15. Supplementary Notes			
16. Abstract <p>This report supplements a report to the UMTRI report entitled "Validation Command Language (1979 Version)." The Validation Command Language computer program has been developed to aid the automotive safety researcher in quantifying comparisons between input test results and predictions of mathematical crash victim simulations. Applications are manipulation, analysis, comparison, and graphical display of dynamic impact data. Examples and user information is contained in the report.</p>

## 1.0 INTRODUCTION

This report supplements the UMTRI report entitled "Validation Command Language (1979 Version)" (See Reference 1), Section 2. Part 2 of the report amplifies Section 2.2.1 and 2.2.7 of Reference 1 to provide step-by-step instructions for filtering data. Part 3 deals with the changes to the original VCL (now known as the MVMA version). Parts 4 and 5 deal respectively with the CAL/HSRI 3-D Version of the VCL and the new graphics postprocessor for the VCL.

## 2.0 USER INSTRUCTIONS FOR FILTERING DATA

The sections of the VCL report which are pertinent to this discussion are found in Section 2.2.1 (pp. 15 and 16), Section 2.2.7 (pp. 29 to 34), and example three contained in Section 2.4 (pp 43 to 45 and 65 to 95).

The following steps can be used to achieve filtering of data by means of the VCL.

Step 1. The data to be filtered is formatted as follows: if 600 points are to be provided, 602 cards must be prepared. The first card contains the start time, the time increment ( $\Delta t$ ), the number of points (600), the dimension code, and a unit switch. See pp. 15 and 16 of report for details on the selection of these quantities.

The second card contains the format in parenthesis starting in the first column, e.g., (E15.0). Then follow the six hundred (or whatever) data cards, one point per card which may be left-adjusted if a decimal point is always punched. Otherwise the decimal point will be placed according to the specified format from the right of the field specified in the format.

Step 2. The Sampling rate  $s=1/t$  is computed and the frequency (f) at which filtering is desired is chosen. The ratio or normalized upper passband frequency is computed as  $f/s$ . Then using Table 6 of the report (page 34), the value in the second column closest to this ratio is selected and the corresponding filter name in the first column is jotted down, e.g., LP224492.

If none of these filters is acceptable, it is possible to generate a new filter made to order (with the FG command) or it is possible to halve or quarter the sampling rate and perhaps find a ready made filter closer to the desired normalized upper passband frequency. These two techniques are not normally used and will not be described here.

Step 3. The VCL is then run using the commands outlined in Table 1 with the data deck provided in Step 1 attached to the logical device number named.

TABLE 1. VCL COMMANDS FOR FILTERING USER DATA

CP.

1, final time (msec), output unit switch (see page 7)\*

TR filename\*

TQ TESTV.

1,  $\Delta t$  (msec), final time (msec)\*

FD TESTV, TESTQ, filtername.

TP TESTQ

0,  $\Delta t$ , final time\*

\*The values referred to symbolically are supplied to be consistant with those specified in the data deck generated in Step One which is stored in file "filename". The filtername used is the one determined in Step Two.

### 3.0 UPDATES TO THE MVMA VERSION OF THE VCL

The principal changes in the MVMA Version have to do with a restructuring of the data references to MVMA quantities stored from the MVMA runs. Command changes also have occurred in the McAuto implementation. The next subsection deals with these command changes. The final subsection deals with the corrections for data references.

#### 3.1 Changes in Commands

The McAuto version changes one command and implements the "OFF-LINE" option of the "Start Plot" command.

The Test Quantity Command no longer accepts a filename. A TQ is meaningful only after a TR and before the next TR or MR or FG. Likewise a MQ is meaningful only after a MR and before the next TR or MR or FG. Table 2 presents the revised commands.

#### 3.2 Changes in Data Reference Parameters

Many changes have been made in quantities printed as part of the MVMA 2-D tabular printout. Table 3 of this report replaces Table 3 of the VCL Report.

TABLE 2. REVISED MVMA VCL COMMANDS

Sentence Contents	Sentence Abbrevia- tion	Notes
<u>TEST RUN</u> Filename	TR	Filename of file which contains user data
TEST QUANTITY Dataname (a) File record number ( ) (b) Time increment (msec) (c) Final time (msec)	TQ	Dataname is name by which this data is to be referenced. File record number is starting record of file which contains first header card for this data. More than one such data set can exist in one file
<u>MODEL RUN</u> Filename 1 Filename 2	MR	Filename 1 is basic hold file for MVMA run and Filename 2 is contact information hold file

## 4.0 THE CAL/HSRI VERSION OF THE VCL

This original VCL was developed for use with the MVMA 2-D Model. It proved useful enough that a version was developed for use with the CAL/HSRI 3-D Model (Reference 2). This necessitated changes in the model data reading, many minor changes in commands, and a new model data reference system. The next subsection discusses the changes in commands while the last subsection discusses the available model data.

