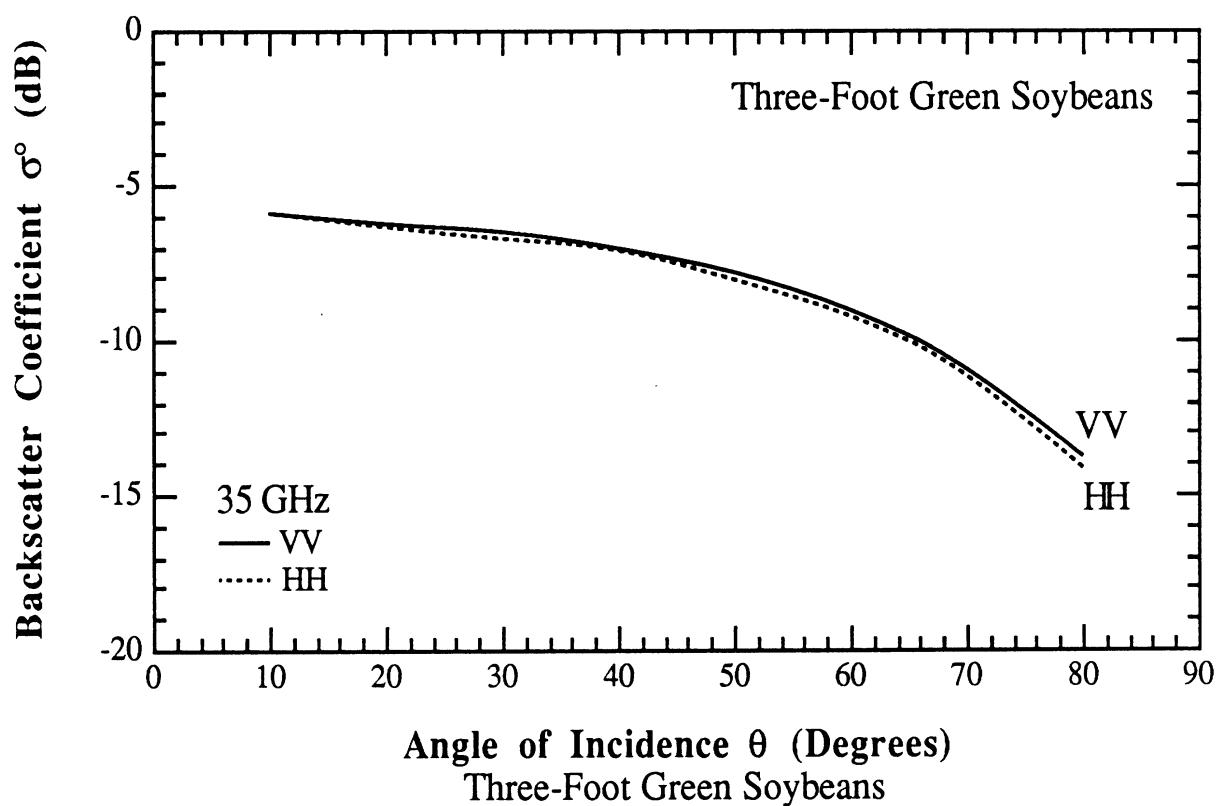

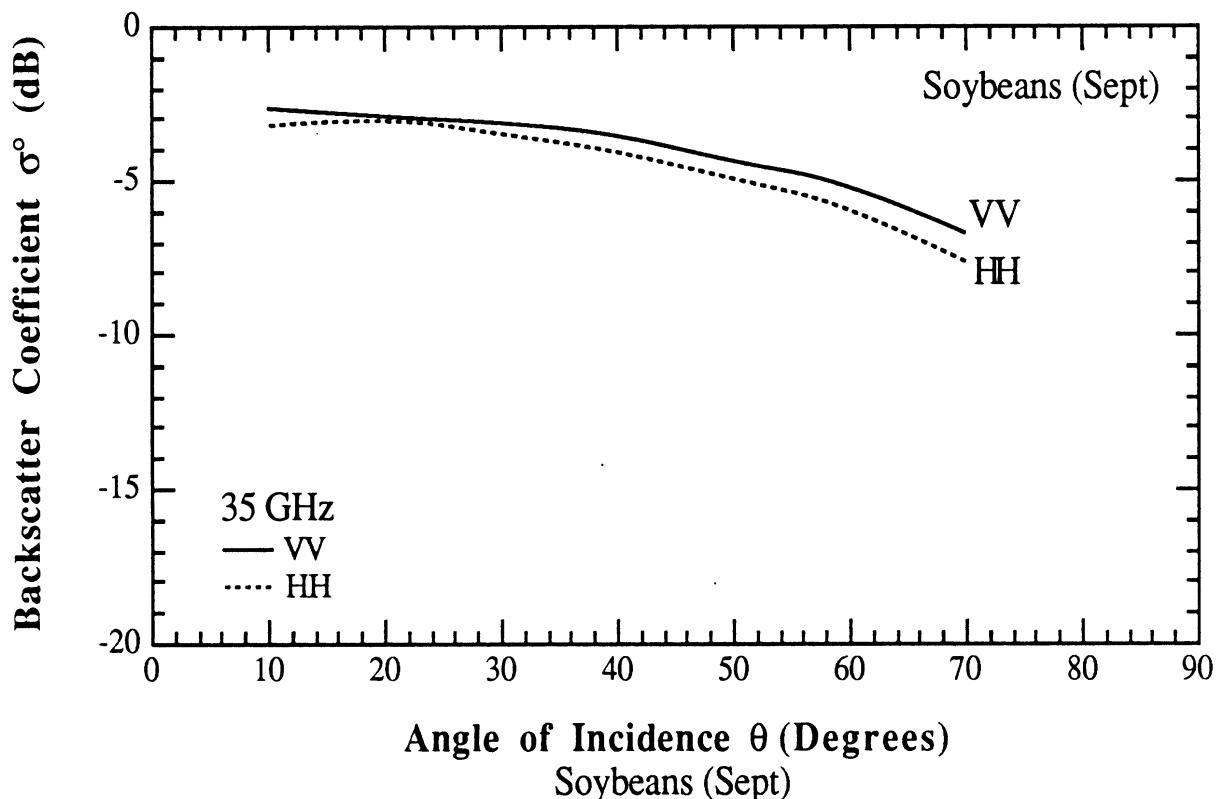

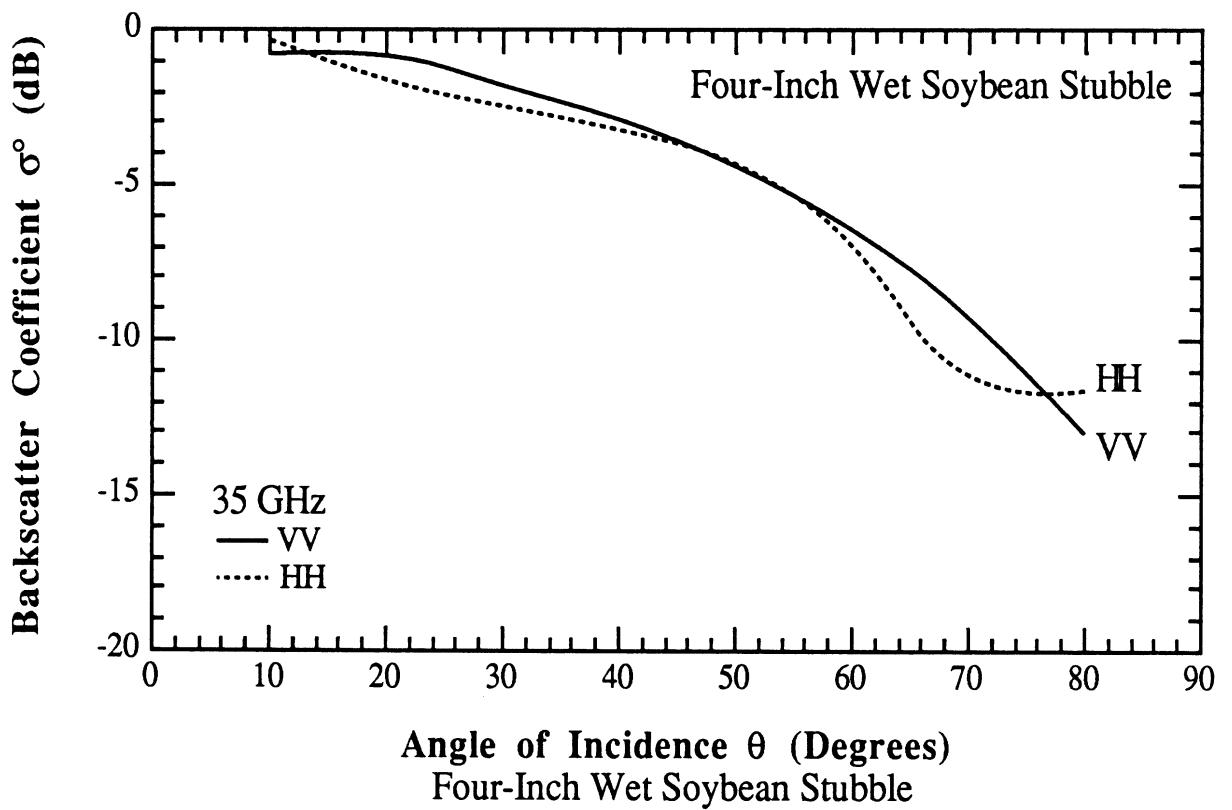

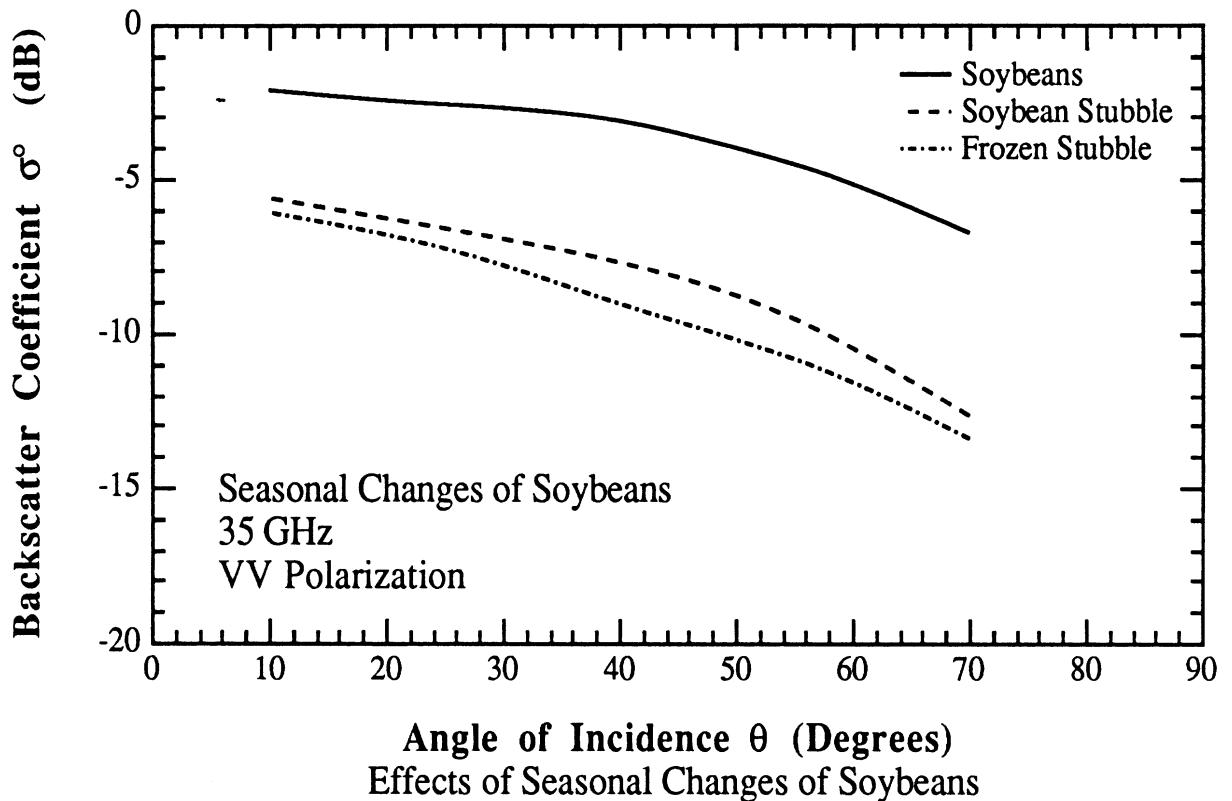

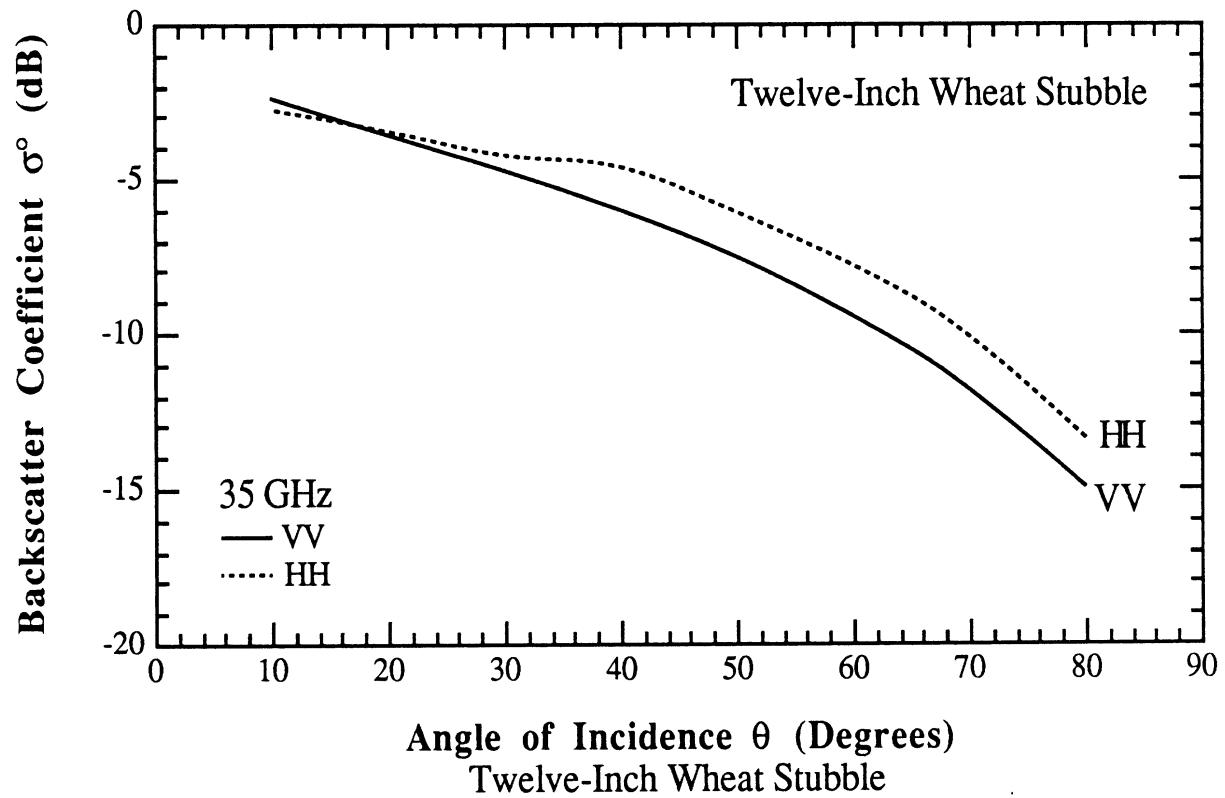

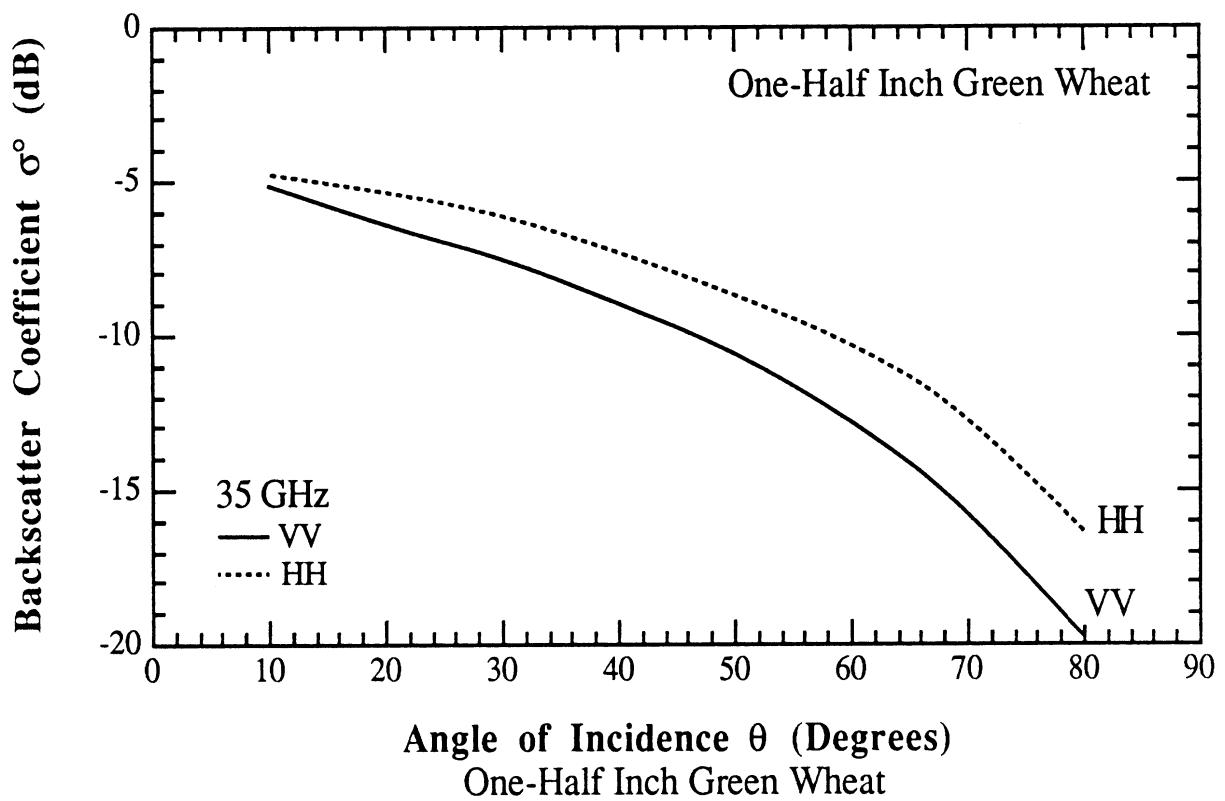

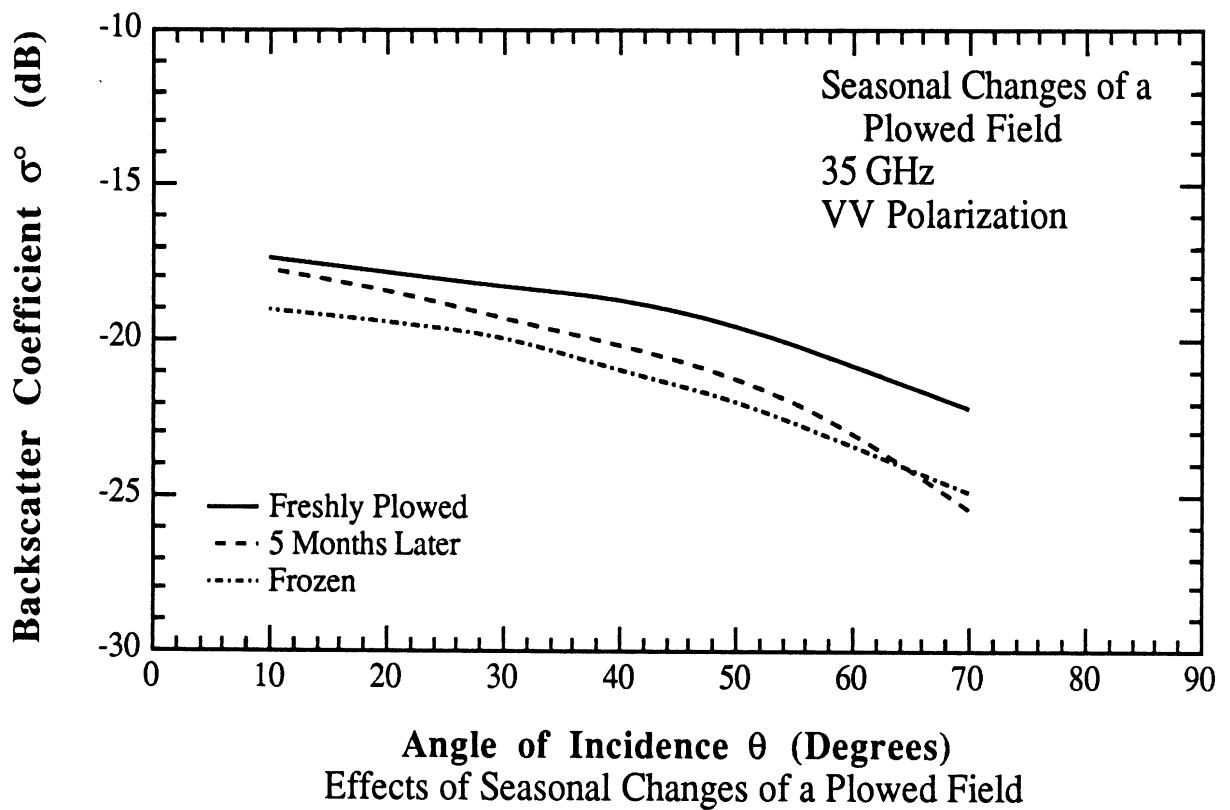

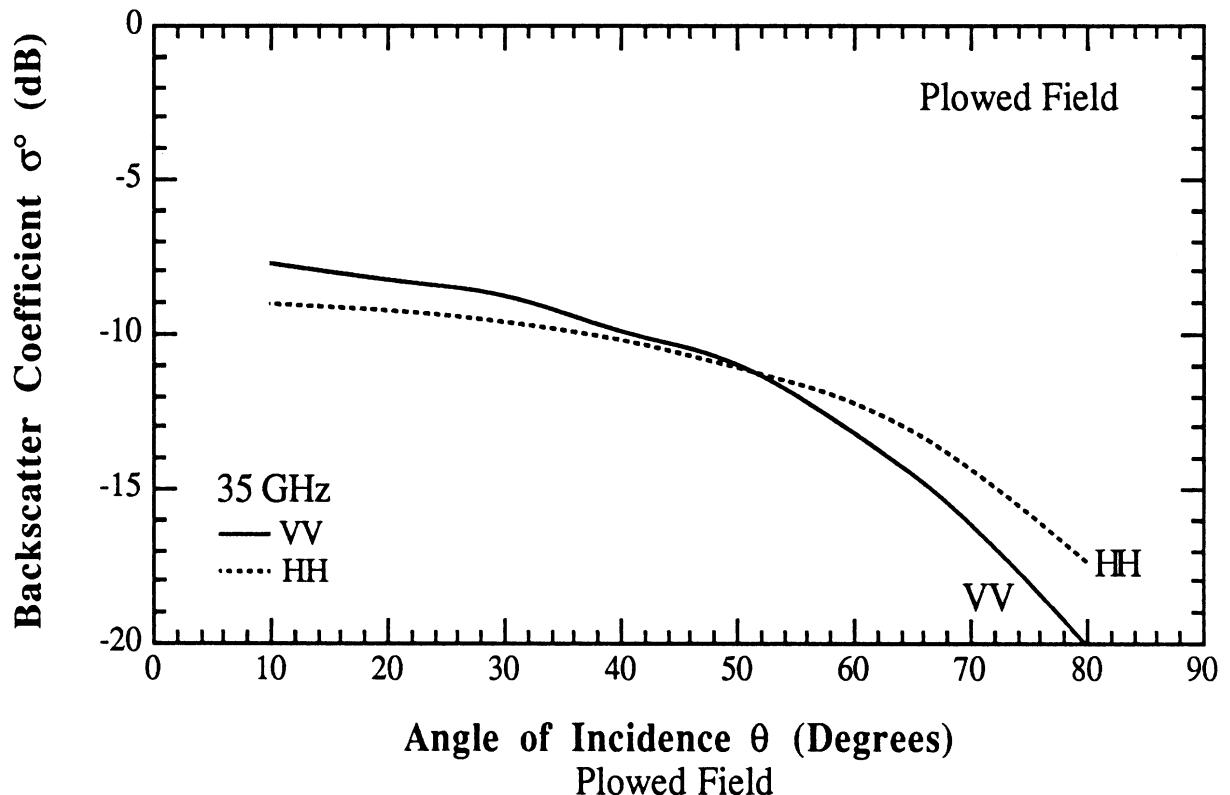

