REVISION OF THRYALLIS (MALPIGHIACEAE)

Christiane Anderson
University of Michigan Herbarium
North University Building
Ann Arbor, Michigan 48109-1057

Thryallis comprises five species found in Brazil and adjacent Paraguay and Bolivia (Fig. 1). The genus is distinctive in its stellate pubescence covering nearly all parts, yellow flowers with eglandular sepals and petal limbs wider than long, and schizocarps of three nutlets subtended by a persistent spreading calyx. Thryallis is not similar to any other genus in the family, and its affinities are unknown; it is included in a current study by W. R. Anderson and M. C. Chase, who are investigating the phylogeny of the Malpighiaceae by comparing evidence from chloroplast DNA and morphology.

Although the genus differs greatly from other members of the Malpighiaceae, the species are morphologically similar and are best separated by characters of the abaxial leaf vesture and of the glands found at the base of the lamina and/or apex of the petiole (Fig. 2). The flowers are relatively uniform; only T. parviflora differs notably in its small petals and short styles. They are arranged opposite to subopposite on axes that are grouped into dichasia, compound dichasia, or small thyrses. Each short peduncle is subtended by a bract and bears a much longer pedicel, which is subtended by two bracteoles. The eglandular sepals are reflexed to revolute during anthesis, but as the fruit matures they elongate and become stiff and spreading. The three nutlets are then subtended by the rotate persistent calyx, which may aid in dispersal. The claw of the petal is ribbonlike, ca 1–1.5 mm wide, and expands into an oblate/reniform limb. The stamens differ only in that the anthers of those opposing the petals are slightly shorter than those opposing the sepals. The 3-carpellate ovary bears three slender styles; the capitate stigma is slightly reflexed and also slightly decurrent adaxially. Each rugose nutlet has the developing seed embedded in spongy tissue, presumably perisperm, that fills the locule; an unusual condition in the family. At maturity, the seed entirely replaces the spongy tissue.

The laminas are adaxially stellate-pubescent only when very young and soon become glabrous, whereas they are always abundantly pubescent abaxially. The unicellular hairs vary from sub sessile to stalked. The stalk is up to 0.4 mm long, and from its apex radiate 5–13 (15) branches up to 0.3 mm long. The abaxial lamina may also bear sessile hairs, the body ca 0.5 (0.7) mm in diameter with 8–19 short branches up to 0.2 (0.3) mm long. It is the mixture of sessile hairs and hairs with stalks of variable length that give the abaxial vesture its distinctive aspect. In T. brachystachys the sessile and short-stalked hairs (mostly only up to 0.01 mm long) are so densely packed that the vesture has a felty aspect and obscures the secondary and tertiary veins. In contrast, the pubescence of T. latifolia and T. parviflora is much looser; the stalks of the hairs vary from 0.03 to 0.4 mm long and are individually discernible. In all three species a basal cover of sessile hairs aids in hiding the epidermis. Such sessile hairs are absent in T. longifolia, in which the vesture is a mixture of long-stalked hairs (up to 0.3 mm long).
with the branches radiating only from the apex and shorter, somewhat stouter hairs in which branches radiate from the body of the stalk as well. The epidermis is always visible, owing to the loose arrangement of the hairs and the absence of sessile hairs. In *T. laburnum* the sessile hairs are lost as the leaf matures, and the epidermis is generally visible among the stalked hairs in older leaves. Yet, in a few instances (e.g., the NY duplicate of Moore 970) the larger leaves of the flowering branches that constitute the specimens still have the sessile hairs and, since the stalked hairs are only up to 0.1 mm long, thus are reminiscent of the leaves of *T. brachystachys*.

