NOTICES

Sponsorship. The work reported herein is being published by the Institute of Science and Technology for the Advanced Research Projects Agency of the Office of the Secretary of Defense under Contract SD-78. Contracts and grants to the University of Michigan for the support of sponsored research by the Institute of Science and Technology are administered through the Office of the Vice-President for Research.

Acknowledgments. Messrs. Bongil Jeong and Roy E. Willie, Jr., graduate students in the Department of Geophysics, University of Utah, assisted in the compiling and execution phases of the computer programs. Financial support was provided from research contract No. AF 19(628)-201 with the Air Force Cambridge Research Laboratories of the U. S. Air Force under project VELA UNIFORM of the Advanced Research Projects Agency of the Department of Defense.

DDC Availability. Qualified requesters may obtain copies of this document from:

Defense Documentation Center
Cameron Station
Alexandria, Virginia

Final Disposition. After this document has served its purpose, it may be destroyed. Please do not return it to the Institute of Science and Technology.

PREFACE

VESIAC, the VELA Seismic Information Analysis Center, is an information collection, analysis, and dissemination facility established at the Institute of Science and Technology of The University of Michigan. The contract is sponsored by the Advanced Research Projects Agency under the Office of the Secretary of Defense.

The purpose of VESIAC is to analyze the research information related to the VELA UNIFORM Program of Project VELA and to function as a central facility for this information. The facility will serve all authorized recipients of VELA UNIFORM research information by issuing subject bibliographies with abstracts and special reports as required. In addition, VESIAC will periodically summarize the progress of the research being conducted.

VESIAC is under the technical direction of the Acoustics and Seismics Laboratory of the Institute. In its operation VESIAC draws upon members of this laboratory and other members of the Institute and University.

TABLES OF AMPLITUDE AND ENERGY RATIOS FOR PLANE SV WAVES

ABSTRACT

This report presents tabulations of energy ratios calculated from Knott's energy equation, and amplitude ratios calculated from the Zoeppritz equations, for a plane SV wave incident on a plane elastic discontinuity. All computations were programmed in FORTRAN for an IBM 1620 digital computer. Incident angles were varied from 0° to 90° in increments of 2° except near the critical angles, where the ratios were calculated in increments of 0.25° generally. Both real and imaginary coefficients were considered in the calculations. The varying parameters were the velocity ratio and density ratio across each interface, and the angle of incidence. Energy ratios were computed for a Poisson's ratio of 0.25 only, and amplitude ratios were computed for Poisson's ratios of both 0.25 and 0.40. Compressional velocity ratios (transmitted/incident) of 0.7, 0.8, and 0.9, and density ratios (transmitted/incident) of 0.7, 0.8, 0.9, and 1.0 were used. The data are presented in 36 tables, 12 for energy ratios and 24 for amplitude ratios.

1

INTRODUCTION

Energy ratios from Knott's energy equation and amplitude ratios from the Zoeppritz equations are presented in tabular form for a plane SV wave incident on a plane elastic discontinuity. All computations were programmed in FORTRAN for an IBM 1620 digital computer with a core storage of 60,000 bits. Both real and imaginary coefficients were considered in the calculations. The velocity ratio, the density ratio, and the angle of incidence were varied across each interface. Compressional velocity ratios (transmitted/incident) of 0.700, 0.800, and 0.900, and density ratios (transmitted/incident) of 0.700, 0.800, 0.900, and 1.000, are used.

With the exception of the amplitude-ratio data for Poisson's ratio equal to 0.400, all of the data presented herein in tabular form are shown as curves in a recent publication [1], for which Poisson's ratio was kept constant at 0.25.

2

GENERAL METHOD OF COMPUTATION AND ACCURACY OF DATA

The determination of the relative energies and amplitudes of waves derived from a plane SV wave incident on a plane interface involves the solution of four simultaneous linear equations [2, 3] with real and imaginary coefficients. The equations were solved in the real and complex domains by the Crout method [4], which was programmed in FORTRAN I and FORTRAN II. The

variable-field-length capability of the 1620 FORTRAN II system provided a means of checking the accuracy of the solutions, most of which were obtained by using a floating-point precision of eight decimal places. Those solutions which were obtained in FORTRAN II by using a floating-point precision of sixteen decimal places differed only in the seventh decimal place from those obtained by using a precision of eight decimal places. A conservation-of-energy check on all solutions was satisfied in every set of computations to at least the sixth decimal place in FORTRAN I, and to the fourteenth decimal place when the higher precision was used in FORTRAN II. The numerical results presented in the tables are accurate to the sixth decimal place.