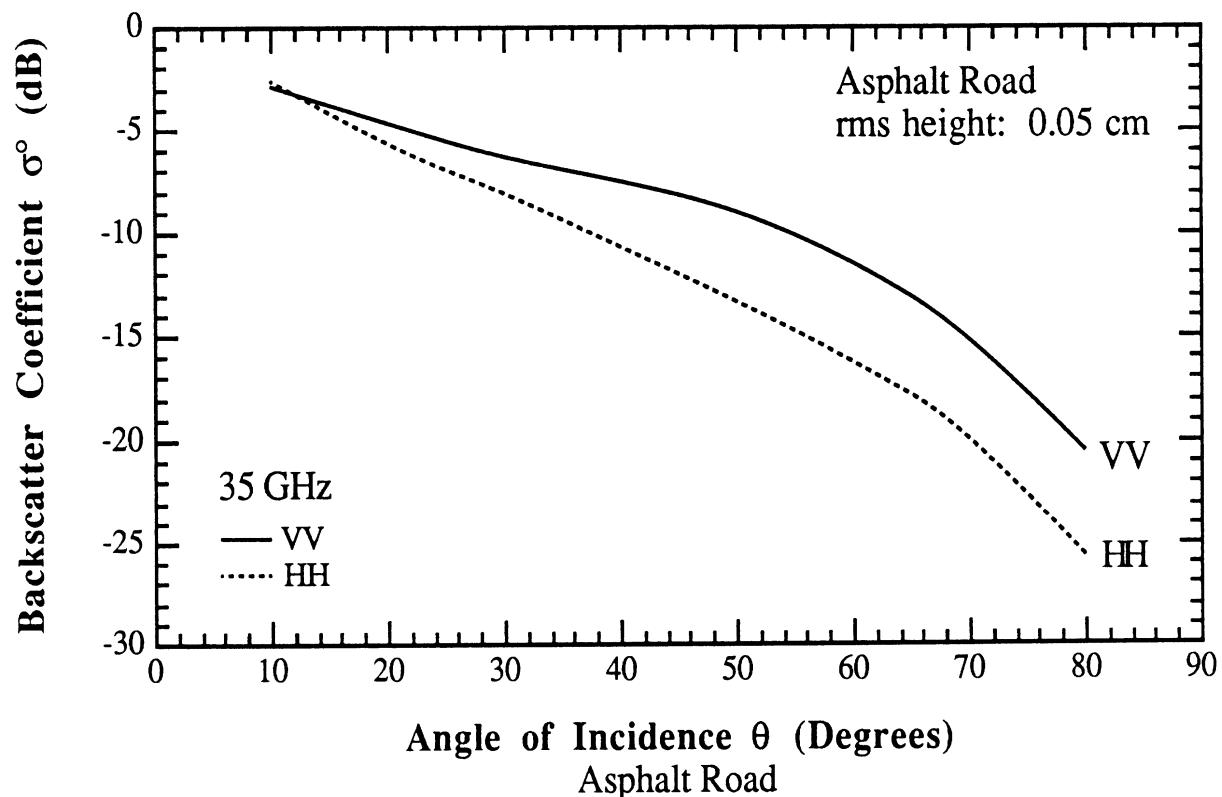

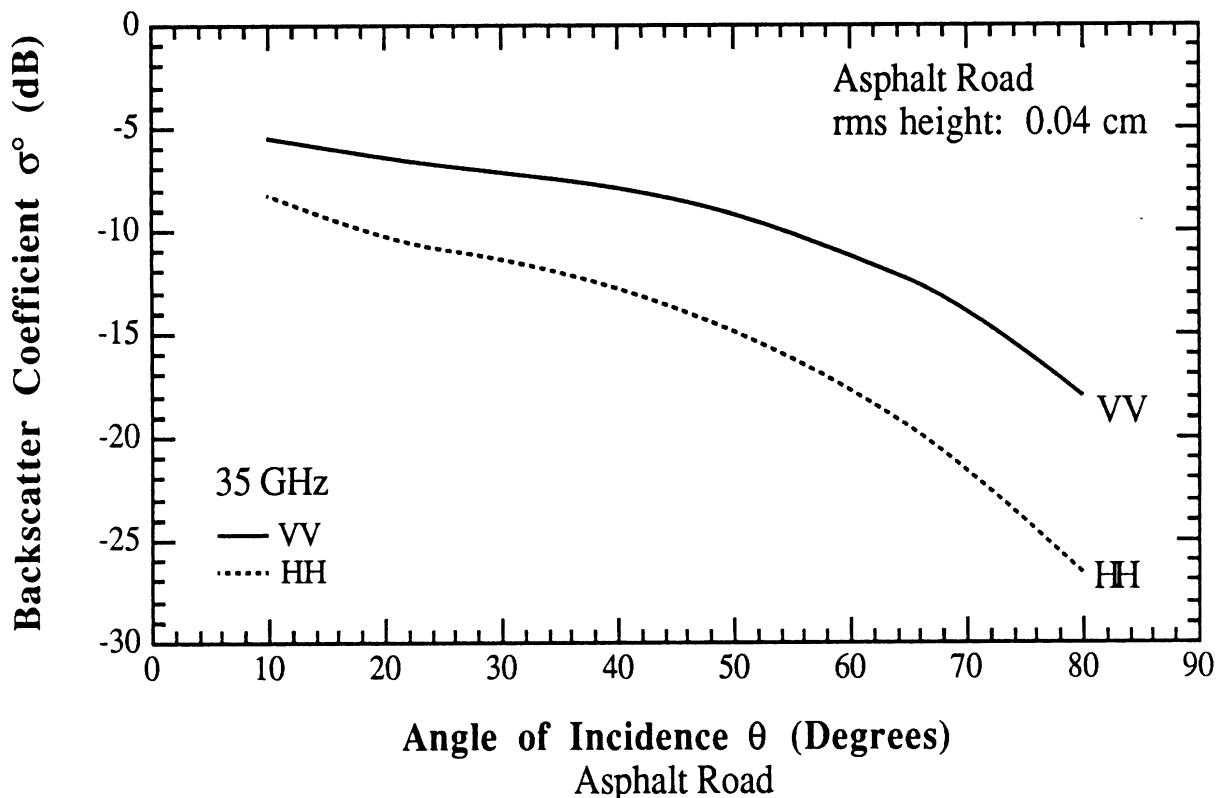

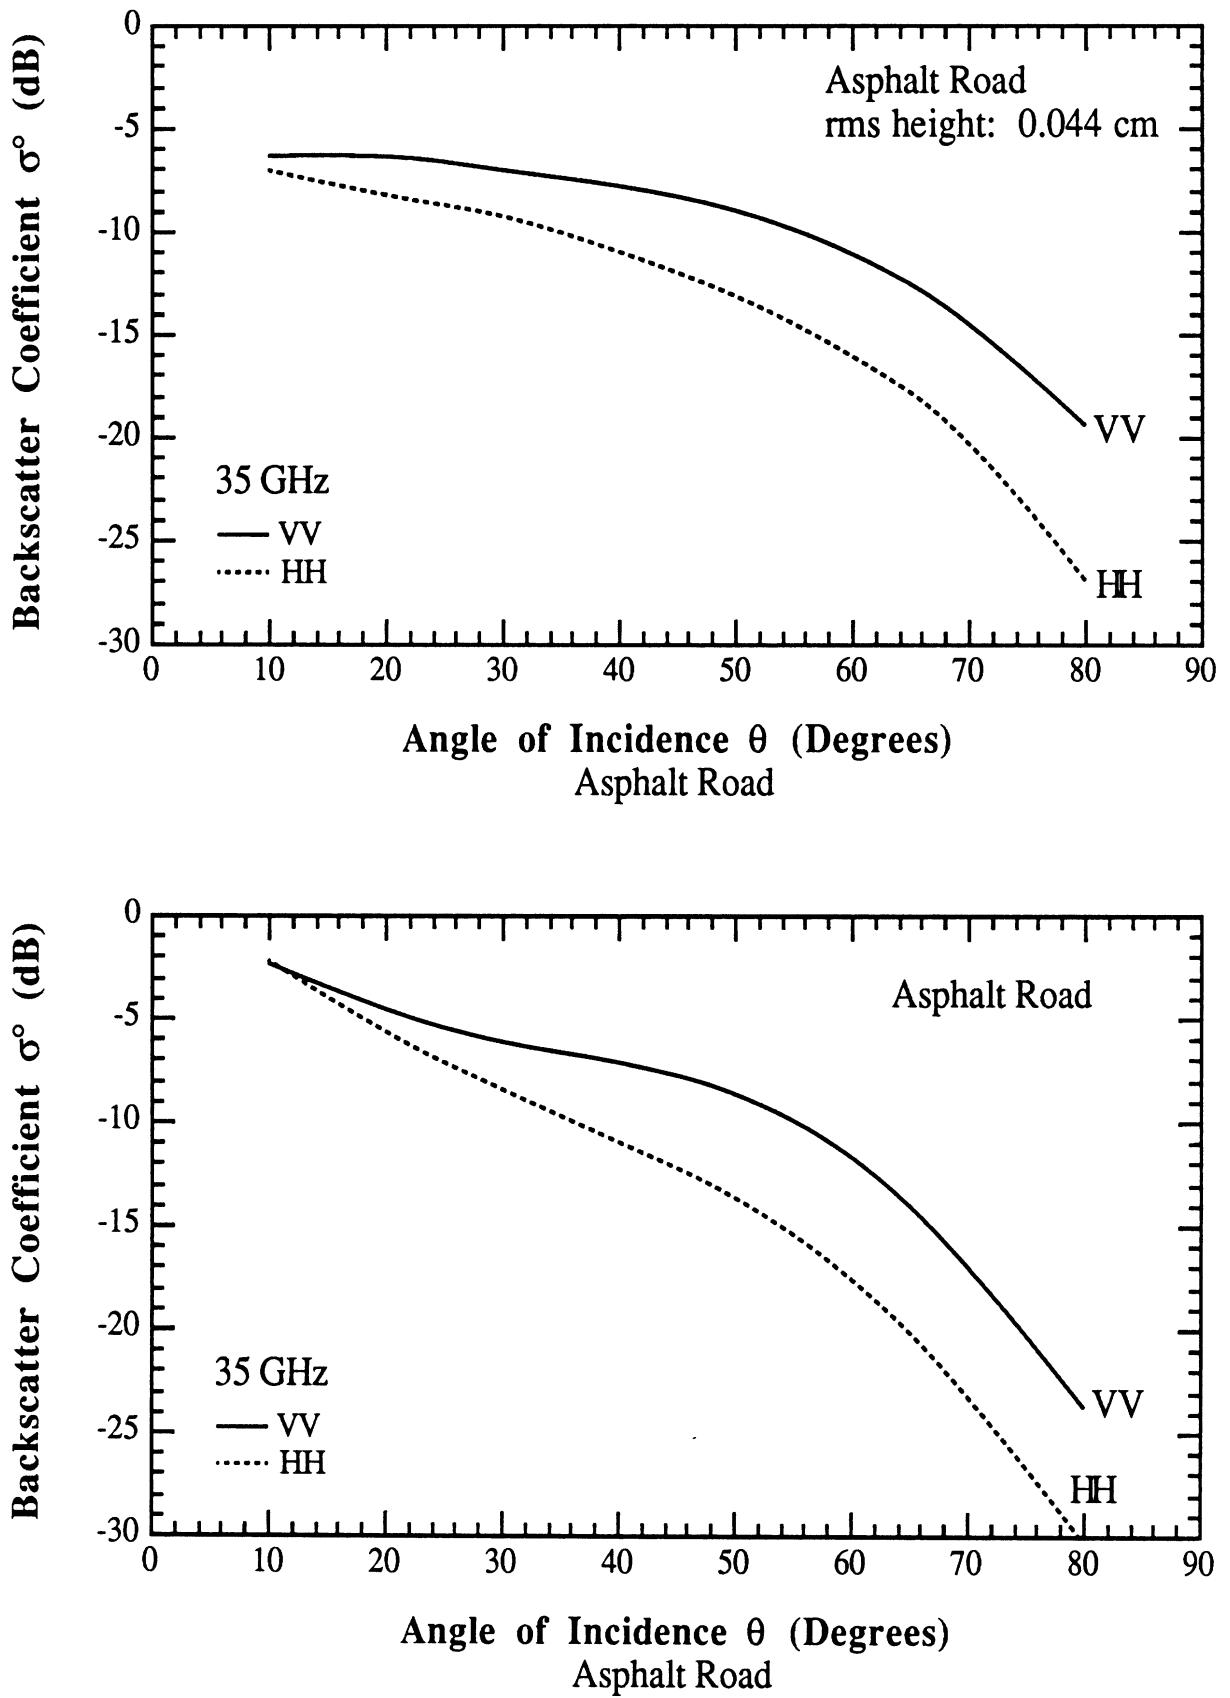

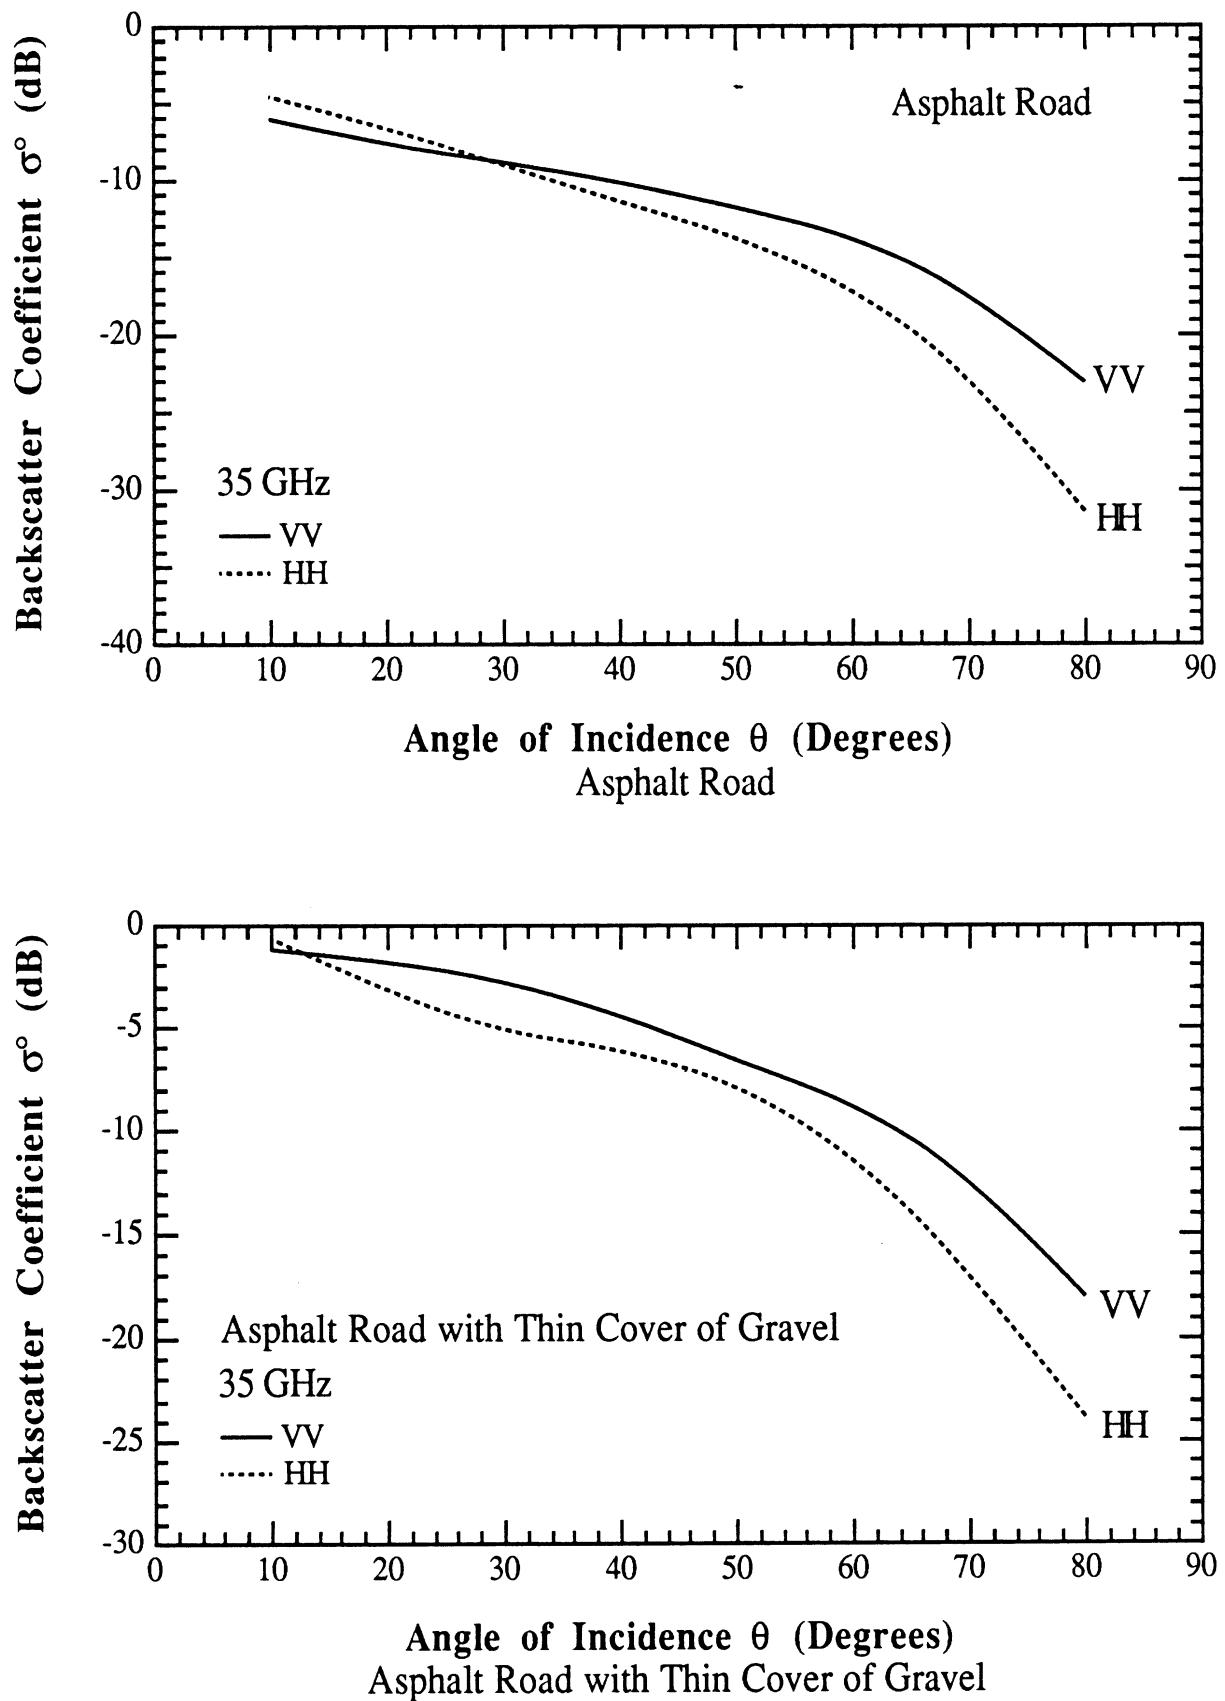

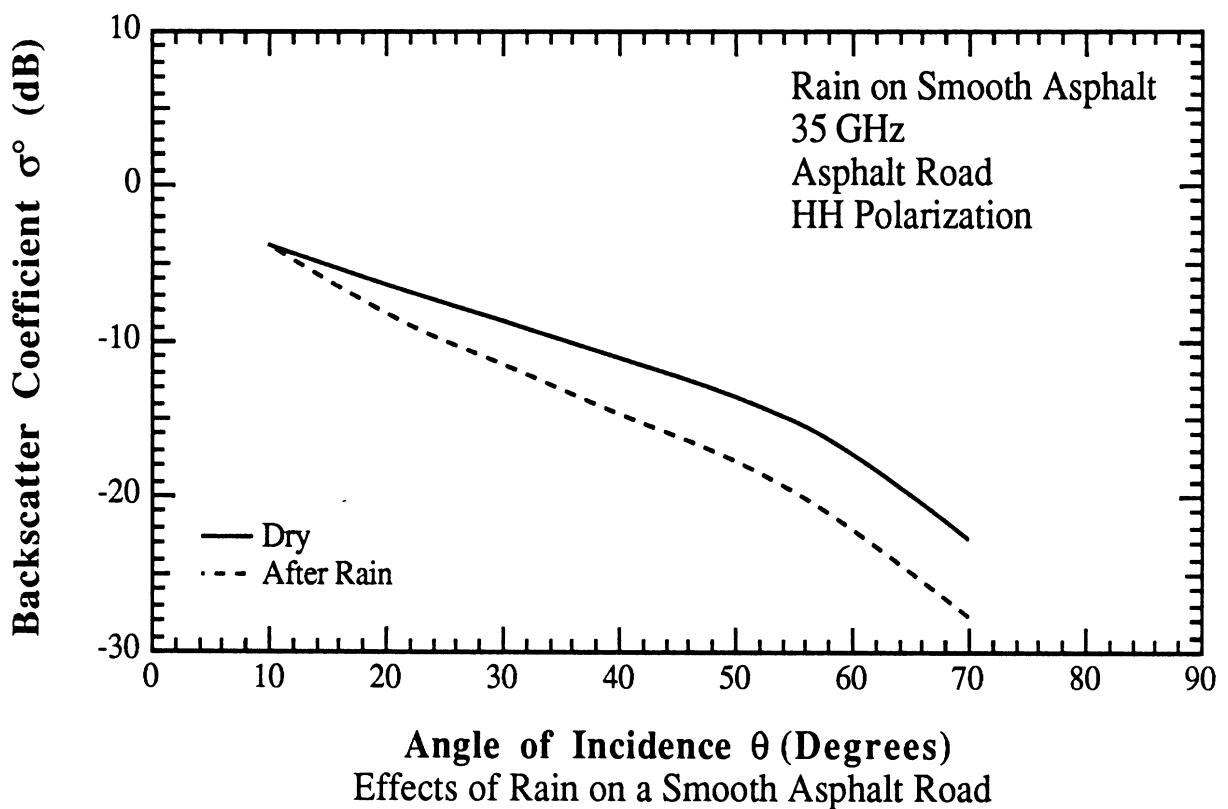

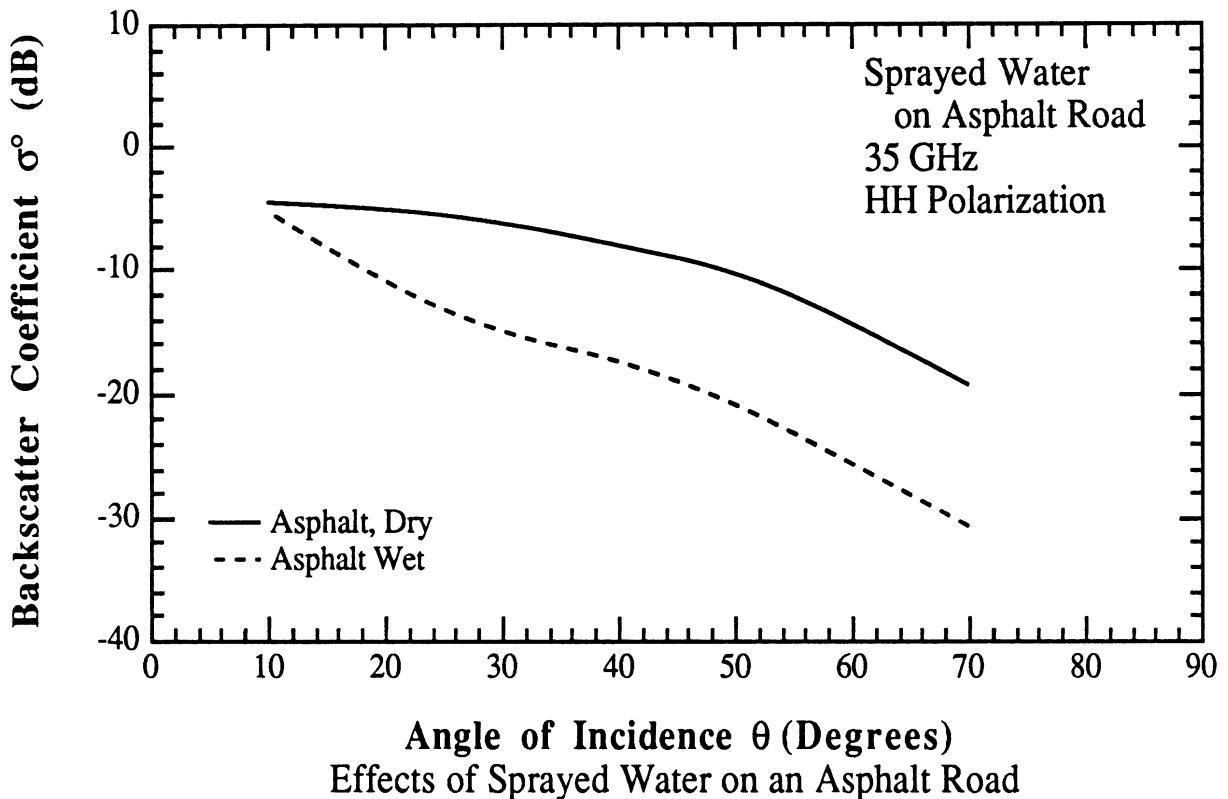

## 15. 35 GHz DATA FOR ROAD SURFACES

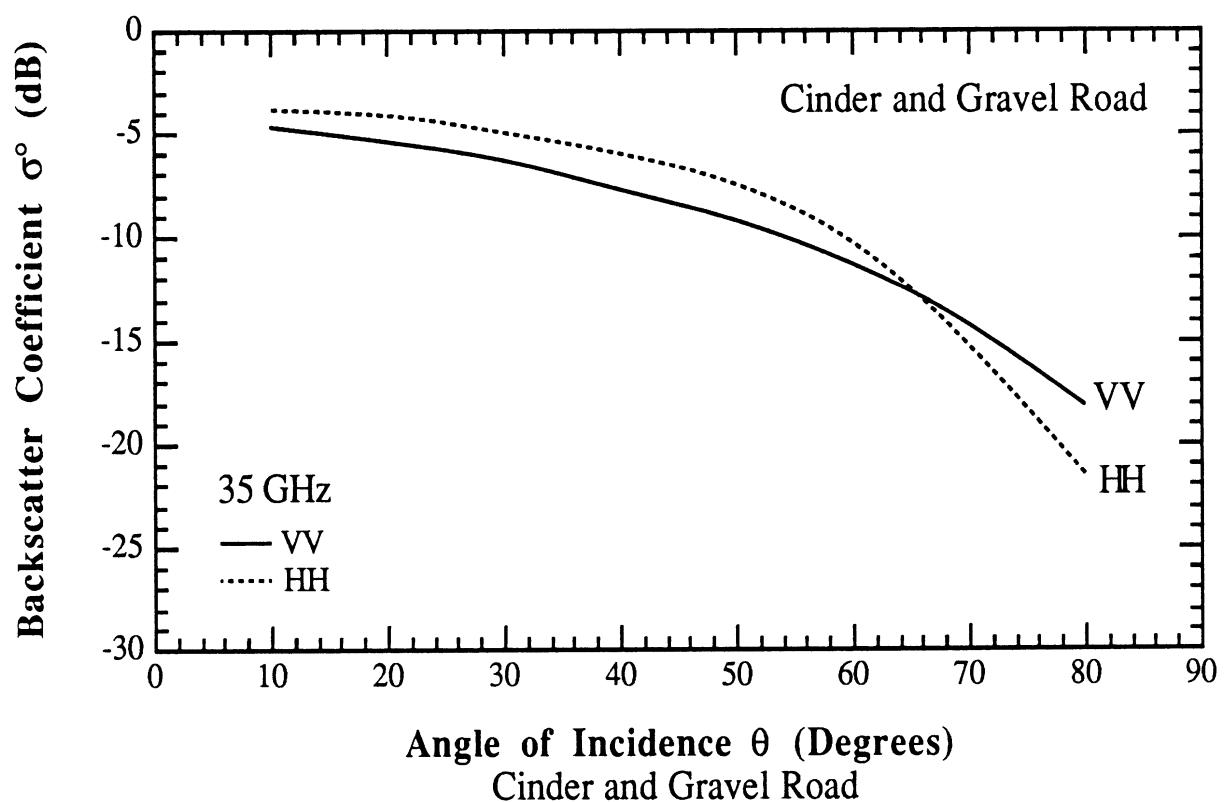