A pair of glands occurs at the base of the lamina or at the apex of the petiole, or the glands are borne along the margin a short distance from the base. Occasionally the glands are branched, and there may also be a second smaller pair. The glands are generally nearly circular and prominent (mostly to 0.5 mm but sometimes to 1 mm long). In *T. longifolia* and *T. parviflora* the glands are commonly elongated and knob- or peglike, up to 5.5 mm long; these, too, may be branched (Fig. 2c, d, m).
FIG. 2. Thryallis. a-i. *T. longifolia*. a. Flowering branch (×0.5). b. Apex of young inflorescence branch showing bracts and bracteoles (×4). c. Base of lamina, abaxial view, and petiole attachment, showing glands and epipetiolar stipules (×2.5). d. Fruit with persistent calyx (×1.5). i. Embryo (×5). j. *T. brachystachys*, base of lamina, abaxial view showing glands (×2.5). k. *T. laburnum*, base of lamina, abaxial view showing glands (×2.5). l. *T. latifolia*, base of lamina, abaxial view showing glands (×2.5). m, n. *T. parviflora*. m. Base of lamina, abaxial view showing branched peglike glands (×2.5). n. Lateral petal (×2.5). (Based on: a-c, Harley 16195; d, Harley 16429; e-g, i, Anderson 11379; h, Lützelburg 25770; j, Sucre 1442; k, Fröes 11690; l, Heringer 3815; m, n, Irwin 11341.)
The confusion surrounding the generic name *Thryallis* was discussed by Morton and Cuatrecasas (1967), who proposed conservation of the name *Thryallis* Mart. Linnaeus (1762) first published the name *Thryallis* with the species *T. brasiliensis*. Lindley (1828) published his *T. brachystachys* from Rio de Janeiro and Martius (1829) his *T. longifolia* and *T. latifolia* from Bahia; Martius also included a generic description. Jussieu (1832), the first monographer of the Malpighiaceae, noted that Lindley’s and Martius’s species were not congeneric with that of Linnaeus. He assigned *T. brasiliensis* L. to the genus *Galphimia* Cav., as *G. brasiliensis* (L.) Adr. Juss. (1832), and recognized *Thryallis* sensu Mart., in which he included *T. longifolia*, *T. latifolia*, and *T. brachystachys* (1840). Kuntze (1891) retained *Thryallis* L. and proposed *Hemsleyana* to replace *Thryallis* sensu Mart. In this he was followed most notably by Small (1910), who included species of *Galphimia* in *Thryallis* L. Niedenzu (1914, 1928), the second monographer of the family, rejected Kuntze’s *Hemsleyana* and followed Jussieu in accepting *Thryallis* Mart. The proposal by Morton and Cuatrecasas (1967) for conservation of *Thryallis* Mart. was accepted by the Nomenclature Section of the 11th International Botanical Congress in 1969, and *Thryallis* Mart. thus is included in the list of conserved names of the *International Code of Botanical Nomenclature* (Greuter et al. 1988). Regrettably, in some herbaria species of *Galphimia* are still routinely filed under *Thryallis*, perhaps in the mistaken belief that because *Thryallis* is a conserved name it displaces *Galphimia*. The correct disposition of names published in *Thryallis* that apply to species of *Galphimia* is beyond the scope of this revision; the reader is referred to Niedenzu’s list of names excluded from *Thryallis* Mart. (1928, p. 577).

**Hemsleyana** Kuntze, Rev. gen. pl. 1: 88. 1891.—Lectotype, here designated: *Hemsleyana longifolia* (Martius) Kuntze [= *Thryallis longifolia* Martius].

Scandent shrubs to woody vines. Stems and branches densely stellate-pubescent, the larger vegetative axes becoming glabrate to glabrous in age. Laminas elliptical to lanceolate or broadly so to sometimes suborbicular, apex acuminate to apiculate or apiculate-emarginate or obtuse-apiculate, base truncate or slightly cordate, adaxially stellate-pubescent when very young but soon glabrous, abaxially abundantly stellate-pubescent, with 1–2 pairs of glands at the apex of the petiole and/or the base of the lamina; petioles densely stellate-pubescent; stipules narrowly triangular, epipetiolar. Flowers borne opposite to subopposite on axes grouped in dichasia or compound dichasia or small thyrses, sometimes with 4 axes at a node; each peduncle subtended by a bract, each pedicel subtended by 2 bracteoles, pedicels always longer than the peduncles, bracts and bracteoles deciduous during anthesis or some retained through the fruiting stage or all caducous; axes, peduncles, pedicels, bracts, and bracteoles densely stellate-pubescent. Sepals 5, imbricate, elliptical to broadly so to broadly ovate, eglandular, densely stellate-pubescent adaxially and abaxially but with a glabrous patch at the base adaxially, reflexed to revolute during anthesis, elongating and becoming stiff and spreading in fruit. Petals 5, bright lemon-yellow, glabrous, the claw ribbonlike, ca. 1–1.5 mm wide, the limb wider than long, oblate/reiniform, margin irregularly dentate to erose or nearly lacerate, the lateral petals subequal or the anterior-lateral petals slightly larger than the posterior-lateral petals, the posterior petal with a thicker claw and
a little smaller than the lateral petals. Stamens 10, all fertile, glabrous, anthers abaxially with a gland on the connective, those of stamens opposing the petals slightly shorter than of those opposing the sepals. Gynoeicum 3-carpellate (sometimes 2-carpellate); styles 3 (sometimes only 2), slender, glabrous, erect, stigma capitate but somewhat reflexed and briefly decurrent adaxially, posterior styles slightly shorter than the anterior one; ovary densely stellate-pubescent. Fruit a schizocarp of (2–) 3 tardily separating nutlets subtended by the persistent calyx; nutlets rugose, with a prominent dorsal ridge or a small winglet; developing seed embedded in spongy tissue (perisperm?) filling the locule, mature seed filling the locule and then spongy tissue absent; seed and embryo ovoid, the large outer cotyledon distally folded over the smaller inner cotyledon.