3 ENERGY AND AMPLITUDE RATIOS

Amplitude ratios were determined from the Zoeppritz equations for a plane SV wave of amplitude B incident on a plane interface. These equations are [5, pp. 670-673]:

$$\begin{aligned}
 (B + D) \sin b + C \cos a - E \cos e - F \sin f &= 0 \\
 (B - D) \cos b + C \sin a + E \sin e - F \cos f &= 0 \\
 (B + D) \cos 2b - C(V/U) \sin 2a + EK(Z^2/VY) \sin 2e - FK(Z/V) \cos 2f &= 0 \\
 -(B - D) \sin 2b + C(U/V) \cos 2b + EK(Y/V) \cos 2f + FK(Z/V) \sin 2f &= 0
 \end{aligned} \tag{1}$$

where the angles and the velocities U, V, Y, and Z are as defined in Figure 1. The angle a is the angle of incidence of a compressional wave of velocity U which would generate four waves with the same reference angles as shown in Figure 1. K is the density contrast, equal to ρ_1/ρ_2 , where ρ_1 and ρ_2 are the densities of the upper and lower media, respectively.

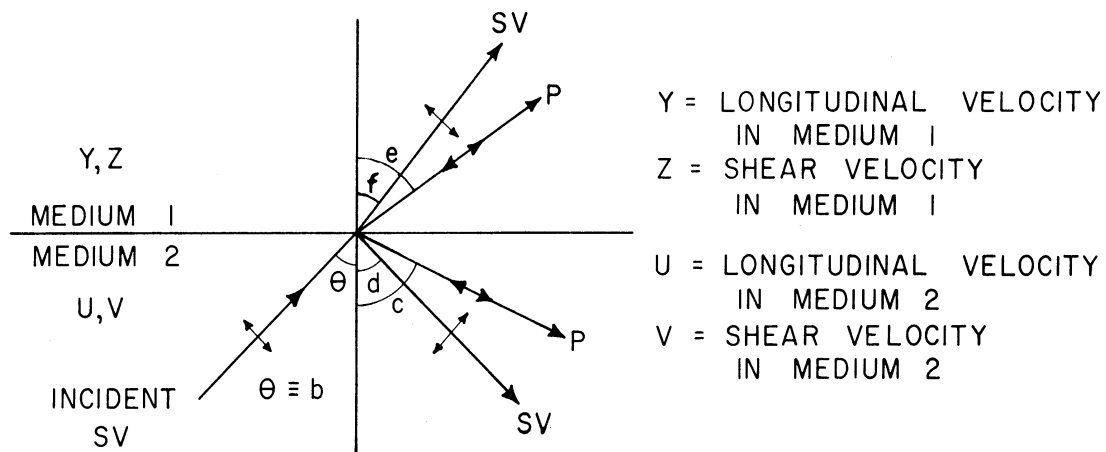

FIGURE 1

With B set equal to unity, the equations were solved for C, D, E, and F, which are the amplitudes of the reflected P, reflected S, transmitted P, and transmitted S waves, respectively. The quantities are complex after the first critical angle of 35.264° , for a Poisson's ratio of 0.250. For velocity ratios Y/U equal to 0.700, 0.800, and 0.900, second critical angles occur at 55.567, 46.194, and 39.904 degrees, respectively, for Poisson's ratio of 0.250.

Both the real and the imaginary parts of the complex amplitudes are printed out in the tables. The physically significant quantity is the modulus of the complex amplitude, which is the square root of the sum of the squares of the real and imaginary parts of the complex amplitudes.

The phase shifts associated with the complex domain can be determined from the entries in the tables. Beyond the first critical angle, the amplitudes of the derived waves are complex, and all derived wave amplitudes will generally undergo phase changes. The complex amplitudes computed from the Zoeppritz equations are printed out in the form $a + ib$. The phase angle ϕ of the derived wave is given by

$$\phi = \tan^{-1} \frac{b}{a}$$

The quantities a and b identify the quadrant and thus the phase angle of the derived wave.