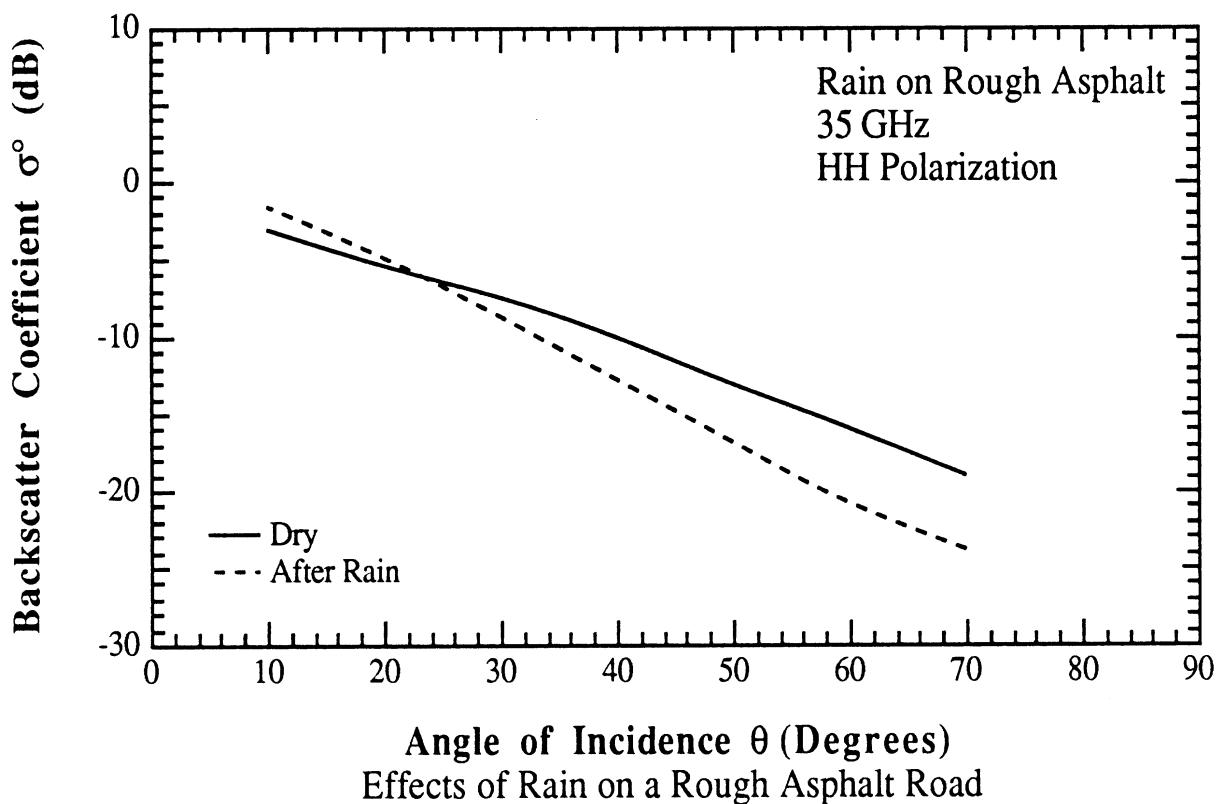

### A. Various Surfaces

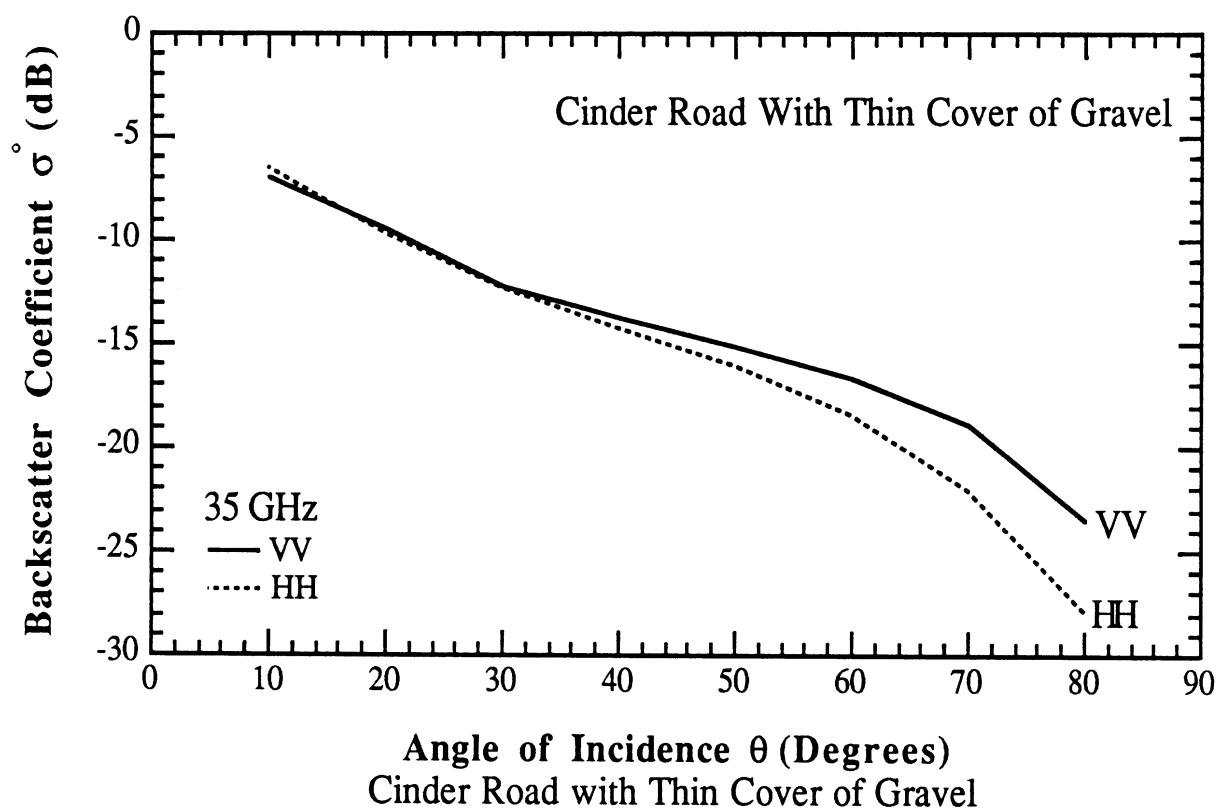

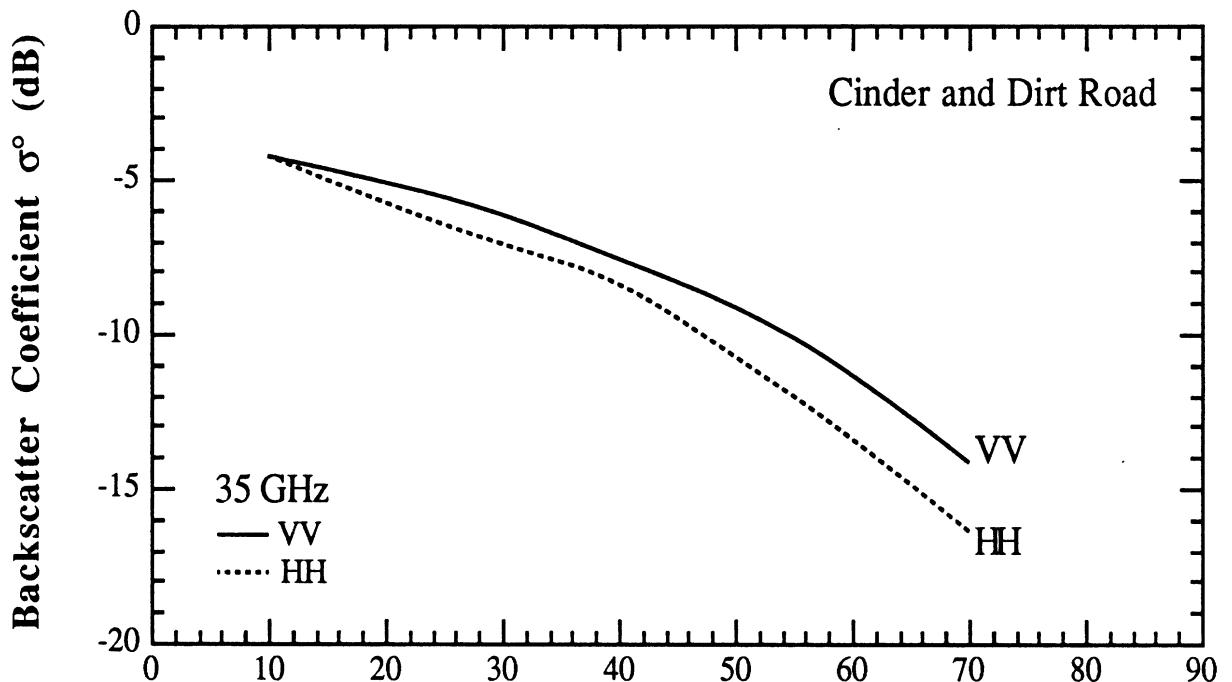

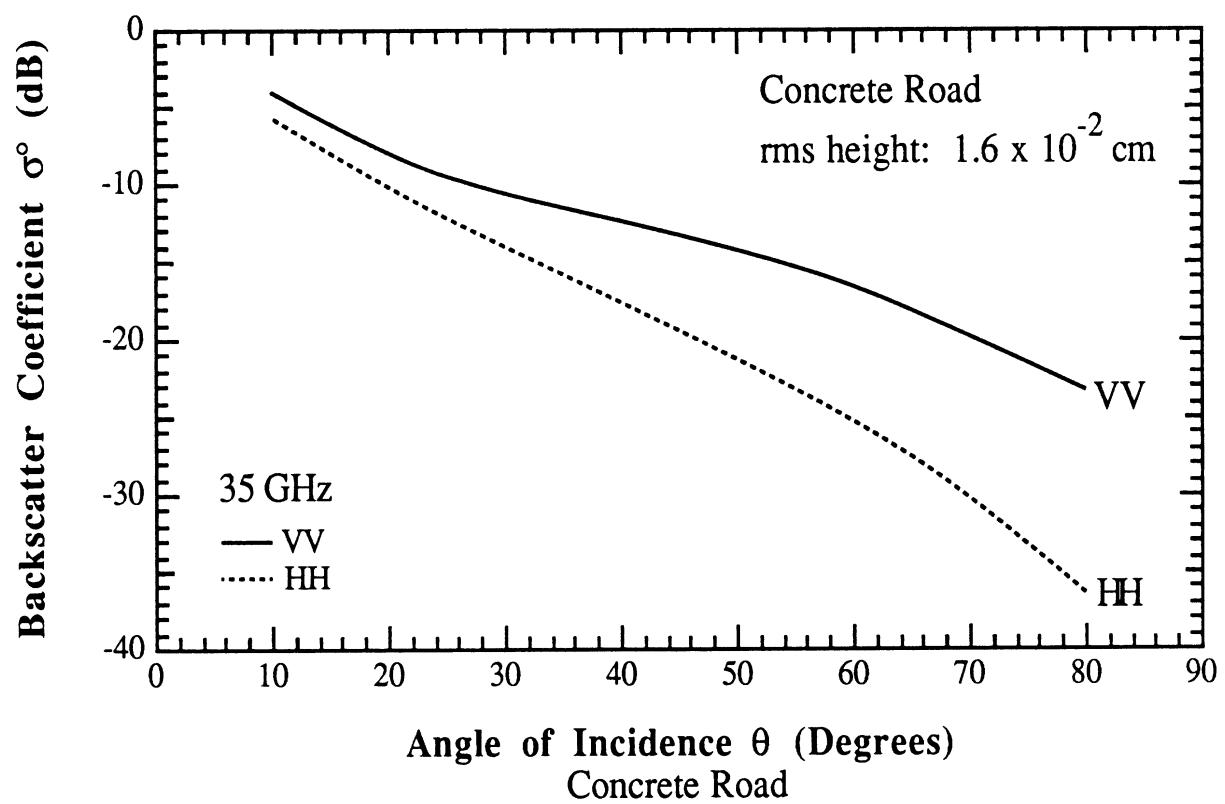

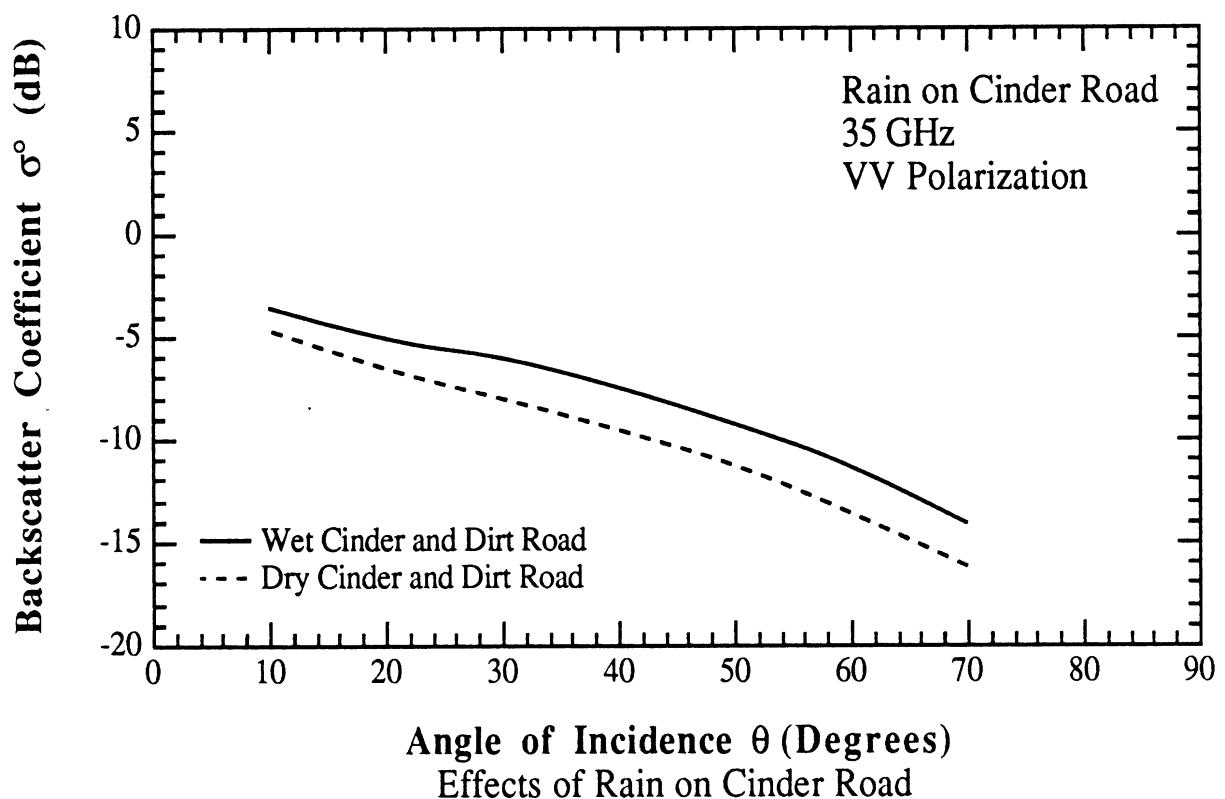

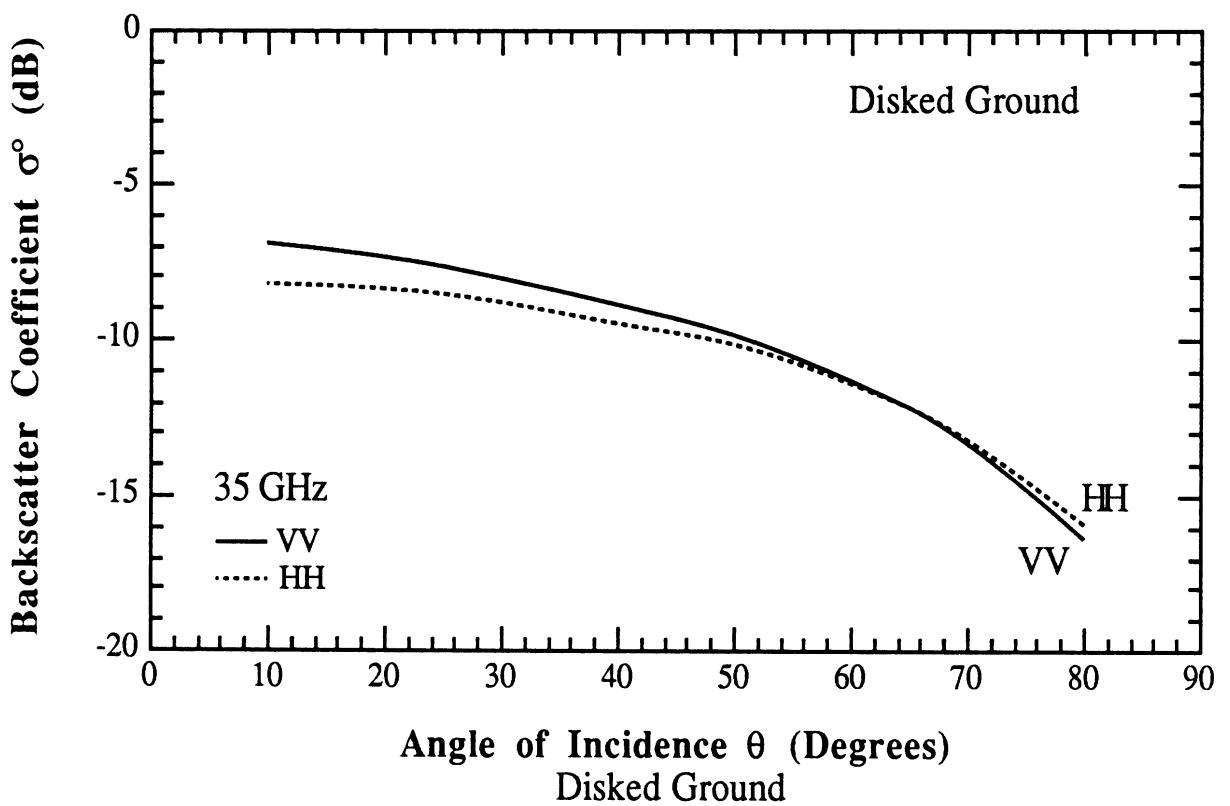

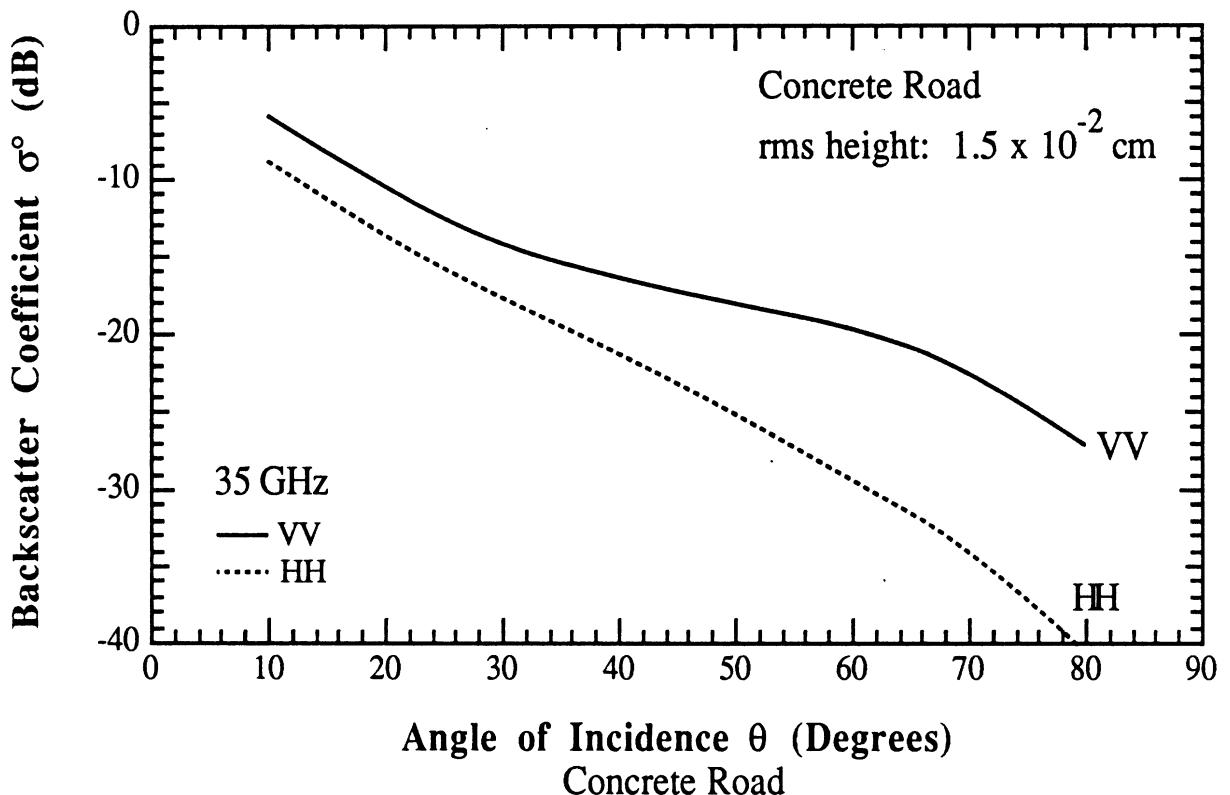