**KEY TO THE SPECIES OF THRALLIS**

1. Abaxial vesture of all or at least the mature, larger leaves composed only of stalked hairs, sessile hairs absent and thus the epidermis readily visible.

2. Limb of lateral petals 7–10 mm long, 11–14 mm wide; laminas with a pair of prominently raised to peglike glands at the apex of the petiole, each gland 0.5–3.5 mm long, 0.5–0.7 mm in diameter, sometimes branched, often also with a second prominent pair at the base of the lamina or along the margin near the base; abaxial vesture of leaves of hairs with the stalk 0.1–0.3 mm long, in longer hairs the branches radiating from the apex only, the shorter hairs commonly with a stouter stalk and the branches radiating from along the stalk as well, sessile hairs always absent; eastern Brazil (Ceará to Bahia, and eastern Minas Gerais). *T. longifolia*.

2. Limb of lateral petals 6.5–8 mm long, (9–) 10–12 mm wide; laminas with a pair of prominently raised (never knob- or peglike) glands at the apex of the petiole, each gland 0.2–0.5 mm long, 0.7–1.2 mm in diameter; abaxial vesture of leaves of hairs with the stalks 0.01–0.1 mm long, the branches all radiating from the apex, in young leaves and in the reduced ones associated with the inflorescence sessile hairs present and thus obscuring the epidermis; southwestern Brazil (Mato Grosso do Sul) and adjacent Bolivia and Paraguay. *T. laburnum*.

1. Abaxial vesture of all leaves composed of short- to long-stalked hairs and sessile hairs, the epidermis not readily visible.

3. Laminas not rugose, adaxially the costa impressed but the secondary veins only slightly so or not at all, abaxially the costa prominently raised, the secondary veins promonilous, and the tertiary veins indistinct and mostly hidden by the dense indumentum; abaxial vesture of laminas composed of a mixture of stalked hairs and sessile hairs, the stalks to 0.1 (–0.2) mm long, the vesture very dense and forming an even covering, the stalks of individual hairs barely discernible (vesture sometimes looser in specimens from Santa Catarina); Brazil (eastern Minas Gerais, Espirito Santo to Santa Catarina) and eastern Paraguay. *T. brachystachys*.

3. Laminas rugose, the costa and all veins impressed adaxially, abaxially the costa, secondary, and tertiary veins prominently raised and the areoles sharply distinct; abaxial vesture of laminas composed of a mixture of short- to long-stalked hairs and sessile hairs, the stalks to 0.4 mm long, the vesture with a loose aspect, the stalks of individual hairs discernible.

4. Limb of lateral petals 4.5–5.5 (–6) mm long, 6–8 mm wide; laminas with a pair of glands at the apex of the petiole or at the base of the lamina at insertion of petiole, each gland knoblike to commonly peglike, 1.4–5.5 mm long, 0.5–1.4 mm in diameter, sometimes branched and the two pairs unequal in size; stalked hairs of abaxial laminar pubescence with 5–8 radiating branches; bracts and bracteoles deciduous or persistent during anthesis and sometimes retained in fruit; Brazil (Distrito Federal and Goiás). *T. parvisflora*.

4. Limb of lateral petals 10–11 mm long, 13–14 mm wide; laminas with a prominently raised pair of glands (sometimes branched, rarely peglike) at the apex of the petiole, each gland 0.3–1 (–2) mm long, 0.7–1.2 mm in diameter, sometimes also with a second prominent pair at base of the lamina or along the margin near the base; stalked hairs of abaxial laminar pubescence with 6–13 radiating branches; bracts and bracteoles caducous or deciduous during anthesis, not retained in fruit; Brazil (Minas Gerais and adjacent São Paulo). *T. latifolia*. 
**Thryallis brachystachys** Lindley, Bot. Reg. 14: 1162. 1828. *Hemsleya brachystachys* (Lindley) Kunth, Rev. gen. pl. 1: 88. 1891.—**Type:** [BRAZIL.] Specimen prepared from plants grown at the garden at Chiswick from seed sent by Forbes from Rio de Janeiro to the Horticultural Society of London (holotype: CGE, photo: MICH!).