### 4.1 Changes in Commands

The data structure employed in CAL/HSRI 3-D Model storage is much simpler and less comprehensive than the MVMA 2-D. On the other hand, the CAL/HSRI 3-D Model has much more general possibilities in the use of units. The result of these differences caused changes in many commands. Table 4 contains the revised command prototypes. This table supplements both Table 2 of this report and Table 1 of the VCL Report. Table 5 of this report replaces Table 2 of the VCL report. The ordering restrictions mentioned in Section 3.1 also apply here.

### 4.2 Changes in Data Reference Parameters

The CAL/HSRI 3-D Model Data is specified by using the 3-D output page number, an index specifying which group of data on that page (there often may be more than one) and an index specifying which variable in the set. From these three indices, the model quantity desired is located in the binary hold file. Section 2.2.2 of the VCL Report does not apply to the CAL/HSRI 3-D Version of the VCL. Table 6 of the present report replaces both Tables 3 and 4 of the VCL report. The examples in the VCL report pages 43-95 do not apply to the CAL/HSRI 3-D VCL. Table 7 supplements Table 10 of the VCL Report while Table 8 supplements Table 17.

TABLE 4. CAL/HSRI VCL COMMANDS

Sentence Contents	Sentence Abbreviation	Notes
<u>CONTROL PARAMETERS</u> <u>Indimname</u> <u>forcedimname timename</u> (a) Print Control = no teletype output = 1 regular teletype output = 2 regular plus supplementary teletype output  (b) Default final time (timename)	CP	<p>The unit names supplies represent the basic units for VCL output in this run. If this command is completely left out the two values default to 0 and 300 and the units default to inches, pounds, and seconds</p>
<u>MODEL RUN Filename</u> (a) linear dimension factor (b) force dimension factor (c) time dimension factor	MR	<p>This filename of the CAL/HSRI 3-D Hold file. The three conversion factors are the necessary multiplicative constants to change the units of the CVS model output to the units desired for the VCL output</p>

TABLE 7. CAL/HISRI VCL DIAGNOSTICS

Diagnostic	Conditions	Routine Name
Page number entered is illegal	Must head to category between 1 and 15	MODAT
Set index entered is illegal	Must not be greater than maximum number of groups per page	MODAT
Variable index entered is illegal	Must be greater than number of variables per group	MODAT
Your VCL input unit does not agree with unit from CVS model run for index .. Please enter correct conversion factor for this unit on the next line	Input error, a conversion factor was necessary	MODRUN
VCL input unit for index .. has more than 4 letters. Please reenter CP card	Input error, only four characters allowed	COMPAR

Note: All diagnostics referring to routine names INST, MODAT, PICKUP, SEARCH have been removed.

TABLE 8. CAL/HSRI VCL SUBPROGRAM TABLE

Routine Name	Routines Called	Description
CONPAR	INTMAR, RINF, UNPACK	processes run controls
KATIN		finds proper category number given page number
MODAT	RINF, INTMAK, KATIN, IUN, STOREN	gets data quantity out of binary storage and stores it
MODRUN	RINF, INTMAR	sets up reading out of binary storage
TSTRUN	INTMAK, RINF,	prepares to read experimental data from file and calculates units conversion factors
UNPACK		separates letters of unit names for comparison and deletes any periods

## 5.0 THE VCL PLOTTING PROGRAM (PLOTVCL)

PLOTVCL is the plot generation postprocessor for the VCL package which uses the TEKTRONIX PLOT-10 system to produce high-quality graphics output on a graphic terminal.

### 5.1 PLOTVCL Functional Description

PLOTVCL is a stand-alone program which reads plot description information from a binary input file and produces plots on the VDU with a minimum of user interaction.

In the initialization stage, the user is prompted for his terminal type and date transmission rate. This is followed by a request for the name of the file in which the plot data are stored.

Plotting begins immediately after the filename is entered and continues until the plot file is exhausted. Each plot is terminated by the prompt "Press return to continue", drawn along the bottom edge of the screen. The plot displayed will remain on the screen until the return key is passed.

When the end of the plot file is reached, the user is informed of the END-OF-FILE and asked whether another file is to be plotted. A "Yes" response restarts the program, while any other response ends execution.

### 5.2 PLOTVCL Examples

Three examples are included to illustrate output from the PLOTVCL Program. A run of a data set known as Tutorial Example N.2(T2D) produced hold files which were run through the VCL to produce plots under both the PRINT and OFF-LINE options. In this manner parallel examples of plots of Head Angle Verus Time (Table 9 and Figure 1), Head Acceleration Versus Time (Table 10 and Figure 2), and Head Angle Versus Head Acceleration (Table 11 and Figure 3) were obtained.

### 5.3 Plot Data File

The plot data file is a binary file which contains all of the information needed to define the plots requested during the VCL session. It is composed of pairs of records. The first record of each pair has two items of information: an indicator of plot type and the number of

points in the data record which follows. The second record, the data record, contains the actual values of the points to be plotted, along with pointers to axis labels, page number, and time increment between points, if appropriate. Table 12 gives a detailed description of the possible record pairs.