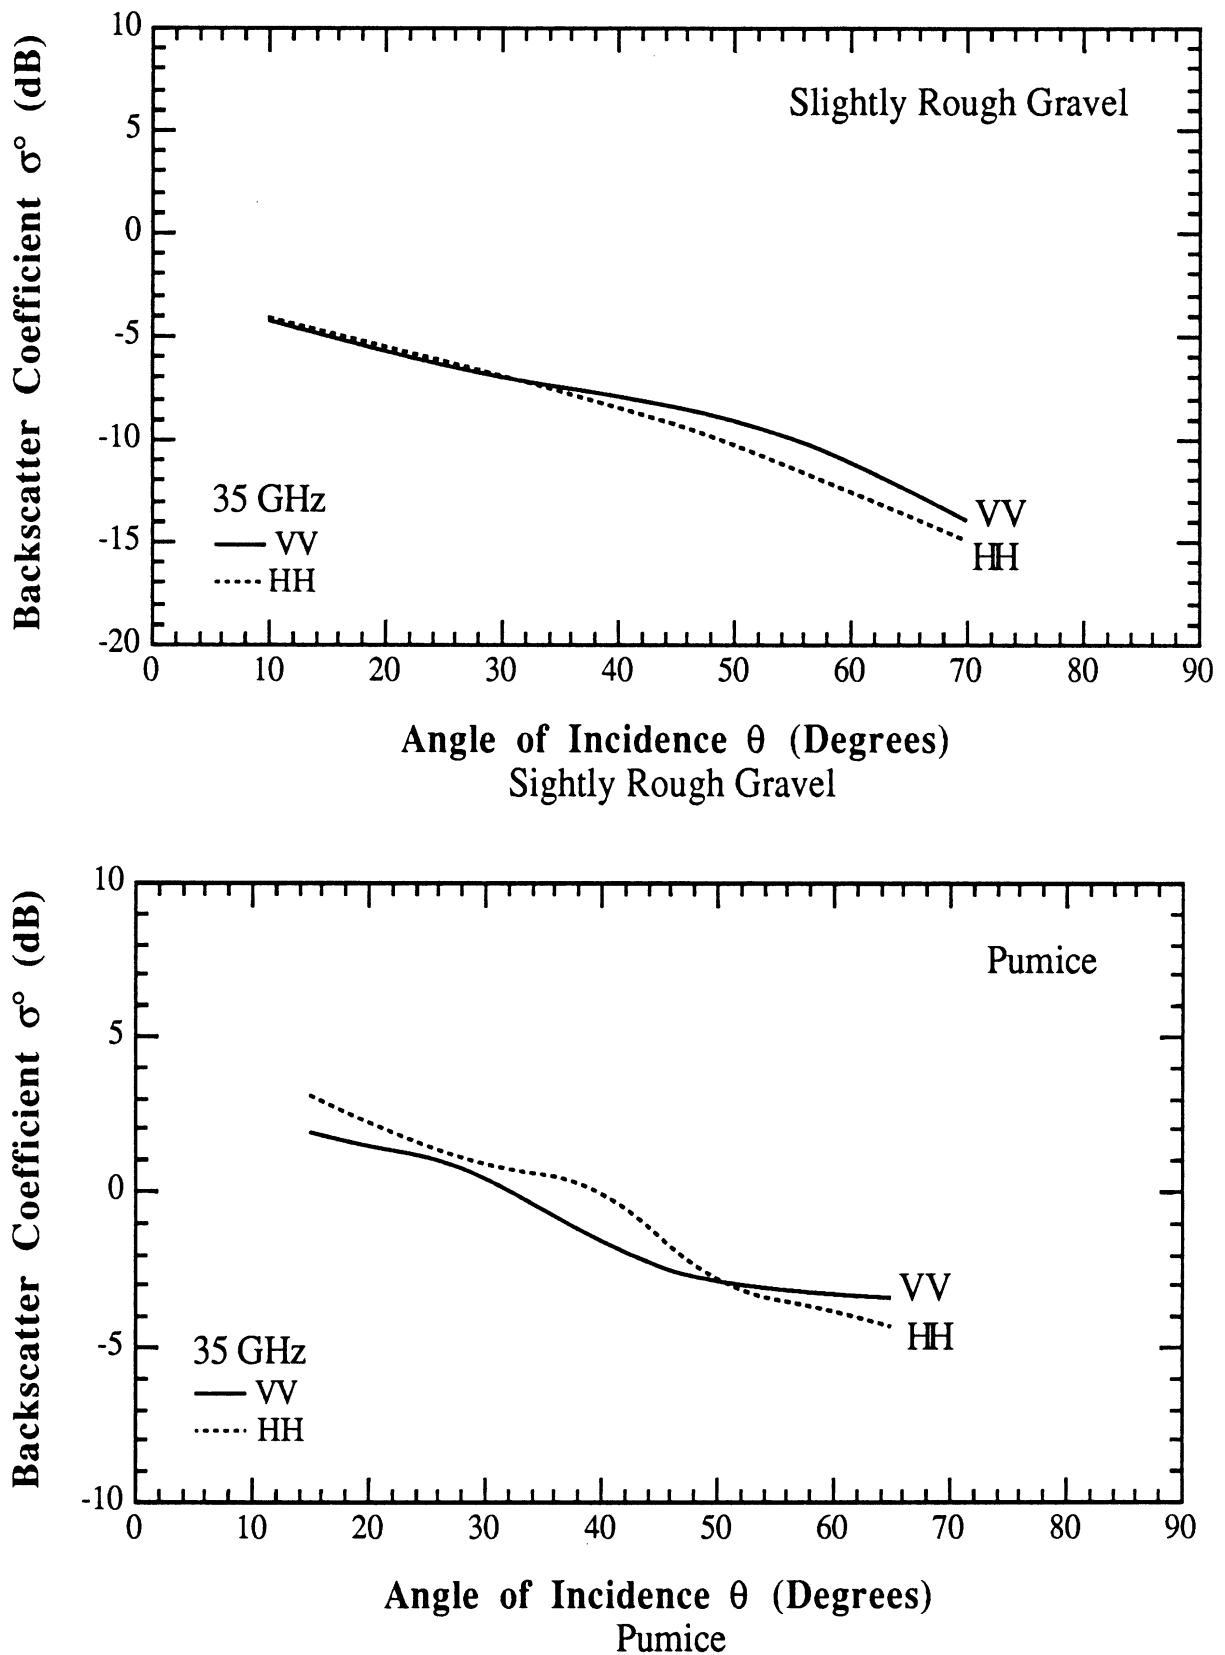

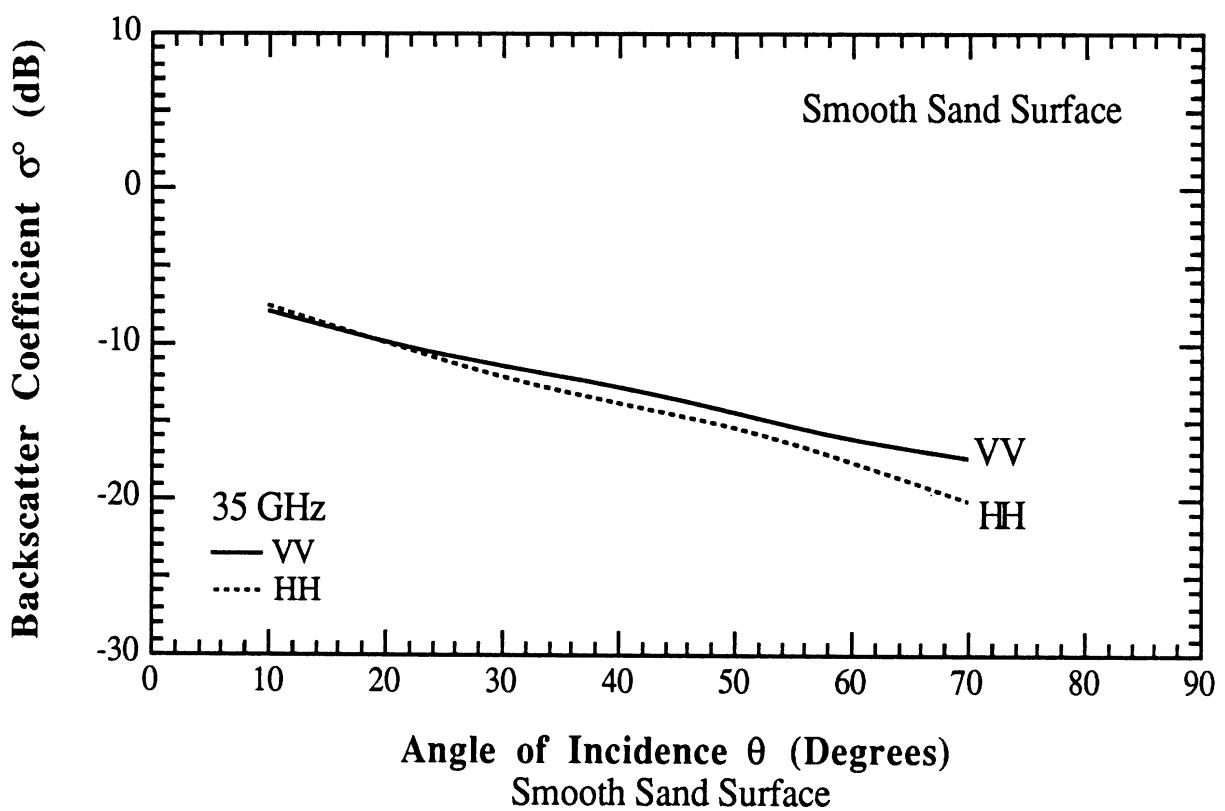

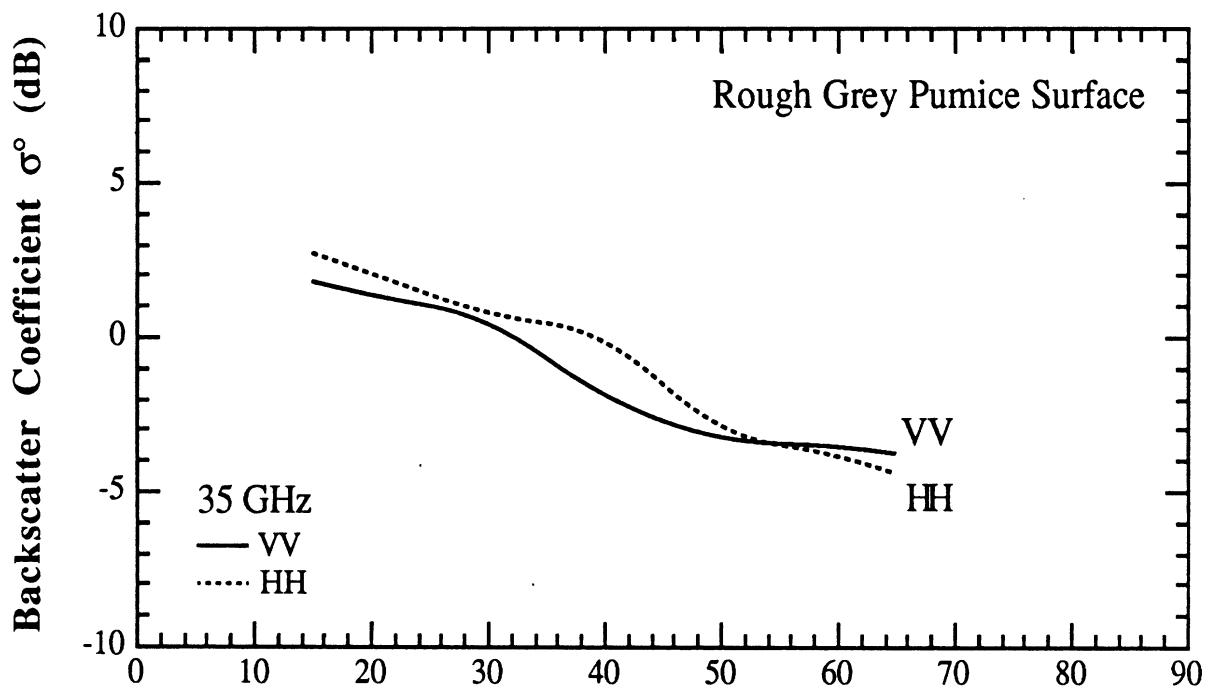

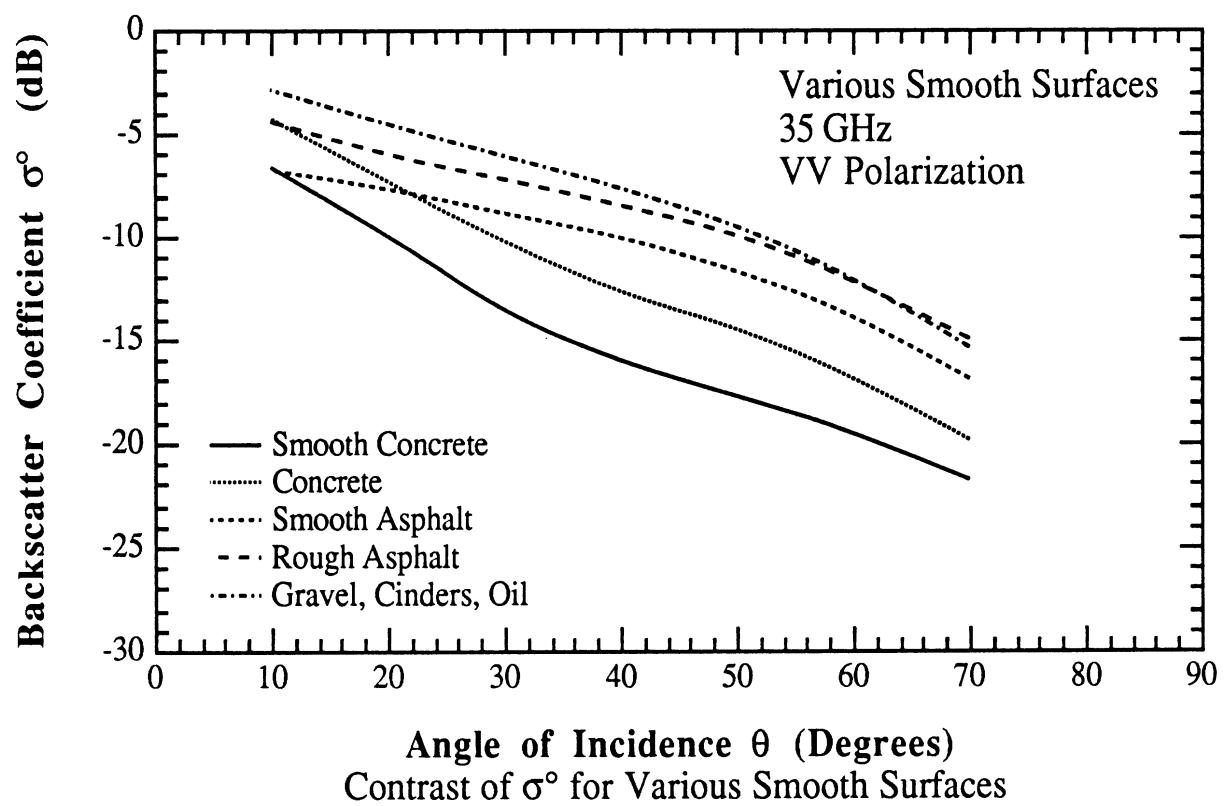

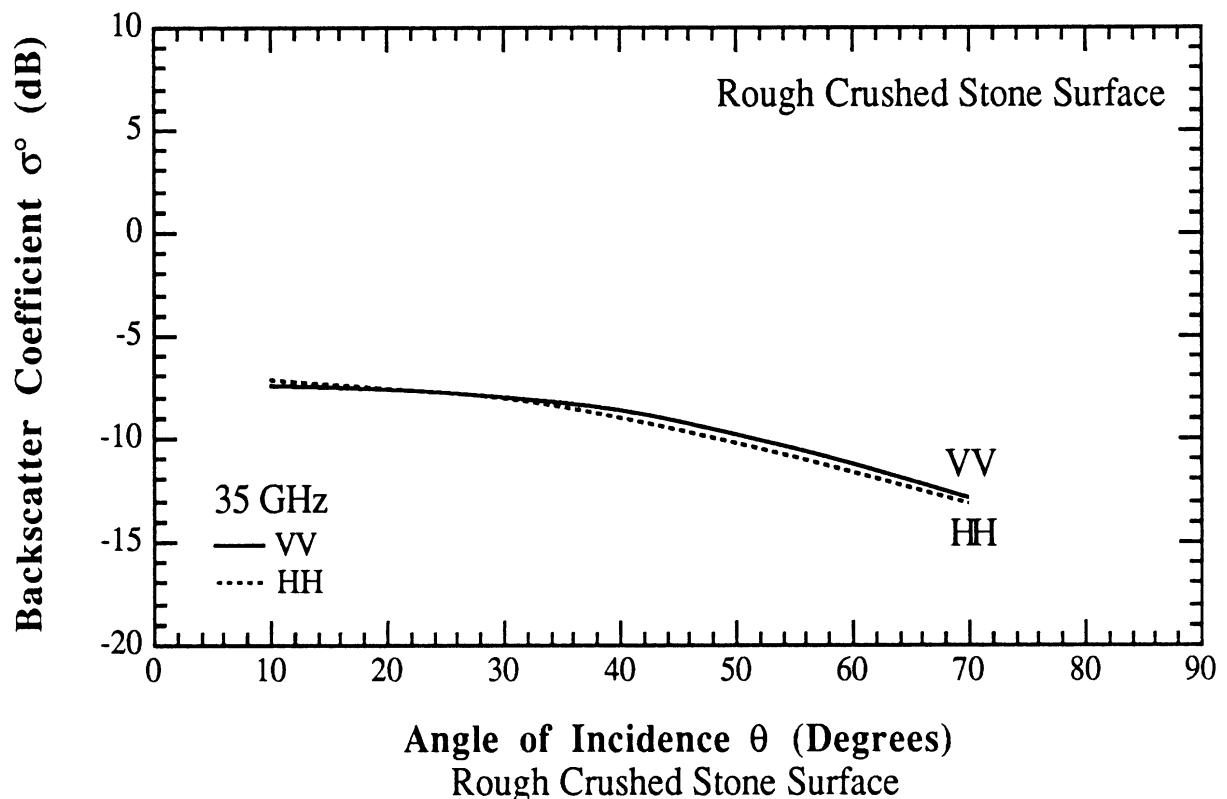

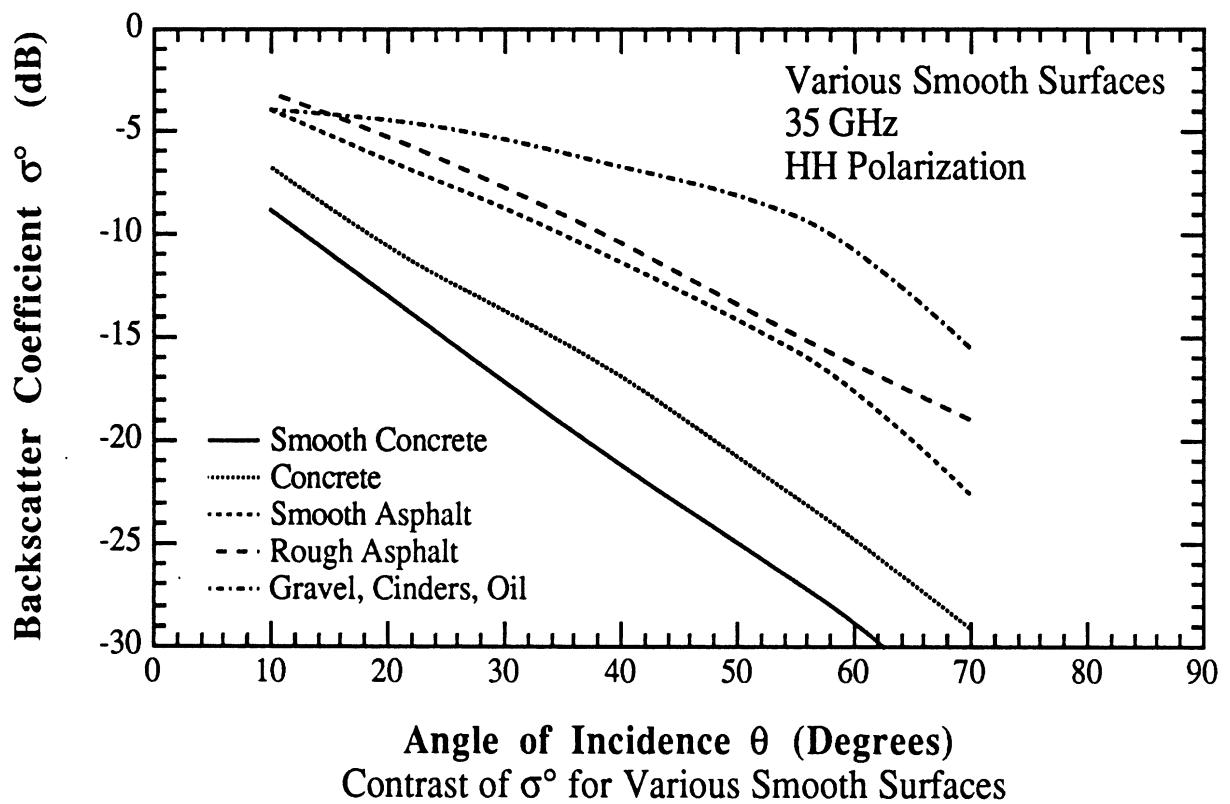

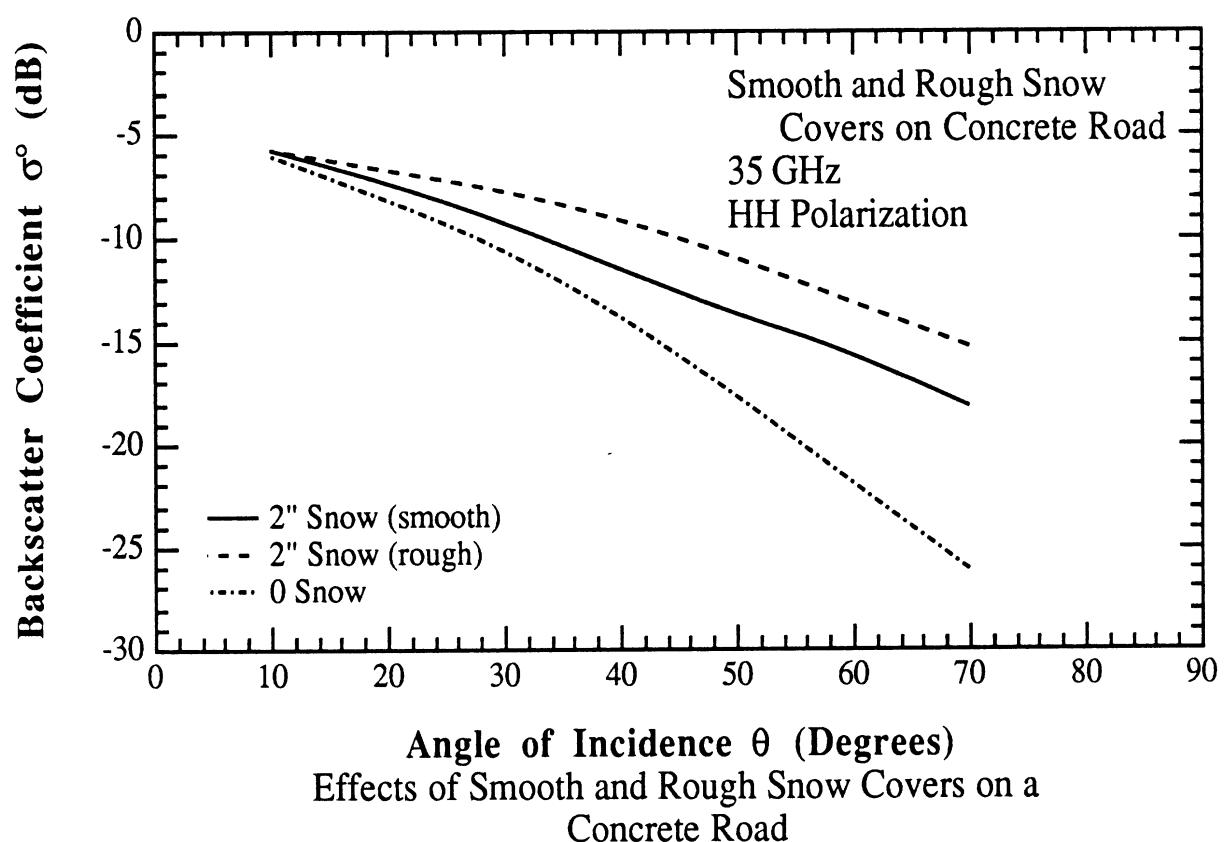

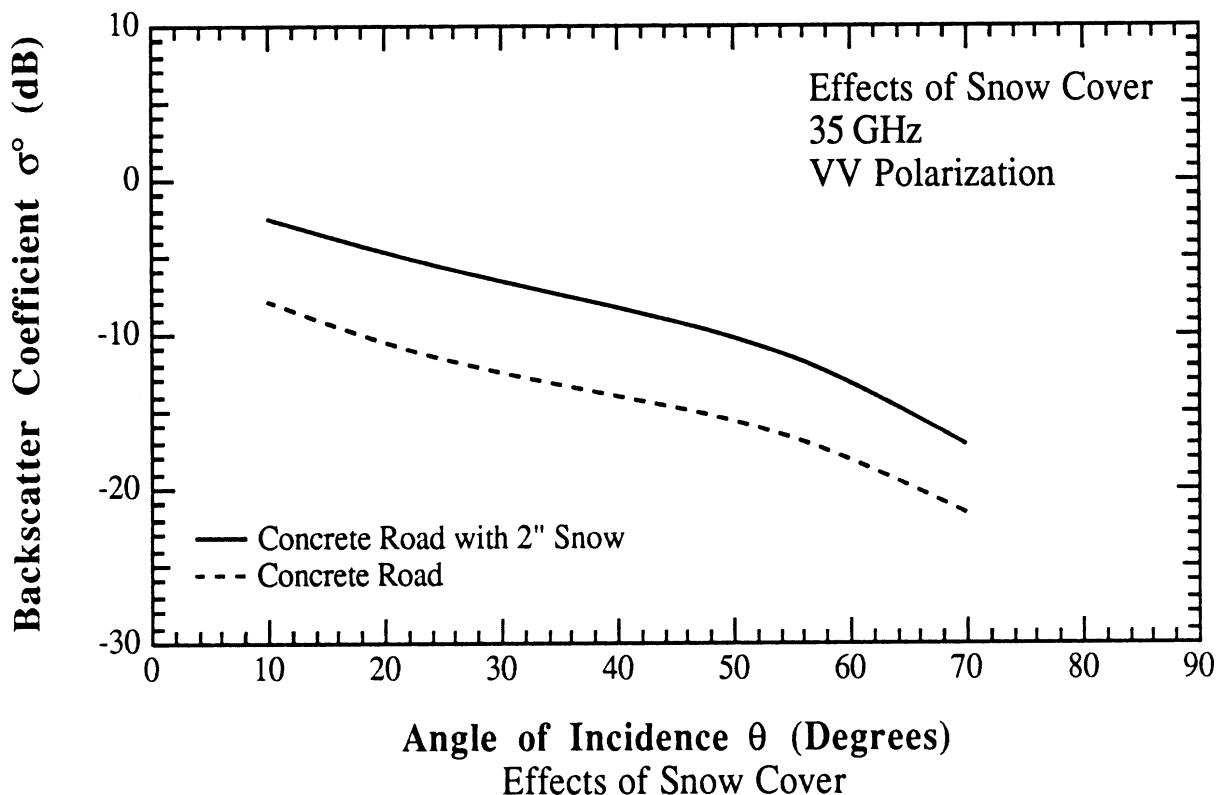