The distribution of energy among the four waves derived from a plane incident SV wave can be obtained from Knott's energy equation for an incident SV wave [6, p. 173, Equation 7.80], which can be written in the form:

$$1 = \frac{(\cot c) C^2 U^2}{(\cot d) V^2} + D^2 + \frac{\rho_1 (\cot e) E^2 Y^2}{\rho_2 (\cot d) V^2} + \frac{\rho_1 (\cot f) F^2 Z^2}{\rho_2 (\cot d) V^2} \quad (2)$$

The terms on the right-hand side of this equation represent the energies of the reflected P, reflected S, transmitted P, and transmitted S waves, respectively, relative to the energy of an incident SV wave of amplitude B, with B set equal to unity. The energy ratios were obtained by determining the amplitudes C, D, E, and F from the Zoeppritz equations, inserting these values in Equation 2, and then evaluating each term in the equation. These individual ratios were then printed out as the energies of the reflected P, reflected S, transmitted P, and transmitted S waves, respectively, relative to the energy of an incident SV wave.

The computed energy ratios from Equation 2 serve as a useful check on the accuracy of the amplitudes determined from the Zoeppritz equations. The sum of the terms on the right-hand side of Equation 2 differs from unity only in the seventh decimal place at worst, when a floating-point precision of eight decimal places was used in the computations.

In applying the conservation-of-energy equation for angles greater than 35.264 degrees, for Poisson's ratio of 0.250, the terms on the right-hand side of Equation 2 are complex. The imaginary parts of all of these terms must add up to zero and the real parts to unity, in every set of computations. The sum of the moduli of the complex energies of those derived waves whose angles of reflection or refraction are not imaginary will be unity. The moduli of those waves whose angles of reflection or refraction are imaginary are not included in the summation.

4

FORMAT OF TABLES

The velocity ratio (transmitted/incident), Poisson's ratio for the incident medium, Poisson's ratio for the transmitted medium, and the density ratio (transmitted/incident) are listed above each set of computations for both energy ratios and amplitude ratios.

Energy ratios computed in the real domain are presented in the following format:

ANGLE	ERP	ERS	ETP	ETS	ENERGY
2.00	.00126547	.11566885	.00025266	.88281290	.99999988

where ANGLE refers to the angle of incidence, in degrees, of the plane SV ray, and ERP, ERS, ETP, and ETS are the energy ratios of the reflected P, reflected S, transmitted P, and transmitted S waves, respectively, to the energy of a plane SV wave. The ENERGY column is the conservation-of-energy check; for the energy computations, it is the sum of ERP, ERS, ETP, and ETS for a particular angle of incidence.

Energy ratios computed in the complex domain are presented in the following format:

ANGLE	ERP	ERS	ETP	ETS	ENERGY
37.00	.03779700	.04416885	.08750717	.83052694	.99999997
	.01022057J	.00826448J	.08019472J	-.09867977J	.00000000
	.03915448M	.04493539M	.11869582M	.83636875M	

For each angle of incidence, the imaginary part of the complex energy is followed by the letter J, and the real part is printed above this. The modulus is the square root of the sum of the squares of these first two entries, and is followed by the letter M. The first line in the ENERGY column for each angle of incidence is the algebraic sum of the real parts of the complex energies of the derived waves, and the second line in the ENERGY column is the algebraic sum of the imaginary parts of the complex energies of the derived waves. Theoretically, the former should be exactly unity, and the latter should be zero.

When the coefficient of a derived wave in the Zoeppritz equations becomes imaginary—that is, when the angle of reflection or refraction of that wave becomes imaginary—the computer is programmed to print the word IMAGINARY in the column corresponding to that particular derived wave just after the last set of computations for which the angle was real, that is, for which the derived wave existed physically. An example appears on the second page of the tabular material. In determining a conservation-of-energy check for those waves which do exist, only the moduli of coefficients not preceded anywhere in the column by the word IMAGINARY are used. Such calculations were not printed out explicitly, since the real and imaginary parts of the complex energies were always checked. The sum of the moduli of waves whose coefficients are not imaginary, however, should be unity.

Amplitude ratios computed in the real domain are presented in the following format:

ANGLE	RP	RS	TP	TS	ENERGY
26.00	.25561126	-.02091038	.23283892	1.29804660	.99999988

where ANGLE refers to the angle of incidence in degrees of the plane SV ray, and RP, RS, TP, and TS are the amplitudes of the reflected P, reflected S, transmitted P, and transmitted S waves, respectively, relative to the amplitude of an incident SV wave of unit amplitude. Sign changes in the real domain correspond to phase shifts of 180° with respect to the incident wave. The ENERGY column is the conservation-of-energy check, and is the algebraic sum of each of the terms in Equation 2.