*Banisteria mutabilis* Vellozo, Fl. flum. 193. Icones 4: t. 168. 1829.—**Type:** unknown.

Scendent shrubs to woody vines to 8 m. Laminas 6–14 cm long, 3.8–7.5 cm wide, elliptical to broadly lanceolate to sometimes suborbicular, apex apiculate or obtuse-apiculate or acuminate, abaxially very densely stellate-pubescent with a mixture of subsessile to short-stalked hairs [the stalks up to 0.1 (–0.2) mm long, the 7–12 branches 0.02–0.2 mm long] and sessile hairs with 8–12 (–15) branches 0.01–0.1 mm long, the epidermis hidden; with a pair of prominently raised glands (sometimes branched) at the apex of the petiole, each gland 0.1–1 mm long, 0.5–1.5 mm in diameter, or with the pair of glands flush or slightly sunken at base of the lamina, sometimes also with a second prominent pair along the margin near the base, each gland ca 0.5 mm in diameter, or rarely glands absent; adaxially the costa impressed but the secondary veins only slightly so or not at all impressed, abaxially the costa prominently raised, the secondary veins prominent and the tertiary veins indistinct and mostly hidden by the dense indumentum; petioles 0.3–1.8 cm long; stipules 0.5–1.7 mm long, 0.4–0.8 mm wide. Flowers (6–) 10–20 per axis; peduncles (0.5–) 2–4.5 mm long, pedicels (6–) 1–5–14 mm long, pedicels 2.4–9 (–13) times as long as the peduncle; bracts 1.2–2.5 mm long, 0.6–1 mm wide, bracteoles 1–1.5 mm long, 0.4–0.5 mm wide, bracts and bracteoles mostly deciduous during anthesis but frequently some retained in fruit (caducous in specimens from Paraguay). Sepals in flower (5.5–) 6–6.5 mm long, 3.5–5 mm wide, elliptical to broadly elliptical, in fruit (7.5–) 9–11 mm long, (3.5–) 4.5–6 mm wide. Lateral petals: claw 4–5.5 mm long, limb 7–8 mm long, (9–) 10–11 mm wide; posterior petal: claw 2.8–3.5 (–4.5) mm long, limb 7.5–8 mm long, (9–) 10–11 mm wide. Filaments (1.5–) 2–2.3 mm long, anthers of stamens opposing petals 1.5–2 mm long, of those opposing sepals 1.8–2.3 mm long. Anterior style (3–) 4–5 mm long, longer than the posterior two; posterior styles (2.7–) 3.5–4 mm long; stigma 0.3–0.4 mm long. Nutlets 4–4.5 mm high, with a dorsal ridge or winglet up to 1.5 mm wide; outer cotyledon ca 4 mm long, ca 2.5 mm wide, the distal 1/3 folded over the inner cotyledon, inner cotyledon ca 5.4 mm long, ca 2 mm wide, folded over at the distal 4/5. Fig. 2j.

Phenology. Collected in flower from December to June, in fruit from December to July.
Distribution (Fig. 1). Brazil (eastern Minas Gerais and Bahia to Santa Catarina) and eastern Paraguay; along seashore, in restingas, caatingas, woods, and at roadsides; sea level to 1000 m.

