Learning Objectives

After this lecture you should have an understanding of:

• The feedback loops regulating cortisol secretion.
• The physiologic actions of glucocorticoids (cortisol) + mineralocorticoids (aldosterone)
• The major pharmacologic uses of glucocorticoids.
• The major types of glucocorticoids.
• The major side effects of glucocorticoid therapy.
Anatomy of the adrenal glands
Histology of the Adrenal Gland

Adrenal cortex:
- zona glomerulosa (aldosterone)
- zona fasciculata
- zona reticularis

Adrenal medulla (catecholamines)

Capsule

‘Roids: The Bottom Line

In the right amounts, steroids can be the body’s best friend….

or

in the wrong amounts, the body’s worst enemy….
Role of Glucocorticoids in Human Physiology

In the right amounts, glucocorticoids keep:

- Your blood pressure up (maintain cardiovascular stability).
- Your blood sugar up (maintain metabolic homeostasis).
- Your disposition sunny (maintain integrity of CNS function).
- Your temperament cool (regulate response to stress).

Glucocorticoid Effects on Protein Metabolism

**Insulin**
- ↑ Anabolism (storage)
- ↑ Protein synthesis
- ↓ Protein breakdown
- ↓ Amino acid release

**Glucocorticoids**
- ↑ Catabolism
- ↓ Protein synthesis
- ↑ Protein breakdown
- ↑ Amino acid release
Glucocorticoid Effects on Lipid Metabolism

**Insulin**
- ↑ Anabolism (storage)
- ↑ Lipid synthesis
- ↓ Lipolysis
- ↓ Fatty acid release

**Glucocorticoids**
- ↑ Catabolism
- ↓ Lipid synthesis
- ↑ Lipolysis
- ↑ Fatty acid release

Redistribution of fat
Redistribution of Fat in Glucocorticoid Excess

Central obesity seen in Cushing’s Syndrome (Glucocorticoid Excess)
Glucocorticoid Effects on Inflammatory Mediators

Glucocorticoids INHIBIT inflammation.

1) Arachidonic acid and its metabolites (prostaglandins; leukotrienes)
2) Platelet activating factor (PAF)
3) Tumor necrosis factor (TNF)
4) Interleukin-1 (IL-1)
5) Plasminogen activator
Sites of Action of Glucocorticoids in the Responses of Leukocytes During Antigenic Challenge/Inflammation
Glucocorticoids

Clinical Uses of Glucocorticoids
Steroid Therapy: Routes of Administration

- Systemic
  - Oral
  - Parenteral
- Topical
- Inhalation
Clinical Uses of Glucocorticoids

- Replacement therapy
- Anti-inflammatory effect
- Immunosuppression
- Androgen suppression
Emily Janz, a 36-year old woman presents with a 3-year history of rheumatoid arthritis. The disease has been progressive with involvement of PIP joints in both hands, wrists, elbows and TM joints. Treatment with non-steroidal anti-inflammatory drugs (NSAIDs) has not been successful. Treatment with prednisone is begun using an alternate-day program.
A 25-year old man was walking through a field when he was stung by an insect. He developed generalized edema, dyspnea, wheezing and dizziness. He was rushed by a friend to the emergency room, where a diagnosis of anaphylactoid reaction to insect bite was made.

He received a large dose of steroids parenterally and was subsequently advised on a program to taper the steroids over the next one week.
James Allen, a 55-year old man with a history of ischemic cardiomyopathy develops increasingly severe congestive heart failure. When he becomes totally incapacitated with a life-expectancy of less than 6 mo., he is placed on the cardiac transplantation list.

Two months later, he receives a heart and is subsequently placed on an immunosuppressive “cocktail” that includes prednisone, 5 mg daily.
A 25-year old woman comes in for evaluation of hirsutism present over the past 3 years. The hirsutism is of the androgen type and is associated with acne and irregular menses. Diagnostic studies reveal elevated serum dehydroepiandrosterone (DHEA) and testosterone levels.

She receives Dexamethasone 2.0 mg daily, for seven days and serum DHEA and testosterone levels are measured the 8th day.

RULES
Glucocorticoid Therapy

Side Effects

Or

“Yes, Virginia, there can be at times ‘Too Much of a Good Thing…’”
Glucocorticoid Effects on Calcium & Bone

STEROIDS → "BRITTLE BONES"

↓ Osteoblastic activity
↓ Calcium absorption from gut.
↑ PTH secretion
↑ Osteoclastic activity
A 60 yo postmenopausal woman was seen in clinic with acute onset of mid-thoracic back pain. She had complained of back pain for the past 2 years and a 2” loss of height. She had been on Prednisone, 10-15 mg daily, for the past 5 years for chronic polymyositis. Radiographic exam of the spine shows compression deformities in several vertebral bodies.
Chronic glucocorticoid therapy may "unmask" diabetes in genetically susceptible individuals.
Glucocorticoid Effects on the Central Nervous System

- Neuronal death or atrophy
- Structures affected: Hippocampus, caudate
- Neuropsychiatric symptoms:
  - Cognitive- memory, learning
  - Mood- irritability, depression
  - Sleep- insomnia
A 42-yo woman with an exacerbation of lupus nephritis was treated with high-dose prednisone for several days. Her nephritis improved markedly; however, she became increasingly euphoric and severely agitated with paranoid ideation and confusion.

