Phagocytic Cells:
Mechanisms of Bacterial Killing and Tissue Injury

J. Fantone, M.D.
2/12/08
9:00-10:00am
Phagocytic Cells: Mechanisms of Bacterial Killing and Tissue Injury

• Learning Outcomes:
  – To understand the pathophysiologic role of phagocytic cells in host defense.
  – To understand the role of reactive oxygen metabolites and lysosomal granules in phagocytic cell function
Phagocytic Cells

• Peripheral Blood Leukocytes (nrml. 4.5-11,000 cells/ul)
  – Lymphocytes (~ 30%)
  – Granulocytes (~ 70%)

• Granulocytes:
  – **Neutrophils** (~ 60% of total leukocytes in blood)
  – Eosinophils (~ 3%)
  – Basophils (<1%, rare)
  – **Monocytes** (~ 6%)

  – Monocytes → Macrophages (tissues)

• Kupffer cells (lining liver sinusoids)
Neutrophil

Source: Undetermined
Monocyte

Source: Undetermined
Neutrophils and Macrophages

• Function:
  – Ingest foreign material
  – Kill bacteria and other microbes
  – Degrade necrotic tissue and foreign antigens

• Tissue damage during prolonged inflammation
Neutrophil Recruitment

Selectins/Addressins $\rightarrow \beta_2$-Integrin/ICAM-1

flow $\rightarrow$ rolling $\rightarrow$ adhesion $\rightarrow$ transmigration

Tissue Injury (e.g. Bacterial infection)

chemoattractant (e.g. IL-8, C5a)

- phagocytosis
- oxidant production
- lysosomal granules

inflammatory mediators

endothelium
Phagocytic Cell Activation: Chemotactic Factors

Other receptors:
- Toll-like receptor
- Mannose receptor
Phagocytic Cell Functional Responses

- Adhesion (localization)
- Chemotaxis (migration)
- Phagocytosis
- NADPH oxidase activation
- Lysosomal granule fusion: degranulation
Opsonization and Phagocytosis

- Fc receptors for antibody
- Complement receptors: (e.g. C3b)
- Other
  - receptors for collectins (e.g. mannose-binding protein)
NEUTROPHIL PHAGOCYTOSIS OF OPSONIZED BACTERIA

C3b Receptor

Fc Receptor

Fc, C3b Binding

Phagosome Formation

Phagolysosome

Source: Undetermined
cell phagocytosis

- Oxygen radicals
- Elastase
- Collagenase
- Acid hydrolases

Source: Undetermined
Respiratory Burst: NADPH Oxidase

Oxygen Levels (% of max.)

TIME (minutes)

Stimulus added

patient

normal
Reactive Oxygen Metabolites

Superoxide anion: $\text{O}_2^-$ 
$\text{O}_2 + e^- \rightarrow \text{O}_2^-$

Hydrogen peroxide: $\text{H}_2\text{O}_2$
$2\text{O}_2^- + 2\text{H}^+ \rightarrow \text{H}_2\text{O}_2 + \text{O}_2$

Hydroxyl radical: $\text{OH}^.$
$\text{H}_2\text{O}_2 + \text{Fe}^{2+} \rightarrow \text{OH}^\cdot + \text{OH}^- + \text{Fe}^{3+}$

Hypochlorous acid: $\text{HOCl}$
$\text{H}_2\text{O}_2 \rightarrow \text{HOCl} + \text{OH}^-$

myeloperoxidase $=$ MPO

Chronic Granulomatous Disease of Childhood (CGD): deficiency of NADPH Oxidase
Nitric Oxide (NO $\cdot$) Synthase

L-arginine $\rightarrow$ NO $\cdot$ $\rightarrow$ hydroxyl radical

- Endothelial cell
- Macrophages (inducible): intracellular cytotoxic agent
- Nervous system
Oxidant Targets

a) unsaturated lipids: lipid peroxidation
   LOOH = lipid hydroperoxides

c) proteins
   - sulfhydryl groups
   - methionine
   - tyrosine

d) nucleic acids
Degranulation

- Bactericidal proteins (e.g. defensins)
- Proteases
  - serine proteases (e.g. elastase)
  - metalloproteininases (e.g. collagenase, gelatinase)
- Acid hydrolases
Source: Undetermined
Protective Mechanisms

Anti-oxidant: specific vs. non-specific

**Specific enzymes:**

**Superoxide dismutase:** \( 2\text{O}_2^- + 2\text{H}^+ \rightarrow \text{H}_2\text{O}_2 + \text{O}_2 \)

**Catalase:** \( 2\text{H}_2\text{O}_2 \rightarrow 2\text{H}_2\text{O} + \text{O}_2 \)

**Glutathione peroxidase:** \( \text{H}_2\text{O}_2 + 2\text{GSH} \rightarrow 2\text{H}_2\text{O} + \text{GSSG} \)

\( \text{LOOH} + 2\text{GSH} \rightarrow \text{H}_2\text{O} + \text{LOH} + \text{GSSG} \)

LOOH = lipid hydroperoxides
GSH = reduced glutathione
GSSG = oxidized glutathione
Non-specific scavengers:

- Vitamin E
- Vitamin C
- Beta-carotene
Anti-proteases

- α-1- anti-protease (anti-trypsin):
  - plasma protein
  - binds proteases including elastase
  - inactivated by oxidants

- α-2- macroglobulin
  - plasma protein
  - binds proteases

- TIMPs: tissue inhibitors of metalloproteinases
  - cell derived
Synergism: Inactivation of alpha-1-Anti-trypsin

1. HOCl Dependent
PMNs → HOCl

2. Metalloproteinase Dependent
PMNs → Metalloproteinase (collagenase)
Case: A 3 year old boy is brought to the emergency department

• **CC:** a productive cough, fever (temp 102.1 C), and headache.

• **PEx:** healthy boy with rales present on auscultation of the left lower chest.

• **CxR:** intra-alveolar infiltrate in the left lower lobe.

• **Hx:** mother reports multiple episodes (approx. 5 per year) of recurrent bacterial infections including otitis media, sinusitis, pneumonia, and purulent skin lesions. These infections usually responded to antibiotic treatment.
List three different mechanisms that could account for this patient's increased susceptibility to bacterial infection:

1. 

2. 

3. 

Neutrophil Recruitment

Selectins/Addressins $\rightarrow B_2$-Integrin/ICAM-1

flow $\rightarrow$ rolling $\rightarrow$ adhesion $\rightarrow$ transmigration

Tissue Injury (e.g. Bacterial infection)

- inflammatory mediators
- chemoattractant (e.g. IL-8, C5a)
- phagocytosis
- oxidant production
- lysosomal granules

endothelium
Different mechanisms that could account for this patients increased susceptibility to bacterial infection:

1. Lack of neutrophils: leukopenia
2. Defective neutrophil function
   - Adhesion / migration
   - Phagocytosis
   - Bacterial killing
3. Lack of chemoattractants: deficiency
4. Lack of opsoninization of bacteria
   - antibody deficiency / complement def.
