Medical relevance of the one-carbon pathways
Mechanism of antibiotics
Sulfa drugs - antibacterial
Trimethoprim, pyrimethamin - antibacterial, antimalarial
Pathologies
VitB₁₂ deficiency/pernicious anemia
dietary folate deficiency
sprue
(See also the Nucleic Acid lectures for anti-cancer chemotherapies)

I. Tetrahydrofolate as a carrier of one-carbon units

A. Obtaining folate - an essential vitamin

1. Dietary sources (green veggies, fortified cereals, liver) provide folic acid. Cleaved by enzyme 'conjugase' to remove extra glutamate residues, absorbed, reduced to dihydrofolate, then to tetrahydrofolate by Dihydrofolate Reductase (DHFR). DHFR inhibitors are useful antibiotics if they affect other organisms but not humans.

2. Inhibitors of DHFR are used therapeutically: e.g. methotrexate (cancer chemotherapy). Tumors that resist methotrexate sometimes have amplified the DHFR gene to compensate for the inhibitor.
3. Compounds that inhibit bacterial folate biosynthesis can be excellent antibiotics. Example: sulfa drugs like sulfanilamide:

![Para-aminobenzoic acid (PABA)](image)

![sulfanilamide](image)

B. Main entry of one-carbon units - \(N^5, N^{10}\) methylene tetrahydrofolate

1) Serine conversion to glycine:

![Diagram of serine conversion to glycine](image)

2) Glycine conversion to \(\text{CO}_2\) and \(\text{NH}_4^{(+)}\):

![Diagram of glycine conversion to \(\text{CO}_2\) and \(\text{NH}_4^{(+)}\)](image)

C. Oxidation states of the one-carbon unit and inter-conversions (reversible reactions indicated by double-ended arrows)

![Diagram of oxidation states of the one-carbon unit and inter-conversions](image)
II. S-adenosylmethionine ('SAM', aka 'AdoMet') Overview:

\[ \text{Methionine} \rightarrow \text{S-Adenosyl Methionine} \rightarrow \text{Homocysteine} \]

\[ \text{S-Adenosyl Homocysteine} \rightarrow \text{Methyl acceptor} \]

\[ \text{Methylated acceptor} \rightarrow \text{Methyl acceptor} \]

\[ \text{Biosynthetic Methylation reaction} \]

\[ \text{tetrahydrofolate} \]

\[ \text{NS methyl tetrahydrofolate} \]
A. Biosynthesis of methionine
(see also the Amino Acid Metabolism handout)

\[
\begin{align*}
\text{homocysteine} & \xrightarrow{\text{N}^5\text{-methyl THF}} \text{vitamin B}_{12} \xrightarrow{\text{THF}} \text{methionine} \\
\end{align*}
\]

B. Re-utilization of folates:

\[
\begin{align*}
\text{Tetrahydrofolate} & \xrightarrow{\text{Carbon donor (e.g. serine or glycine)}} \text{N}^3, \text{N}^{10} \text{ methylene tetrahydrofolate} \\
\text{methionine} & \xrightarrow{\text{NAD}^+ + H^+} \text{N}^5 \text{ methyl tetrahydrofolate} \\
\text{homocysteine} & \xrightarrow{\text{NADH} + H^+} \text{methionine} \\
\end{align*}
\]

C. Synthesis of S-Adenosyl Methionine

\[
\begin{align*}
\text{methionine} & \xrightarrow{\text{ATP}} \text{S-adenosyl methionine} \\
\text{S-adenosyl methionine} & \xrightarrow{\text{PP} + \text{P}_i} \text{methionine} \\
\end{align*}
\]

D. Uses of SAM - biological methylator
Example: Conversion of norepinephrine to epinephrine:

Others: Conversion of phosphatidylethanolamine to phosphatidylcholine, methylation of mRNA and DNA

E. AdoMet cycle

III. Pathologies:
A. Folate deficiency is common. symptom: megaloblastic anemia
weakness, anemia, anorexia
Appearance of large, immature erythrocytes ('megaloblasts') in the blood

B. several causes:
- dietary deficiency common
- alcoholism may compound folate deficiency
- inability to absorb folates (e.g. *tropical* sprue and non-tropical or *celiac* sprue)

Dietary folates are typically poly-glutamated (up to 6 γ-glutamyl residues)
We can absorb only the mono-glutamyl form
An enzyme 'conjugase' secreted by the brush border cells of the intestine
hydrolytically removes the extra glu residues so we can absorb the folate
Intestinal irritation can compromise production of conjugase

- possibly secondary to B12 deficiency: pernicious anemia

'Methyl trap' hypothesis and deficiency of vitamin B12:

![Diagram of folate metabolism]

B12 deficiency can be caused by autoimmune response to 'Intrinsic Factor', a product of the gut that aids in the absorption of B12.