Following tapering of the steroid, she returned to her “usual self.”
Glucocorticoid therapy may increase risk of ulcers.

- ↑ Secretion of HCl and pepsin
- ↓ Protective barrier in the gastric mucosa
Complications of Chronic Exogenous Corticosteroid Use

CRH → ACTH → Adrenal Gland → Cortisol

Hypothalamus (−)
Pituitary (−)

(+)

Adrenal Gland
Complications of Chronic Exogenous Corticosteroid Use

Exogenous glucocorticoids suppress ACTH-stimulated cortisol secretion.
Complications of Chronic Exogenous Corticosteroid Use

ACTH is normally a trophic factor for the adrenals

High-dose, long-term glucocorticoid use results in adrenal atrophy from ACTH suppression
Complications of Chronic Exogenous Corticosteroid Use

- **Exogenous Glucocorticoid**
- CRH
- ACTH
- Adrenal Gland
- Pituitary
- Hypothalamus
- Adrenal Insufficiency

The diagram illustrates the role of CRH and ACTH in the hypothalamic-pituitary-adrenal (HPA) axis. Exogenous glucocorticoids suppress the production of CRH and ACTH, leading to decreased cortisol production and adrenal insufficiency.
Full recovery of endogenous cortisol secretion may require up to 18 months following steroid withdrawal.

Source: Undetermined
Case #1

A 45-year old woman present with a two-month history of anorexia, nausea, fatigue, dizziness when assuming the upright posture, and increased pigmentation of the skin.

A diagnosis of Addison’s disease (Cortisol and Aldosterone deficiency) is confirmed by appropriate testing.

Treatment is initiated with Cortisol 25 mg. (10/10/5) and 9-α fluorocortisol 0.05 mg QD.
Corticosteroid Therapy Considerations

- How serious is the underlying disorder?
- How long is therapy required?
- What is the anticipated effective dose range?
- Is patient predisposed to complications?
- Which preparation to use?
- Alternate day v. every day therapy.
- Program for withdrawal.
Complications with Prolonged Steroid Therapy

- Retarded longitudinal growth in children*
- GI Bleeding
- Osteoporosis*
- Diabetes*
- Cushing’s Syndrome

- Steroid myopathy
- Hypertension
- Cataracts
- Psychiatric
- Adrenal suppression*

*Complications to remember
Things to Remember if Dr. Lash put you to sleep and you’re just waking up…:

Understand:

• Feedback loops regulating cortisol secretion.

• The major physiologic actions of glucocorticoids (cortisol) and mineralocorticoids (aldosterone).

• The major pharmacologic uses of glucocorticoids.

• The major types of glucocorticoids--hydrocortisone, prednisone, dexamethasone, 9-a-fluorocortisol.

• The major side effects of glucocorticoid therapy.
Questions?
Goals/Objectives

- Remember the basic principles of the HPA axis: homeostatic control of plasma cortisol and aldosterone levels
- Remember the mechanism of action of glucocorticoids and mineralocorticoids
- Understand etiology, clinical features, differential diagnosis, evaluation and therapy of 3 classic adrenal disorders:
  - Adrenal Insufficiency
  - Cushing’s Syndrome
  - Primary Hyperaldosteronism
Which Twin is Sick???
Adrenal Glands in Medical History

Andreas Vesalius (1543)
Book Five of De Corporis Humani Fabrica in 1543

Bartholomäus Eustachius (1564)
glandulae quae renibus incumbent” in 1564
History of Adrenal

- **1716: Academie des Sciences of Bordeaux poses the question**
  "Quel est l'usage des glandes surrenales?"

- **1845: French thesis on organs of Undetermined function**
  "The adrenal cease(s) to be a secreting gland."

- **1855: Thomas Addison monograph**
  "On the constitutional and local effects of disease of the supra-renal capsules," described 10 cases marked by "anemia . . . feebleness of the heart action . . . a peculiar change of color in the skin occurring in connection with a diseased condition of the 'suprarenal capsules'."

- **In 1945 Nobel Prize**
  Kendall, Pfiffner, and Reichenstein first tested adrenal extracts on a patient with Addison's disease, and the response was prompt and striking.

Adrenal
Definition of Adrenal Insufficiency

- “inappropriately low” adrenal steroid output
  - mineralocorticoids (aldosterone)
  - glucocorticoids (cortisol)
  - sex steroids (DHEAS)
How Frequent Is Adrenal Insufficiency?