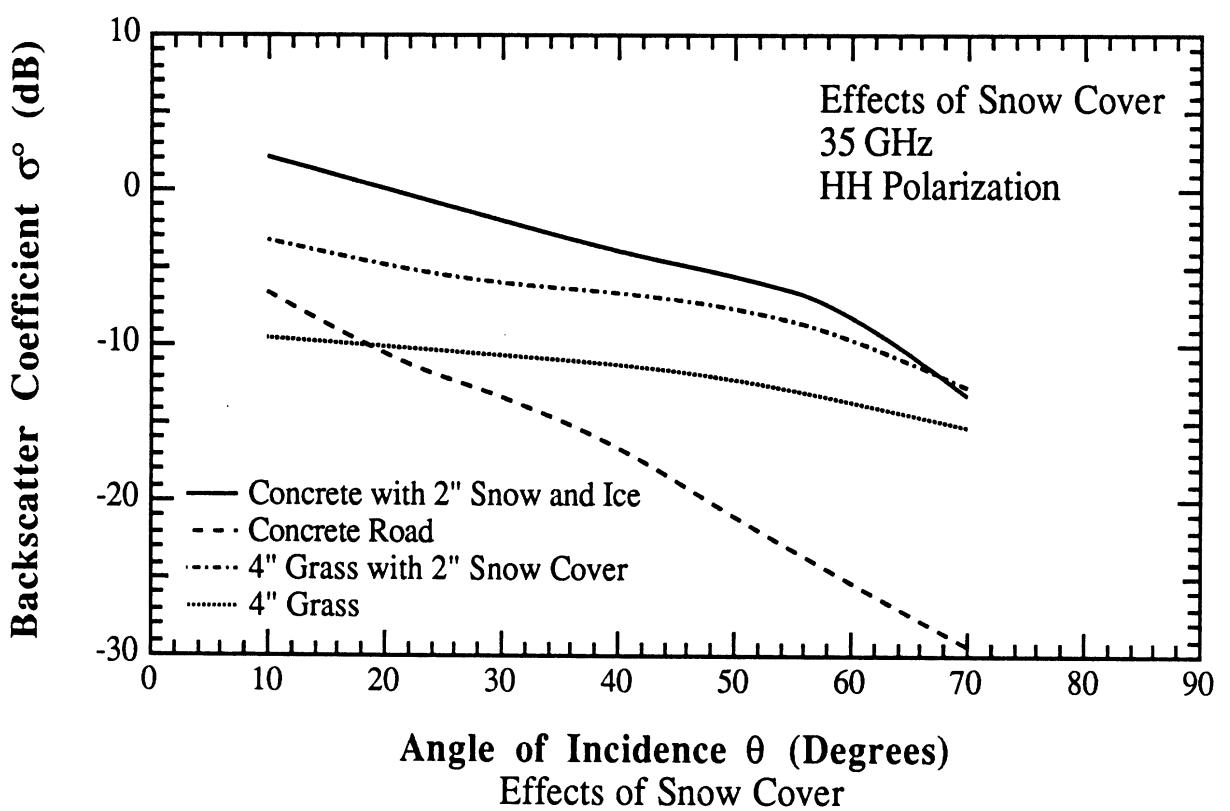

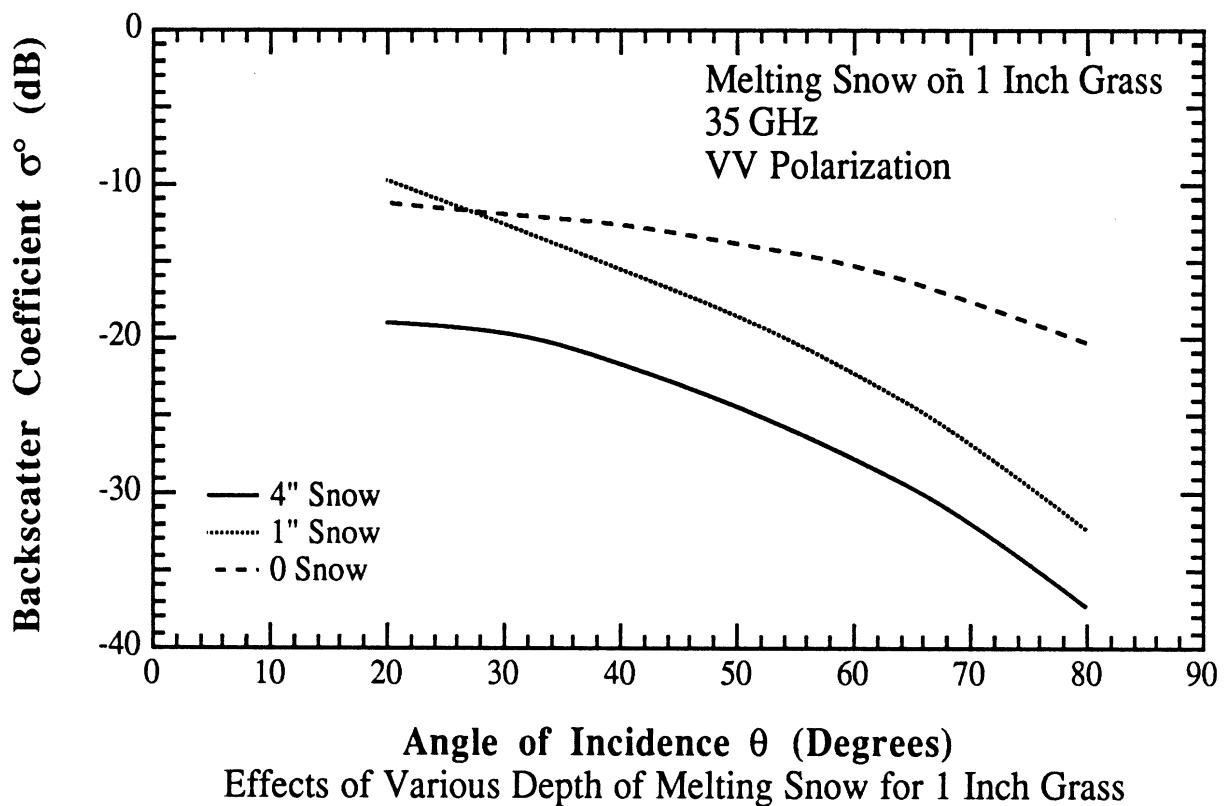

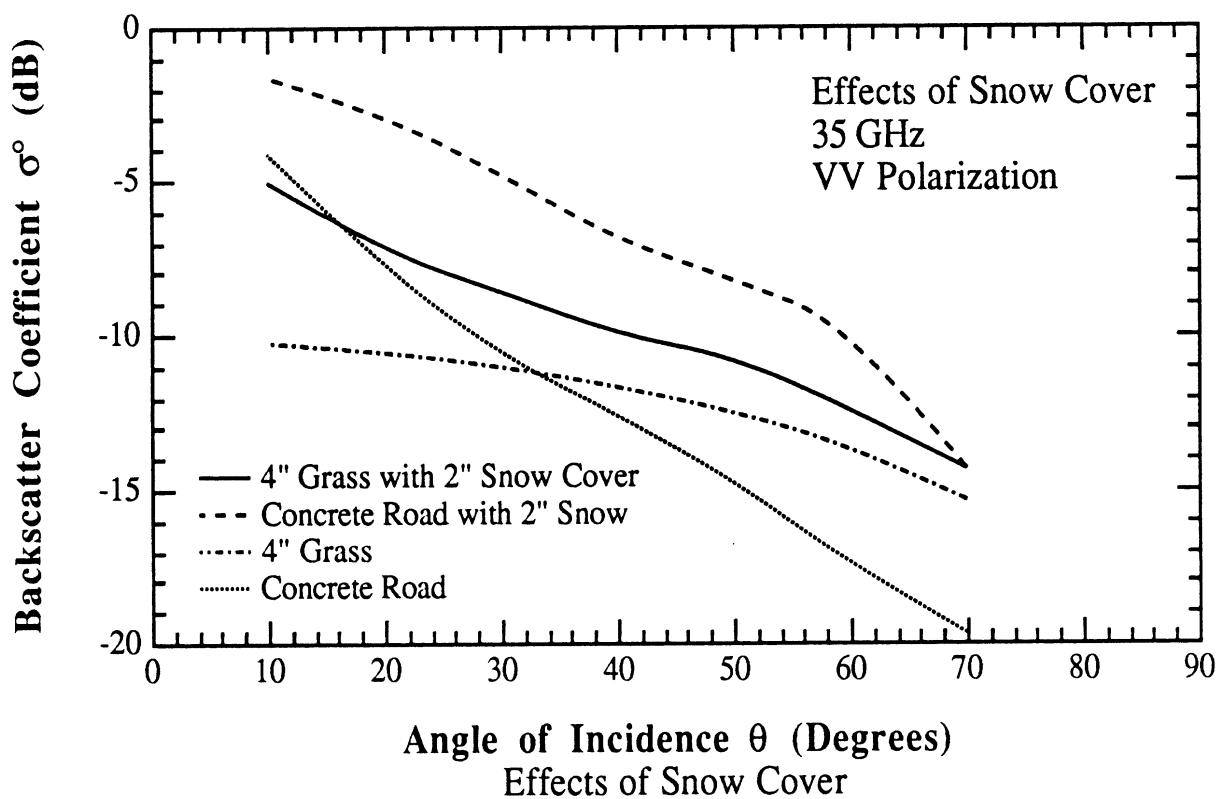

## B. Various Surfaces With Snow Cover

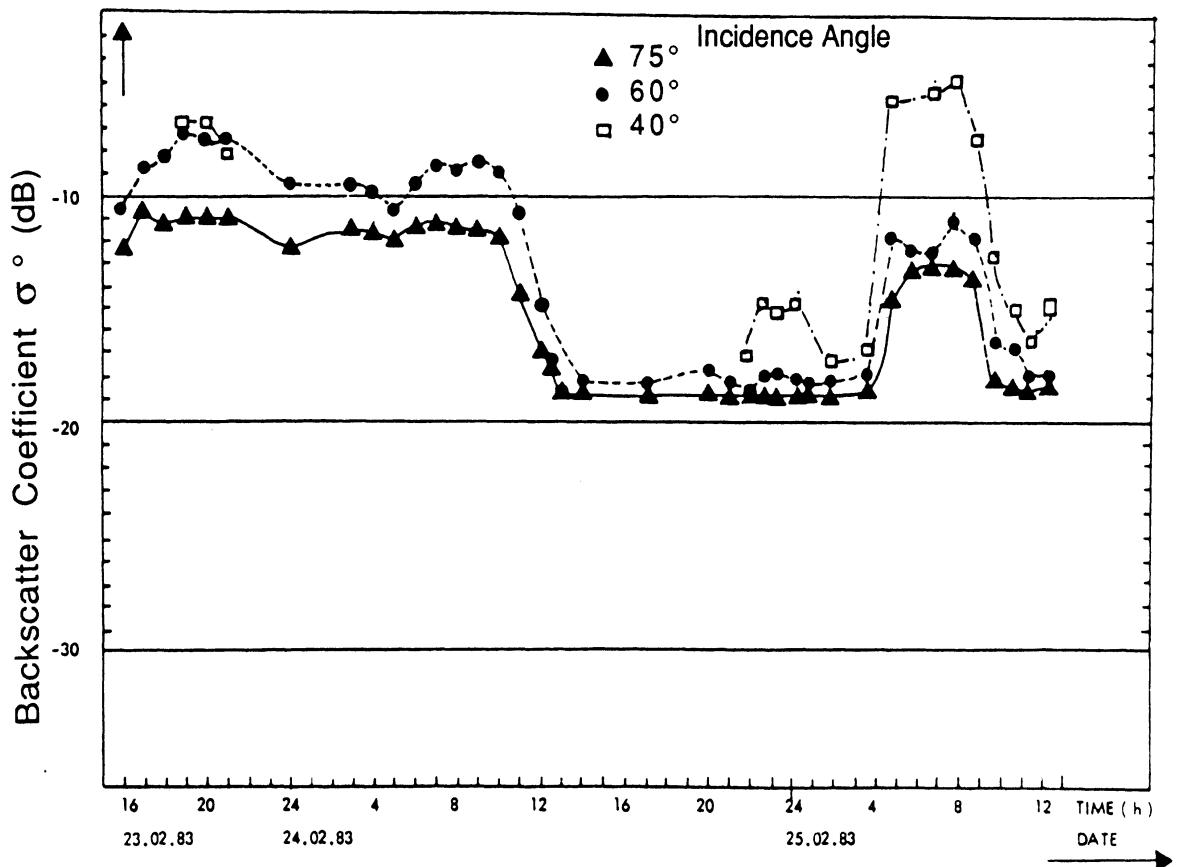

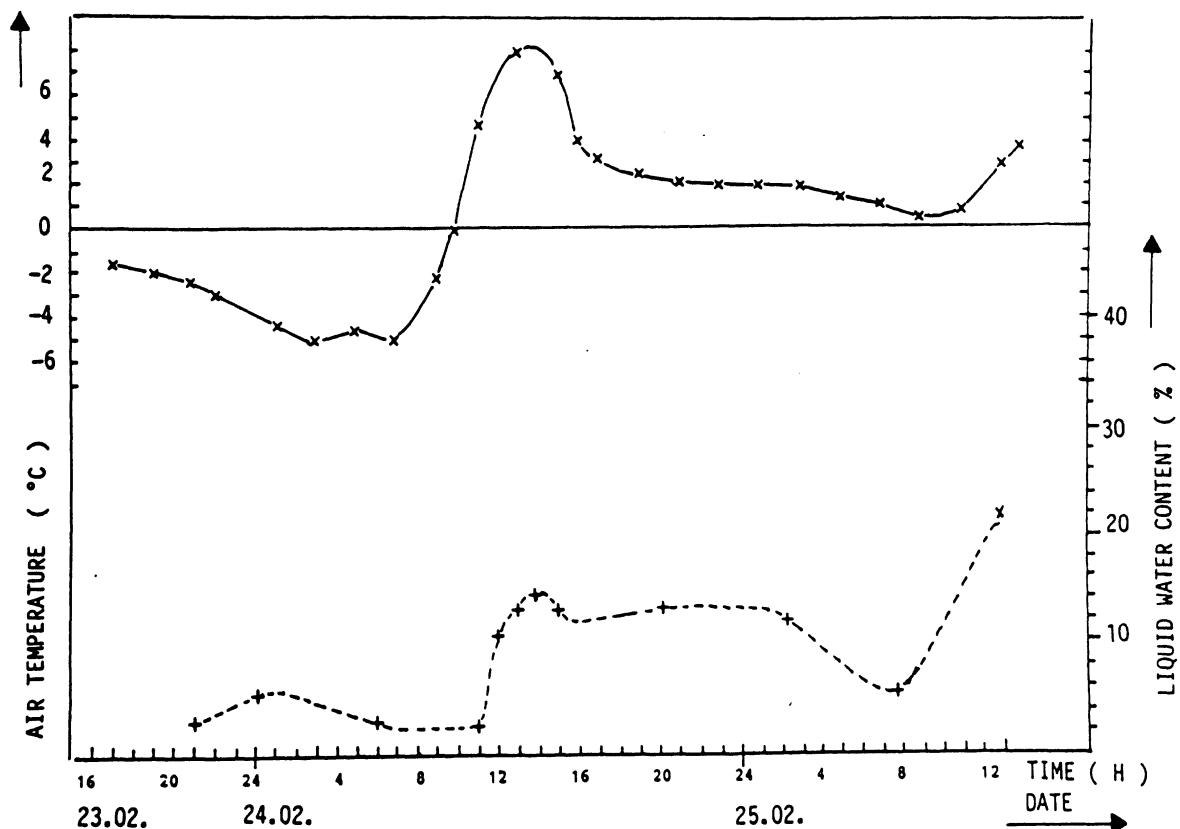

## **PART V. OTHER MMW DATA**

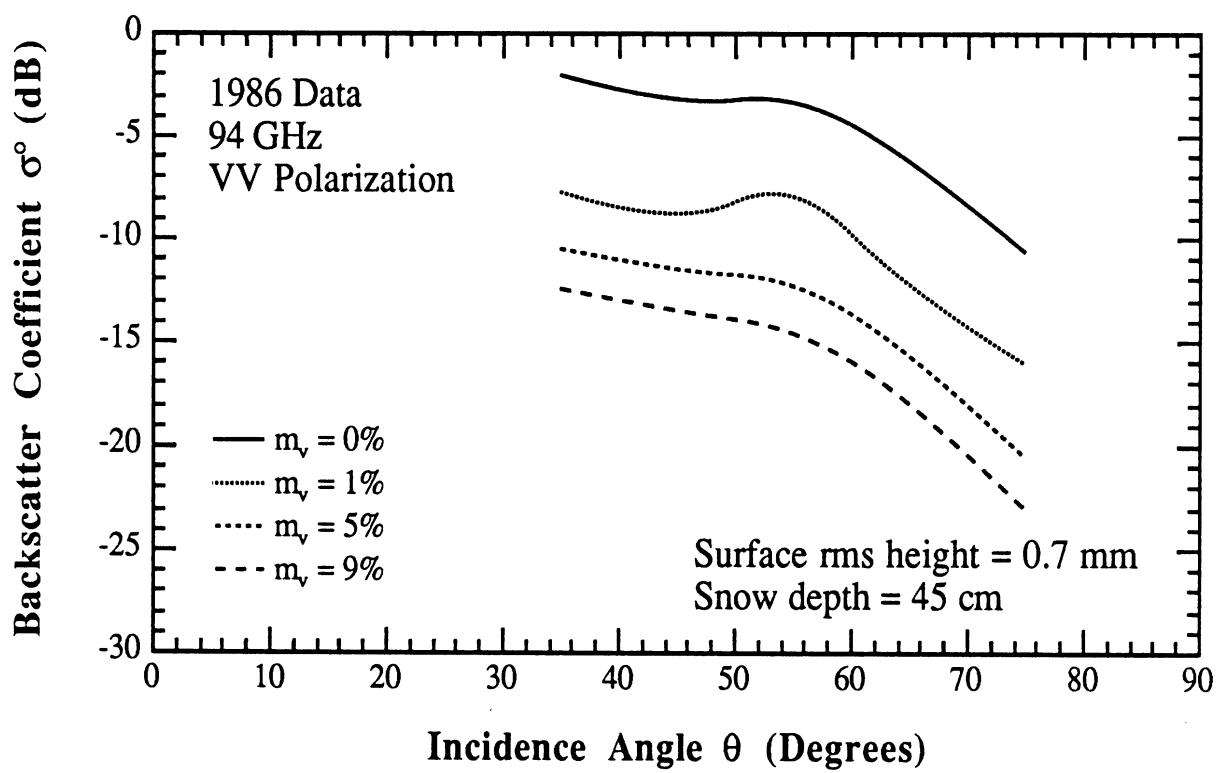