Amplitude ratios computed in the complex domain are presented in the following format:

ANGLE	RP	RS	TP	TS	ENERGY
36.00	.29276898	.17911049	.27812276	1.27313730	1.00000000
	-.13548989J	.02127643J	.13531673J	-.06442387J	-.00000000
	.32260065M	.18036977M	.30929417M	1.27476620M	

For each angle of incidence, the imaginary part of the complex amplitude is followed by the letter J, and the real part is printed above this. The modulus is the square root of the sum of the squares of these first two entries, and is followed by the letter M. The first line in the ENERGY column for each angle of incidence is the algebraic sum of the real parts of each term in Equation 2; the second line is the algebraic sum of the imaginary parts of the terms. The word IMAGINARY is inserted by the computer, as described above, whenever a coefficient becomes imaginary.

Phase angles can be determined from the real and imaginary parts of the complex amplitudes $a + ib$ by the relation

$$\phi = \tan^{-1} \frac{b}{a}$$

A later modification of the FORTRAN program provided for the computation of these phase angles by use of the relation above. Amplitude ratios for a velocity ratio of 0.900, a density ratio of 0.800, and Poisson's ratio of 0.250 were computed by using this modified program. Phase angles are followed by the letters PA. In most computations, this angle must be added to or subtracted from 180° to identify the phase angle with the proper quadrant.

AD Div. 2/10
Inst. of Science and Technology, U. of Mich., Ann Arbor
TABLES OF AMPLITUDE AND ENERGY RATIOS FOR
PLANE SV WAVES, by John K. Costain, Kenneth L.
Cook, and S. T. Algermissen. VESIAC Special Report.
Dec. 63. 168 p. incl. illus., tables, 6 refs.
(Rept. No. 4410-68-X)
(Contract SD-78)

Unclassified report
This report presents tabulations of energy ratios calcu-
lated from Knott's energy equation, and amplitude ra-
tios calculated from the Zoeppritz equations, for a plane
SV wave incident on a plane elastic discontinuity. All
computations were programmed in FORTRAN for an
IBM 1620 digital computer. Incident angles were varied
from 0° to 90° in increments of 20 except near the crit-
ical angles, where the ratios were calculated in incre-
ments of 0.25° generally. Both real and imaginary co-
efficients were considered in the calculations. The

varying parameters were the velocity ratio and density ratio across each interface, and the angle of incidence. Energy ratios were computed for a Poisson's ratio of 0.25 only, and amplitude ratios were computed for Poisson's ratios of both 0.25 and 0.40. Compressional velocity ratios (transmitted/incident) of 0.7, 0.8, and 0.9, and density ratios (transmitted/incident) of 0.7, 0.8, 0.9, and 1.0 were used. The data are presented in 36 tables, 12 for energy ratios and 24 for amplitude ratios.

varying parameters were the velocity ratio and density ratio across each interface, and the angle of incidence. Energy ratios were computed for a Poisson's ratio of 0.25 only, and amplitude ratios were computed for Poisson's ratios of both 0.25 and 0.40. Compressional velocity ratios (transmitted/incident) of 0.7, 0.8, and 0.9, and density ratios (transmitted/incident) of 0.7, 0.8, 0.9, and 1.0 were used. The data are presented in 36 tables, 12 for energy ratios and 24 for amplitude ratios.

Inst. of Science and Technology, U. of Mich., Ann Arbor
TABLES OF AMPLITUDE AND ENERGY RATIOS FOR
PLANE SV WAVES, by John K. Costain, Kenneth L.
Cook, and S. T. Algermissen. VESIAC Special Report.
Dec. 63. 168 p. incl. illus., tables, 6 refs.
(Rept. No. 4410-68-X)
(Contract SD-78)

Unclassified report
This report presents tabulations of energy ratios calculated from Knott's energy equation, and amplitude ratios calculated from the Zoeppritz equations, for a plane SV wave incident on a plane elastic discontinuity. All computations were programmed in FORTRAN for an IBM 1620 digital computer. Incident angles were varied from 0° to 90° in increments of 20 except near the critical angles, where the ratios were calculated in increments of 0.250 generally. Both real and imaginary coefficients were considered in the calculations. The