Additional Specimens Examined. Brazil. Bahia: Mpio. Jequié, ca 4 km a E de Jequié, Mori & dos Santos 11833 (MICH); Itaberaba, BA-046, Itaberaba/Itacu, a 10 km ao S de Itaberaba, Mori 13427 (MIC, NY); Jequié, Belém & Mendes 202 (UB, US).—Espírito Santo: Vitória-V. Velha, Brade 18083 (RB).—Minas Gerais: ca 5 km NE of Francisco Sá, rd to Salinas, Irwin et al. 23213 (F, MIC, MO, NY, RB, US); Inhapim, 19°30'S, 42°W, Lindeman & de Haas 4572 (NY, WIS).—Paraná: Mpio. Adrianópolis, Col. 7 Barras, Hartschbach 37839 (MIC, MO, NY, SP).—Rio de Janeiro: Rio de Janeiro, Barboza s.n. (BR); Nitheroy, Jurujuba, Brade 216 (GH), 10040 (R), 11364 (US); Itaipuassuí, Brade 14153 (RB); Rio de Janeiro, Burchell 1853 (GH, K); Nouvelle Fribourg, [Oct 1842] Claussen 333 (G); without locality, Claussen 31 (G), Claussen 38 (BM); Rio de Janeiro, Dušen 180 (F, G, US); Rio de Janeiro, Glaziou 723 (BR, K); without locality, Guillemin 33 (G, P); base de Corcovado, le long de l’aqueduc, Guillemin 150 (F, G, NY, P, RB); route de S. Clemente, Guillemin 733 (P); Houlet s.n. (BR); Rio de Janeiro, J. G. Kuhlmann RB15920 (RB); Serra dos Orgãos, Martius 335 (BM, BR, G, GH, K, M, MO, NY, P); without locality, Raben 382 (BR); Rio de Janeiro, Riedel 365 (NY); Faz. Chanaan, Campos, Sampaio 7893 (R); without locality, Schötz s.n. (G), Schüch s.n. (BR); Santa Teresa, Schwacke 2950 (RB); Itapirú, Schwacke 7333 (RB); Praia de Guaratiba, L. B. (G, K, P); Cabo Frio, Vidal R92721 (R); Rio Janeiro, Widgren 741 (BR).—Santa Catarina: Porto Belo, Ponta da Enseada, Cervi 2607 (MBM, MIC); Morro do Ribeirão, Klein 7049 (MICH, P); Müller 188 (K); Sabiní, Vidal Ramos, Reitz & Klein 6561 (MICH, P, US); Capivari bei Tuberão, Ule 1007 (NY-fragment, P, US).—São Paulo: Amparo, de Araujo SP20930 (GH, SP); without locality, Gaudichaud a7 Q).—Ribeira, Hatschbach 2956 (K, MICH, RB); Monte Alegre do Sul, Faz. Nossa Senhora da Encarnação, Kuehn & M. Kuhlmann 1143 (SP), M. Kuhlmann 1785 (SP); Amparo, Recch SP17819 (SP); Estação de Cunha, Viegas et al. RB42113 (RB).—Without locality: Pohl s.n. (M); Pohl d.1539 (BR), Wied Niedwied s.n. (BR).—Paraguay. Alto Paraguay: Collina Yaté, ca 80 km ad meridiem Fuerte Olimpo, Bernardi 20452 (MO).—Amapág: cerca del Parque Nacional Cérfio Corá, junto a Gas Ory, Fernández Casas 6119 (MO, NY); 20 km al N del cruce de Bellavista y Pedro Juan Caballero, Fernández Casas 6184 (MO, NY).—Concepción: zwischen Rio Apa und Rio Aquidaban, Fiebrig 4535 (BM, G, GH, K, M, NY-fragment); entre Paso Horqueta y Concepción, Krapovickas et al. 14231 (MICH); Puerto Fonciere, 10 km al N, sobre Rio Paraguay, Palacios 1949 (MO).

The disjunction between the Paraguayan populations and those from eastern Brazil is surprising; however, the plants do not differ in any aspect. Perhaps additional collections from Paraguay, especially in fruit (none are available now), may reveal characters that would permit recognition of the Paraguayan element at subspecific rank.

Scandent shrubs to woody vines to ca 3 m (fide Moore). Laminas 6.5–12 cm long, 3.5–8 cm wide, elliptical to broadly ovate, apex acuminate or sometimes apiculate, abaxially the younger laminas and the reduced ones near and in the
inflorescence densely stellate-pubescent with a mixture of long- and short-stalked hairs [the stalks 0.01–0.1 mm long, the 6–11 branches (0.04–) 0.1–0.2 (–0.3) mm long] as well as sessile hairs with 8–10 branches (0.01–) 0.03–0.1 mm long, in mature leaves only the stalked hairs retained and the epidermis readily visible; with a prominently raised pair of glands at the apex of the petiole, each gland 0.2–0.5 mm long, 0.7–1.2 mm in diameter, rarely also with a second prominent pair along the margin near the base, each gland ca 0.5 mm in diameter, adaxially the costa impressed but the secondary veins only slightly or not at all impressed, abaxially the costa and secondary veins prominently raised, the tertiary veins prominent; petioles 0.7–2 cm long; stipules 0.7–1 mm long, 0.4–0.5 mm wide. Flowers 10–18 per axis; peduncles 1–3.5 mm long, pedicels 6–13 mm long, pedicels 2.7–6.4 times as long as the peduncles; bracts 1.5–2.8 mm long, 0.5–0.7 mm wide, bracteoles 0.9–1.2 (–1.7) mm long, 0.3–0.4 mm wide, bracts and bracteoles caducous (seen only in youngest parts of inflorescence). Sepals in flower 5.7–7 mm long, (3.5–) 4–5 mm wide, elliptical to broadly elliptical, in fruit 9–11.3 mm long, (3–) 3.5–4.3 mm wide. Lateral petals: claw 4.5–6 mm long, limb 6.5–8 mm long, (9–) 10–12 mm wide; posterior petal: claw 3.5–4 mm long, limb 7.5–8 mm long, (9–) 10–11 mm wide. Filaments 1.7–2.2 mm long, anthers of stamens opposing petals 1.6–2 mm long, of those opposing sepals 2–2.4 mm long. Anterior style 3–3.7 mm long, longer than the posterior two; posterior styles 2.7–3.2 mm long; stigma 0.3–0.4 mm long. Nutlets ca 4 mm high, with a dorsal ridge or winglet to 2 mm wide; outer cotyledon ca 6 mm long, ca 3.5 mm wide, the distal 2/5 folded over the inner cotyledon, inner cotyledon ca 5.5 mm long, ca 2 mm wide, folded over at the distal 2/5. Fig. 2k.