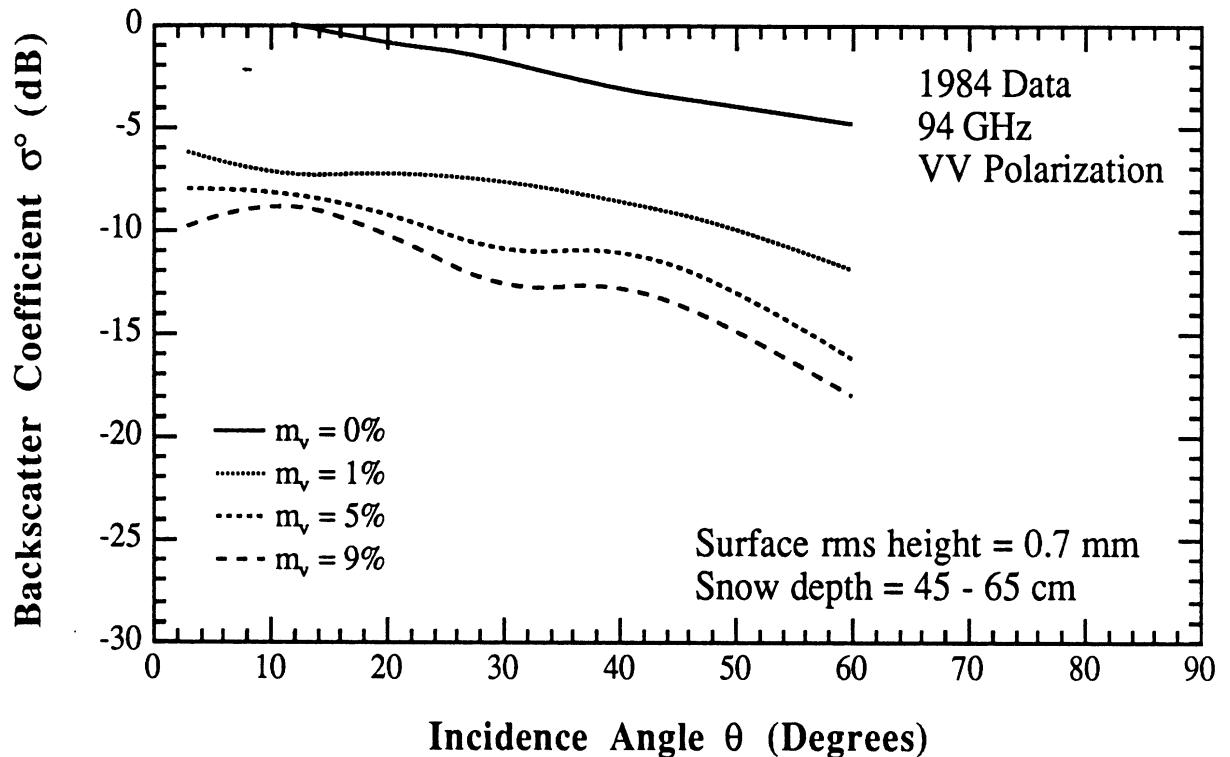

This part of the Handbook includes MMW data reported by organizations other than those covered in previous chapters of this Handbook. The data, the majority of which was extracted from plots published in scientific journals, do not include measurements that lack adequate ground-truth information or whose accuracy cannot be ascertained.

