University of Michigan
Load

\[ \frac{15}{20k} = R_1 \]
\[ \frac{5}{20k} = R_2 = \frac{2.5}{30k} \]

Shear

\[ 180 \]

Moment

\[ 2437.5 \]
\[ \sum M_{R_1} = 810 \left( \frac{3}{8} \cdot 9 \right) + 2700(9 + \frac{15}{8}) + 1440(\frac{3}{8} \cdot 12 + 24) - R_2(36) = 0 \]
\[ R_2 = 2512.5 \]
\[ \sum M_{R_2} = 810 \left( \frac{3}{8} \cdot 27 \right) + 2700(12 + \frac{15}{8}) + 1440(\frac{3}{8} \cdot 12) - R_1(36) = 0 \]
\[ R_1 = 2437.5 \]

\[ \frac{X}{1627.5} = \frac{15}{2700} \]
\[ x = 9.04 \]

\[ \frac{X^3}{E1} = \frac{2513}{E1} \]

\[ A = B \]
\[ 26804 \approx 26845 \]
\[ \text{OK} \]
DEFLECTION

To find out what the deflection would equal in inches the section (I) and the material (E) must be given — E/I.

For a W16x67:

\[ I = \frac{954}{10^6} \text{ in}^4 \]
\[ E = 29,000 \text{ ksi} \]

\[ \Delta_{\text{max}} = \frac{26,864 \times (1728)}{954 \times 29,000} = 1.7'' \]

Which is \( \frac{L}{257} < \frac{f}{360} \); within limits for span.