Phenology. Collected in flower in January and February, in fruit in February and May.

Distribution (Fig. 1). Brazil (Mato Grosso do Sul), Bolivia (Santa Cruz), and Paraguay (Alto Paraguay); dry and secondary forest and at roadsides; 100–300 m.

Scandent shrubs to woody vines to 3 m. Laminas 7.5–13.2 cm long, 4.6–10.2 cm wide, elliptical to broadly ovate to rarely suborbicular, apex apiculate or emarginate-apiculate to acuminate, abaxially densely stellate-pubescent with a mixture of short- and long-stalked hairs [the stalks 0.04–0.3 (–0.4) mm long, the 7–13 branches (0.04–) 0.1–0.3 mm long] as well as sessile hairs with 9–19 branches 0.02–0.2 (–0.3) mm long, the epidermis hidden, with a prominently raised pair of glands (sometimes branched, rarely peglike) at the apex of the petiole, each gland 0.3–1 (–2) mm long, 0.7–1.2 mm in diameter, sometimes also with a second prominent pair at the base of the lamina or along the margin near the base, each gland 0.5–1 mm in diameter; rugose, adaxially the costa and veins impressed, abaxially the
costa and veins prominently raised; petioles 0.8–1.2 cm long; stipules 1–1.5 mm long, 0.5–0.7 mm wide. Flowers 12–22 per axis; peduncles 1.5–3.5 mm long, pedicels 8.5–13.5 mm long, pedicels 2.8–6.6 times as long as the peduncles; bracts 1.8–4.5 mm long, 1–1.3 mm wide, bracteoles 1–1.5 mm long, 0.4–0.6 mm wide, bracts and bracteoles deciduous during anthesis. Sepals in flower 5–5.5 mm long, 4.4–4.5 mm wide, elliptical, in fruit (7–) 9–10.5 mm long, 3.5–4.7 mm wide. Lateral petals: claw ca 6 mm long, limb 10–11 mm long, 13–14 mm wide; posterior petal: claw ca 4 mm long, limb ca 10 mm long, ca 13.5 mm wide. Filaments ca 2 mm long, anthers of stamens opposing petals ca 1.8 mm long, of those opposing sepals ca 2.2 mm long. Anterior style ca 3.2 mm long, longer than the posterior two; posterior styles ca 2.7 mm long; stigma 0.3–0.4 mm long. Nutlets 3.5–4 mm high, with a dorsal ridge up to 0.3 mm wide, rarely expanded into a winglet up to 1.5 mm wide; mature seed not seen. Fig. 2i.

Phenology. Collected in flower from January to May, in fruit from March to June.

Distribution (Fig. 1). Brazil (Minas Gerais and adjacent São Paulo); in campo, campo sujo, and at forest edge.