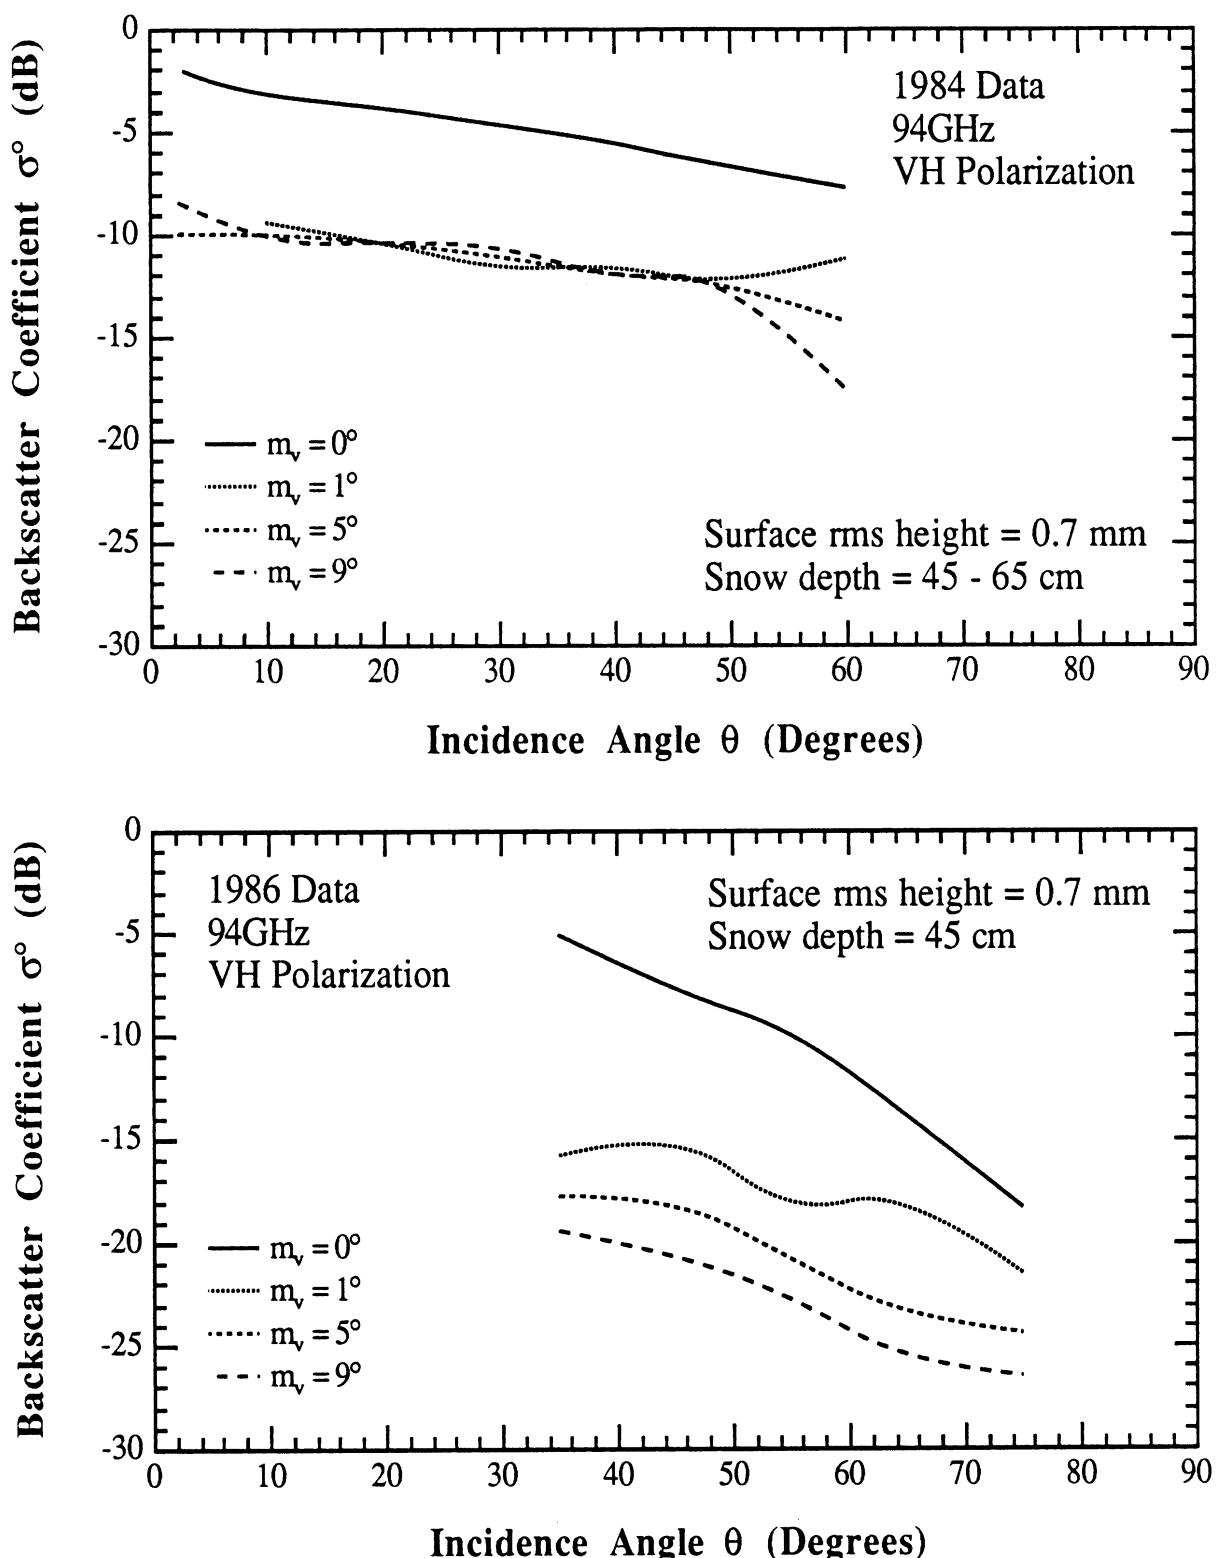

Diurnal variation of reflectivity for a metamorphic snow state at 94 GHz

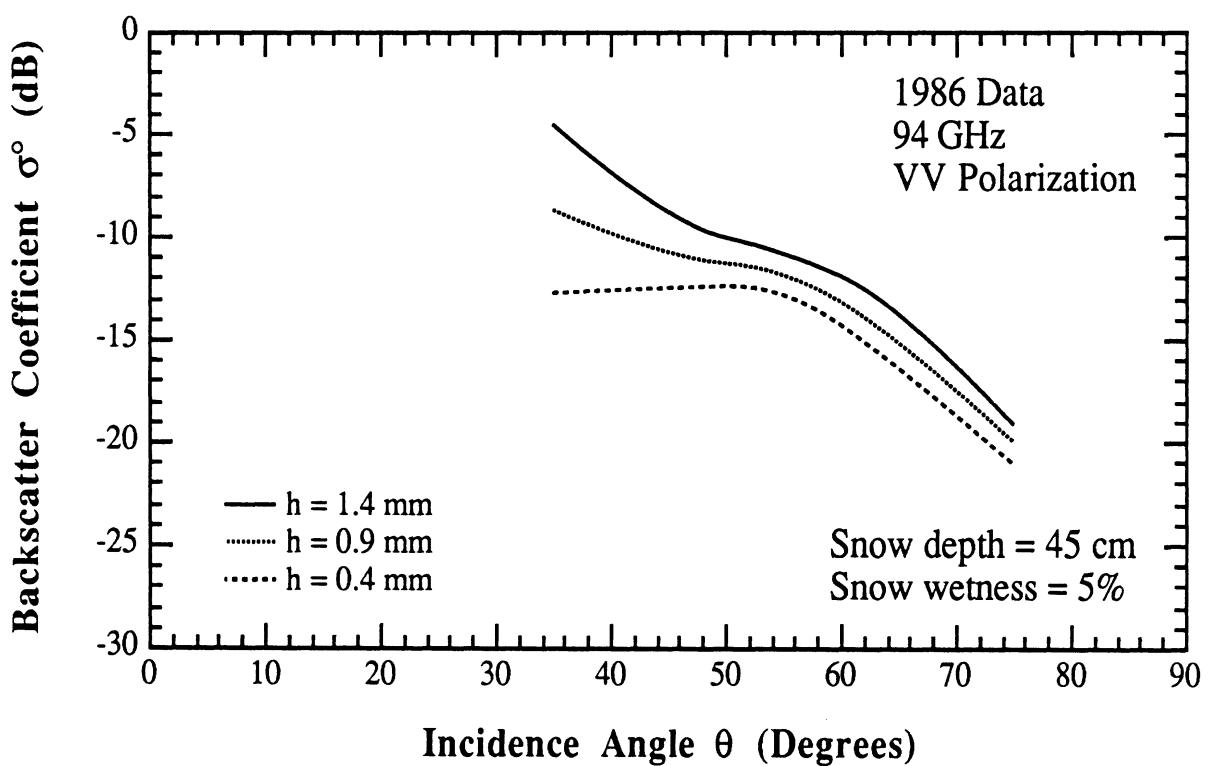

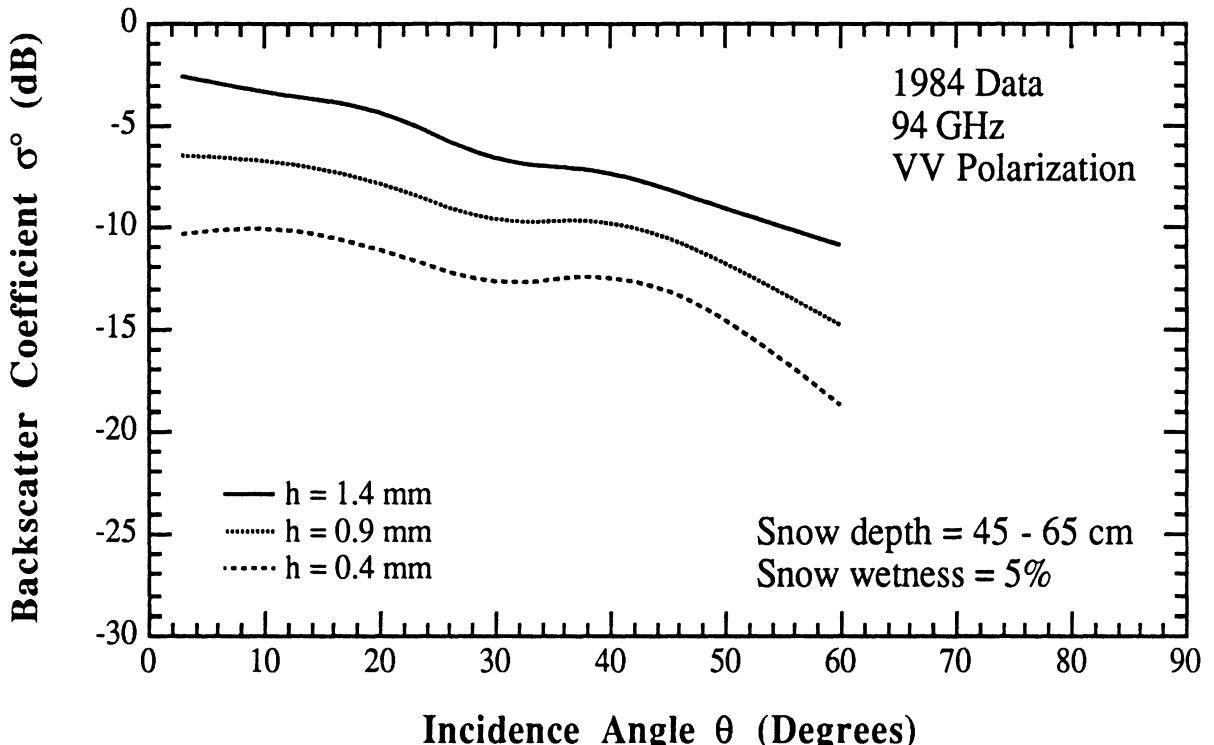

Diurnal variation of air temperature and liquid water content of snow from 23/2 to 25/2/82. From [23].

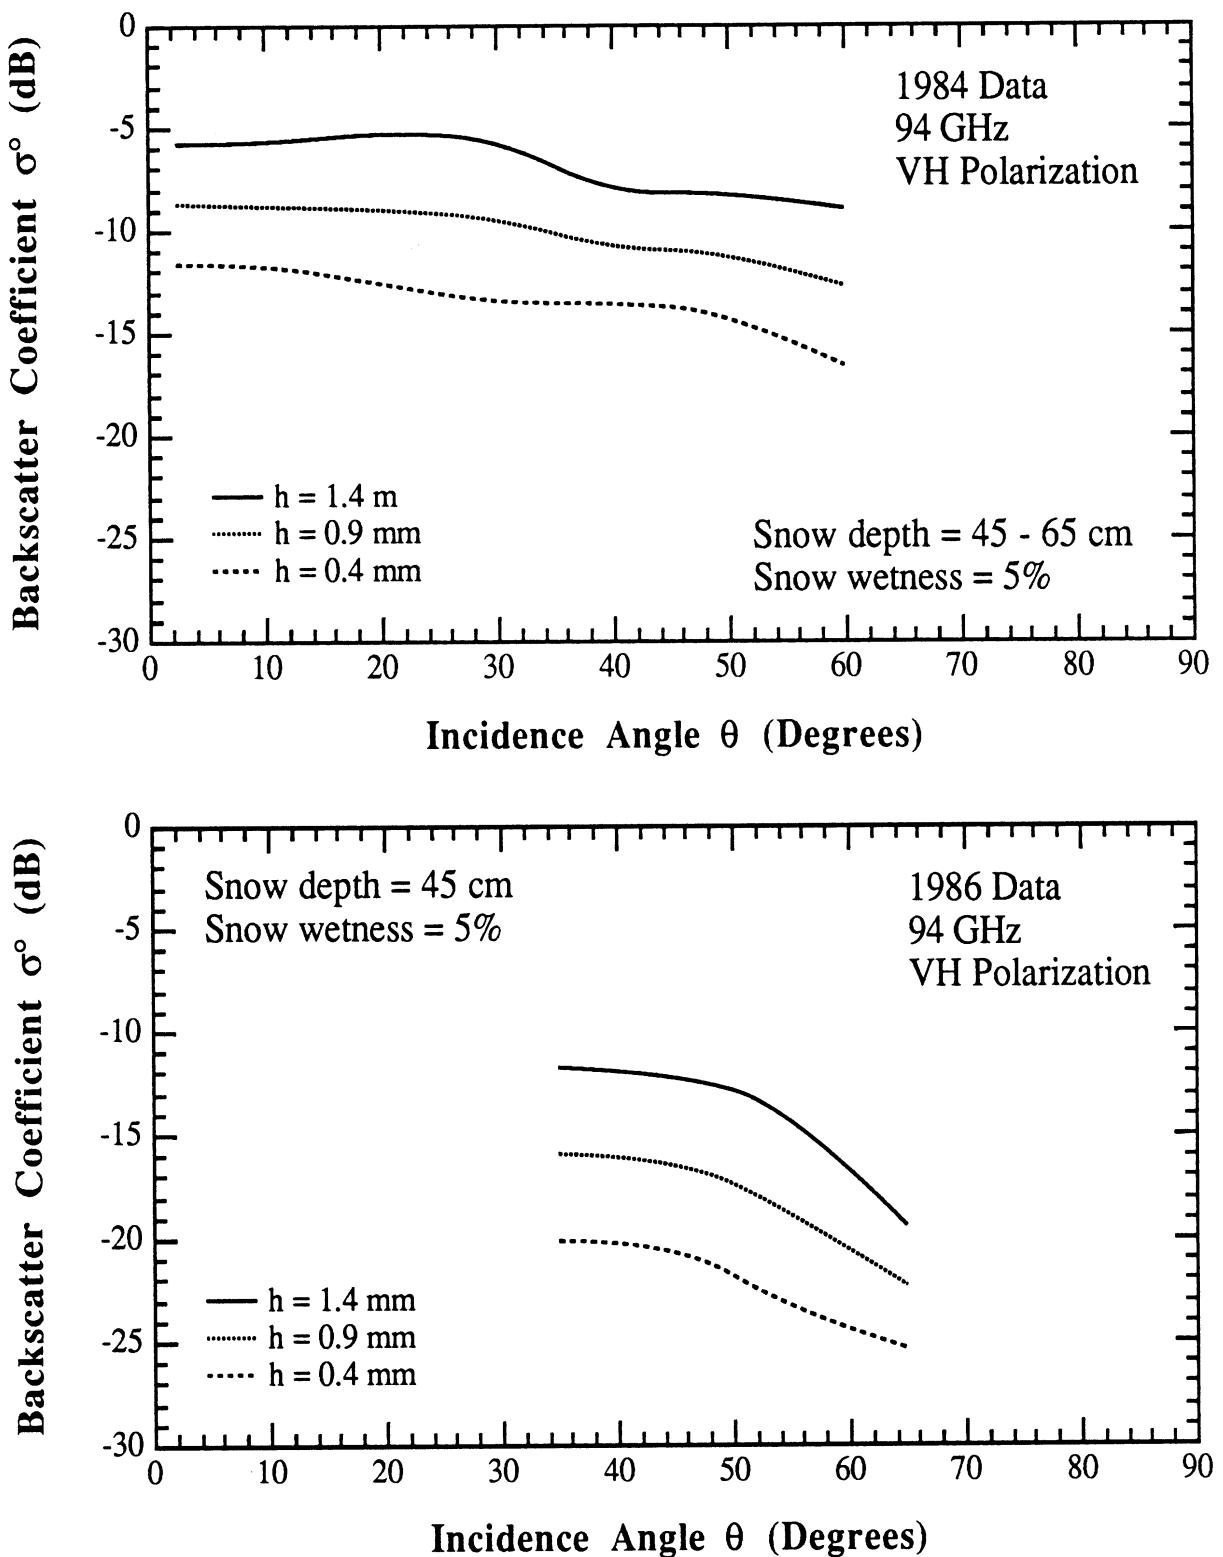

VV - Polarized Backscatter of Snow Measured in 1984 and 1986 for Various Liquid Water Contents  $m_v$ . From [24,25].

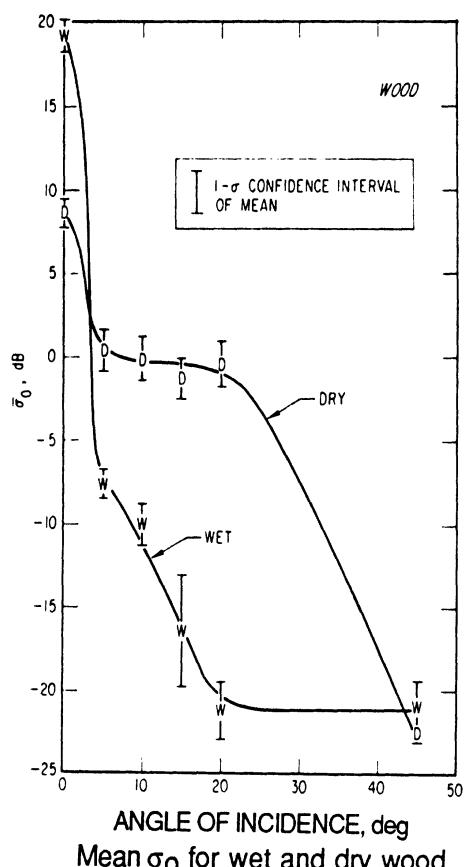

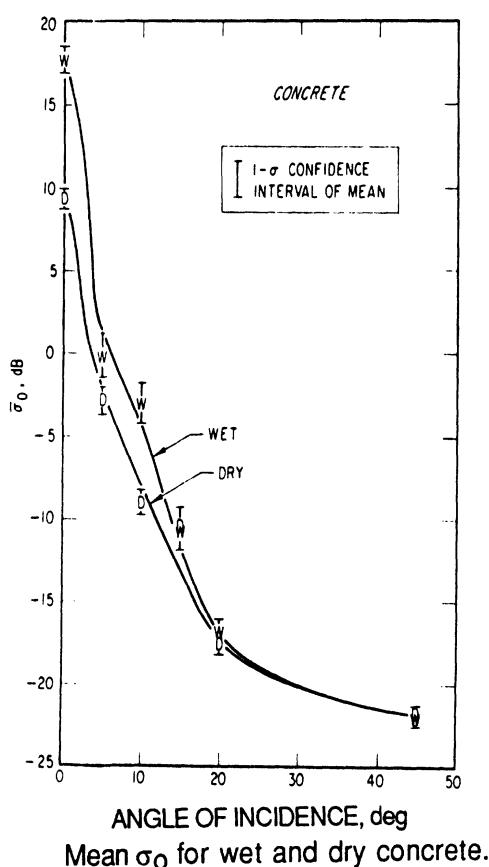

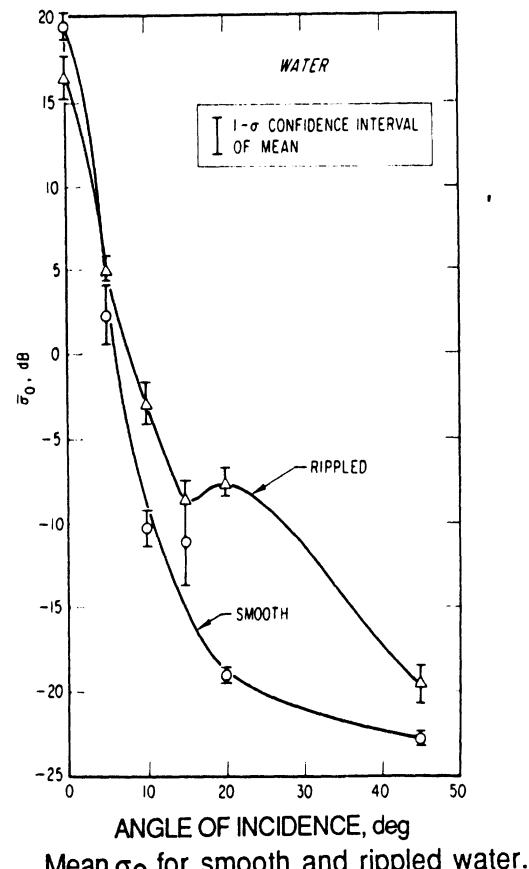

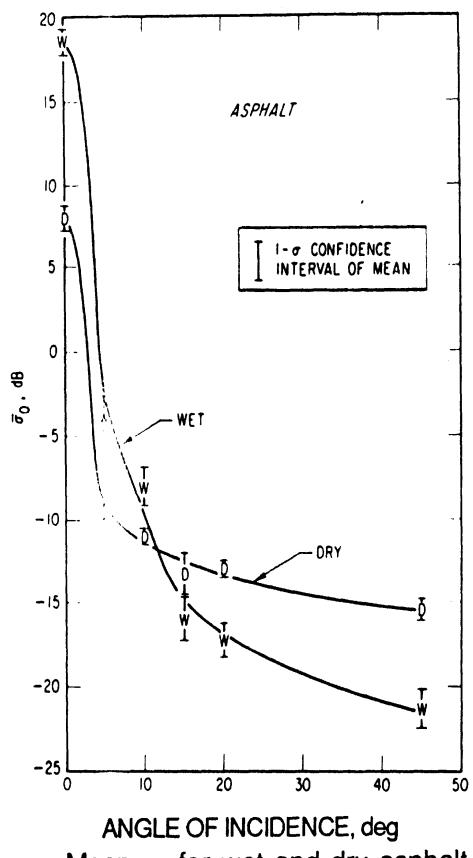

VH - Polarized Backscatter of Snow Measured in 1984 and 1986 for Various Liquid Water Contents  $m_v$ . From [24,25].

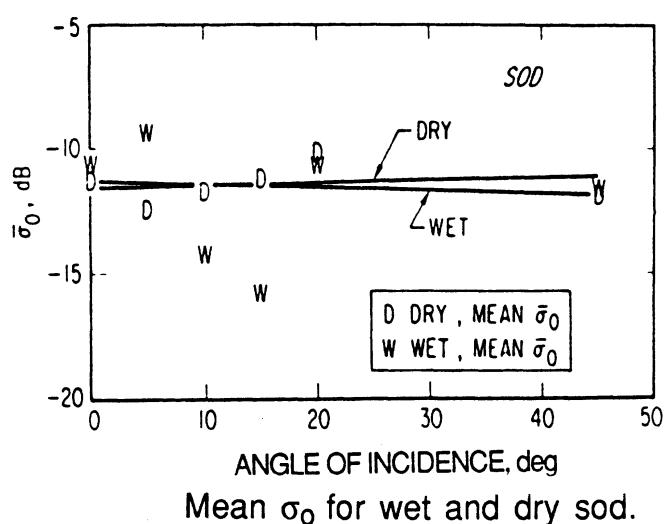

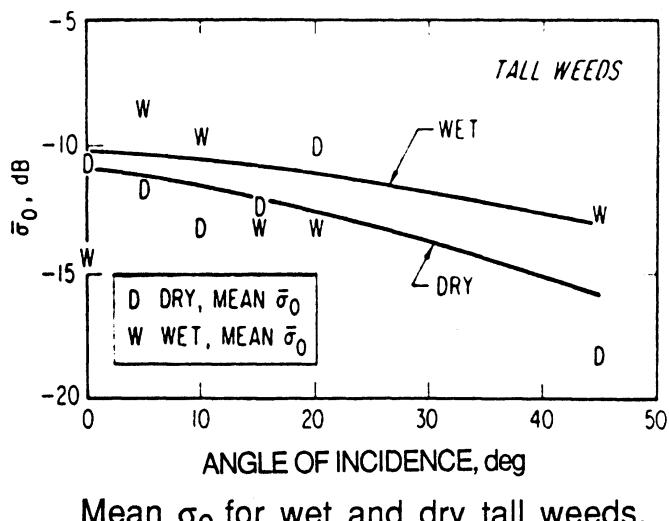

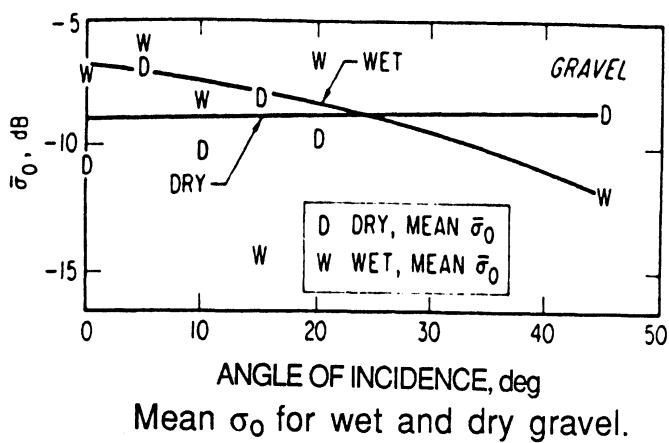

VV - Polarized Backscatter of Snow Measured in 1984 and 1986 Liquid Water Content of 5% and Various Surface Roughnesses ( $h$  = rms height). From [24,25].

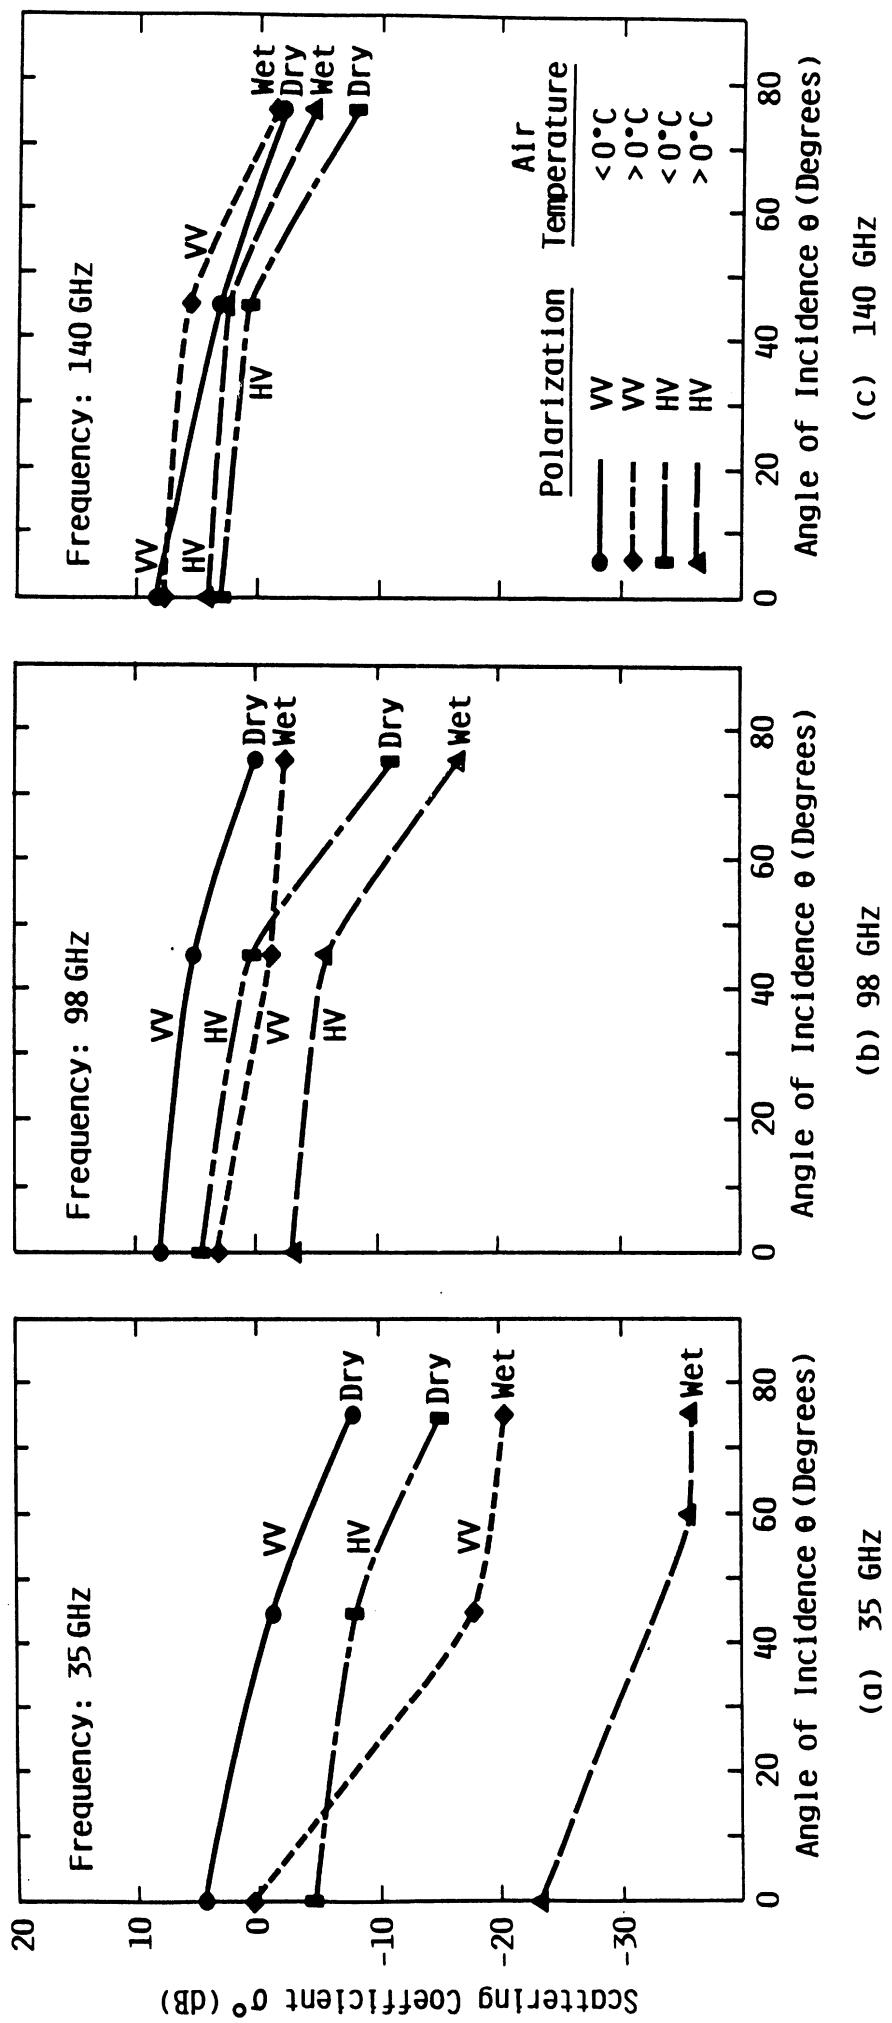

VH - Polarized Backscatter of Snow Measured in 1984 and 1986 Liquid Water Content of 5% and Various Surface Roughnesses ( $h$  = rms height). From [24,25].

Backscattering Coefficient, Averaged over 40-90 GHz for various surfaces. From [26].

Backscattering Coefficient, Averaged over 40-90 GHz for various surfaces. From [26].

Backscattering Coefficient at (a) 35 GHz, (b) 98 GHz, and (c) 140 GHz for Dry and Wet Snow. From [28].

| 19. ABSTRACT (Continue on reverse if necessary and identify by block number)<br><br>This report provides a summary of experimental observations of the radar backscatter from terrain, as reported in the literature. The data is at 35, 94, 140 and 225 GHz, primarily at HH, VV, and HV polarizations. The terrain types observed include dry and wet snow, ice-covered ground, trees, grasses, asphalt, gravel, and others. |  |   |                         |