Additional specimens examined. Brazil. Minas Gerais: Mpio. Santa Luzia, Lagôa Santa, Barreto 4768 (F); Mpio. Belo Horizonte, Jardim Botânico, Barreto 7475 (F, UB, US); Mpio. Belo Horizonte, Gوردuras de Cima, Barreto 8680 (UB); Ouro Preto, Campos SP 18840 (SP); without locality, Claussen s.n. (523) in B3B (F, G, GH, NY), Claussen s.n. (40A) in 1840 (BM, BR, G, NY, RB), Claussen 41A in 1840 (BR), Claussen s.n. in 1840 (BR, G, M), Claussen 128 (BM), Claussen 409 (BR), Claussen 413 in 1840 (BM, G), Claussen 585 in 1840 (G), Claussen 587 in 1840 (G), Claussen 1413 in 1840 (BR, G); chemin de la Serra da Piedade, Damazio 861 (G); bords du Rio Parana [sic], Glaziou 18946 (K, P); Caraça, Gounelle s.n. (P); Morro do Pari Lavrado, Heringer 3815 (SP, UB, US); Hêrto Florestal de Paraopeba, Heringer T159 (UB); without locality, Langsdoff & Riedel 781 (NY); Mpio. Belo Horizonte, Mazargão, Roth RB 18088 (RB); without locality, Saint-Hilaire 124AC (P); Sabarà, Vauthier 558 (G, P); Mpio. Nova Lima, Serra da Mutuca, Williams & Assis 5384 (GH); Mpio. Belo Horizonte, Morro das Pedras, Williams & Assis 6329 (GH); Mpio. Belo Horizonte, Resaca, near Pampulha, Williams & Assis 7395 (US).—São Paulo: Via Anhanguera, 1 km S de Ituperava, Hatschbach 42788 (MICH). The type of Thryallis latifolia is said to be from wet places at the large ditch or moat, “Dique,” at the fortification of São Pedro in the city of Salvador Bahia. It is likely that the type was mislabeled. All other collections seen are from Minas Gerais, and Thryallis is not found in wet localities.

Scandent shrubs to woody vines to 10 m. Laminas 6.3–20.5 cm long, 3.2–14 cm wide, elliptical to lanceolate to broadly ovate, apex obtuse-apiculate or apiculate-emarginate to acuminate, abaxially stellate-pubescent with stalked hairs (the stalk 0.1–0.3 mm long, the 7–10 branches 0.04–0.3 mm long, in longer hairs the branches radiating from the apex only, the shorter hairs commonly with a stouter stalk and the branches radiating from along the stalk as well), sessile hairs absent and the epidermis visible; the reduced leaves associated with the inflorescence sometimes pubescent adaxially and densely pubescent abaxially; with a pair of prominently raised to knob- or peglike glands at the apex of the petiole, each gland 0.5–3.5 mm long, 0.5–0.7 mm in diameter, sometimes branched, often also with a second prom-
inent pair at the base of the lamina or along the margin near the base, each gland 0.5–1 mm in diameter; adaxially the costa impressed and the secondary veins less deeply or not at all impressed, abaxially the costa and secondary veins prominently raised, the tertiary veins prominent; petioles 0.6–2 cm long; stipules 0.8–2.3 mm long, 0.4–0.7 mm wide. Flowers (6–) 10–20 per axis; peduncles 0.5–3.5 mm long, pedicels 10–23 mm long, pedicels 4–13 times as long as the peduncles; bracts 1.8–3.2 mm long, (0.4–) 0.6–1 mm wide, bracteoles 1–2 mm long, 0.4 mm wide, bracts and bracteoles usually deciduous early in anthesis, commonly associated only with buds, sometimes retained through fruiting stage. Sepals in flower 4.6–7 mm long, 3.6–5.8 mm wide, broadly elliptical to broadly ovate, in fruit 8.5–10.5 mm long, 3.8–6.5 mm wide. Lateral petals: claw 6–7.5 mm long, limb 7–10 mm long, 11–14 mm wide; posterior petal: claw 3.5–4.5 mm long, limb 9–10 mm long, 11–13 mm wide. Filaments 1.8–2.3 mm long, anthers of stamens opposing petals 1.9–2.2 mm long, of those opposing sepals 2–2.5 mm long. Anterior style 2.9–3.8 mm long, longer than the posterior two; posterior styles 2.6–3.2 mm long; stigma 0.3–0.5 mm long. Nutlets 3.6–4.2 mm high, with a dorsal ridge or winglet up to 1.5 mm wide; outer cotyledon ca 4 mm long, ca 2.1 mm wide, the distal 1/3 folded over the inner cotyledon, inner cotyledon ca 1.5 mm long, ca 1.9 mm wide, folded over at the distal 1/2. Fig. 2a–i.

Phenology. Collected in flower from December to April, and in fruit from December to August.

Distribution (Fig. 1). Eastern Brazil (Ceará, Rio Grande do Norte, Pará, Pernambuco, Bahia, and eastern Minas Gerais; probably also in Alagoas and Sergipe); caatingas, woodlands, roadsides, on limestone and granite; 50–1130 m.

ADDITIONAL SPECIMENS EXAMINED. Brazil. Bahia: 18 km NW of Conceição do Coité on rd to Santaluz, ca 11°30'S, 39°20'W, Anderson 11739 (MICH, MO, NY); 3 km S of Senhor do Bonfim, 10°25'S, 40°10'W, Anderson 11741 (BR, MICH, MO, NY); Mpio. Poções, 2.5 km W of Poções on rd to Bom Jesus da Serra, Anderson 12515 (MICH, RFA); Mpio. Jacobina, 20 km E of Jacobina on rd to Capim Grosso, Anderson 13692 (MICH); Jacobina, Blanchet 3628 (BR, F, G, K, MO, P); Rod. Thryallis parviflora C. Anderson, n. sp.—Type: Brazil. Distrito Federal: Corrego Landim, ca 20 km N of Brasília, gallery forest and creek margin, 950 m, 16 Dec 1965. Irwin 11341 (holotype: RB!, photo: MICH!; isotypes: F! MO! NY! UB! US!).

Differt a Thryalle latifolia petiolo infra apicem 2 (-4) glandulis longe stipitatis (usque 5.5 mm) instructo et petalis parvulis (limbo usque 6 mm longo et 8 mm lato).

Scandent shrubs to woody vines to 5 m. Laminas 8.5-13.5 cm long, 5-9.5 cm wide, narrowly elliptical to elliptical to ovate, apex apiculate or emarginate-apiculate to acuminate, abaxially densely stellate-pubescent with a mixture of short- and long-stalked hairs (the stalks 0.05-0.3 mm long, the 5-8 branches 0.1-0.3 mm long) and sessile to subsessile hairs (stalk up to 0.01 mm long, the 5-8 branches 0.03-0.08 mm long) as well as sessile hairs with 8-12 branches 0.01-0.06 (-0.09) mm long, the epidermis hidden; with a pair of knob- to peglike glands at the apex of the petiole or at the base of the lamina at insertion of petiole, each gland 1.4-5.5 mm long, 0.5-1.4 mm in diameter, sometimes branched and the second pair smaller; rugose, adaxially the costa and veins impressed, abaxially the costa and veins prominently raised; petioles 1-1.8 cm long; stipules 1-2.5 mm long, 0.6-0.8 mm wide. Flowers 12-22 per axis; peduncles 0.5-3 mm long, pedicels 7-11.5 mm long, pedicels 3.1-9 (-17) times as long as the peduncles; bracts 2-4.2 mm long, 1-1.6 mm wide, bracteoles 1.5-2.8 mm long, 0.5-0.8 mm wide, bracts and bracteoles deciduous or persistent during anthesis and sometimes retained in fruit. Sepals in flower 5.5-6 mm long, 3.5-4 mm wide, elliptical, in fruit 8-9 mm long, 3-4 mm wide. Lateral petals: claw 4-5 mm long, limb 4-5.5 (-6) mm long, 6-8 mm wide; posterior petal: claw 2-3.5 mm long, limb 4-5.5 mm long, 6-8 mm wide. Filaments 1.5-2 mm long, anthers of stamens opposing petals 1.7-1.9 mm long, of those opposing sepals 2-2.4 mm long. Anterior style 2.7-3.1 mm long, longer than the posterior two; posterior styles 2.4-2.7 mm long; stigma 0.3-0.4 mm long. Nutlets ca 3.8 mm high, with a dorsal ridge up to 0.2 mm wide; mature seed not seen. Fig. 2m, n.

Phenology. Collected in flower in January, October, and December, in fruit from April to June.

Distribution (Fig. 1). Brazil (Distrito Federal and Goiás); in gallery forest, capoeira, secondary woods, and cerrado; 900-950 m.

Additional Specimens Examined. Brazil. Distrito Federal: Brasília, camino de Fercal, Barroso 609 (RB); Brasilia, Sobradinho, Fercal, Heringer 14262 (K, MICH); Chapada da Contagem, ca 10 km E of Brasilia, Irwin 15733 (MICH); Brasilia, Pires et al. 9304 (UB); Brasilia, Fundação Zoobotânica, Pires et al. 9574 (NY, UB, US); Fêlixlandia para Brasília, Pires 57041 (UB).—GOAS: Mpio. Formosa, JK, Hutschbach 39355 (MICH); Rio Contagem, ca 35 km N of Brasilia, Irwin 15733 (NY, UB); Itumbia, proximo o Rio Paranaiba, Rizzo 8704 (MICH).

ACKNOWLEDGMENTS

I thank William R. Anderson for his comments and suggestions and Edward G. Voss for his advice on nomenclatural matters. Karin Douthit drew the beautiful plate. I am grateful to the curators of the following herbaria for permitting me to study their collections: A, BM, BR, F, G, GH, K, M, MBM, MICH, MO, NY, P, R, RB, RFA, SP, UB, US, WIS.