- In general, about 40-60 per million individuals have adrenal insufficiency
- 30,000-34,000 people in U.S.
Types of Adrenal Insufficiency

- PRIMARY: Adrenal Gland (CRH → (+) ACTH) → Hypothalamus (−) → Pituitary (−) → Cortisol
- SECONDARY: Hypothalamus (−) → Pituitary (−) → Adrenal Gland (CRH → (+) ACTH) → Cortisol
- TERTIARY: Adrenal Gland (CRH → (+) ACTH) → Hypothalamus (−) → Pituitary (−) → Cortisol
Adrenal Insufficiency

1° adrenal insufficiency
- hypothalamic CRH
- pituitary ACTH
+ adrenal cortisol

adrenal defect

2° adrenal insufficiency
+ hypothalamic defect
- pituitary defect

adrenal aldosterone
Adrenal Insufficiency: Age Dependent Prevalence

Mean age 40 yo (range 17-72 yo)

Autoimmune adrenalitis most common in all age groups

- Children: consider PGA or genetic defect
- Young men: adrenoleukodystrophy
- Adults and elderly: glucocorticoids for non-adrenal diseases
Types of Adrenal Insufficiency

- **Primary Adrenal Insufficiency**
  - Hypothalamus: (-)
  - Pituitary: (-)

- **CRH** increases in the Hypothalamus.
- **ACTH** decreases in the Pituitary.
- **Adrenal Gland** decreases negatively.
- **Cortisol** decreases.

**PRIMARY**
PRIMARY Adrenal Insufficiency

- Autoimmune adrenalitis (PGA I or II) 80%
- Infections: TB (20% - historically), CMV, fungal
- Vascular: hemorrhage, thrombosis, arteritis
- In cancer patients: metastatic cancer to adrenals
- In young men: adrenoleukodystrophy

IMPORTANT: In PRIMARY adrenal insufficiency, the adrenals are destroyed, and ALDOSTERONE is affected as well.

Thomas Addison (1793-1860)
Adrenal Insufficiency

BY: University of Alabama at Birmingham, Department of Radiology

CC:BY-NC-SA
BY: University of Alabama at Birmingham, Department of Radiology
Adrenoleukodystrophy/Adrenomyeloneuropathy

X-LINKED - ONLY IN MALES

PRESENTATION
- adrenal insufficiency (childhood)
- hypergonadotropic hypogonadism (puberty)
- spastic paraparesis/demyelination - AMN (20-30 yo) vs cerebral sclerosis - ALD (childhood)

PATHOPHYSIOLOGY: mutation in Adrenoleukodystrophy protein (ALPD)

ALPD function - pexosomial transport protein anchors very long chain AcylCoA synthetase

DISEASE - build up of chol. esters w unbranched saturated long chain FAs

TREATMENT: Cortisol replacement

Lorenzo’s Oil helps serum level of VLCFA - but no clinical benefit in 3 yr F/U

MUST BE INCLUDED IN w/u of Al in young men and in w/u Al or hypoglycemia in infants
Primary Adrenal Insufficiency

Autoimmune adrenalitis results in ADRENAL INSUFFICIENCY

Autoimmune adrenalitis (and therefore its subsequent ADRENAL INSUFFICIENCY) can be found in specific genetic syndromes, POLYGLANDULAR AUTOIMMUNE SYNDROMES.
Primary Adrenal Insufficiency

PGA I (Polyglandular Autoimmune Syndrome I)
autosomal recessive disease- Iranian Jewish heritage starting in childhood

APECED (Autoimmune Polyendocrinopathy-Candidiasis-Ectodermal Dystrophy)
autosomal recessive-Finnish heritage starting in childhood

2 of the following
- adrenal insufficiency (<15 yo)
- hypoparathyroidism (<10 yo)
- chronic mucocutaneous candidiasis (<5 yo)

PLUS OFTEN
- dental enamel hypoplasia
- keratopathy/ecdodermal dystrophy

occasionally
- chronic active HepB
- malabsorption
- cholelithiosis
- juvenile onset pernicious anemia
- alopecia/vitiligo
- primary hypogonadism
- hypothyroidism
- diabetes mellitus

AIRE (AutoImmune REgulator) Nat Gen 17: 393398; 399-403
Which Twin is Sick????
Famous Names in Endocrinology

Addison’s Disease

John F. Kennedy  Jane Austin (1775-1817)
Addison’s Disease & History

1960 Presidential Debate
John F. Kennedy vs. Richard M. Nixon
Chicago, Ill., September 21, 1960
Adrenal Insufficiency

Autoimmune adrenalitis

- PGA II
  - usually in middle age females
  - adrenal insufficiency
  - hyothyroidism or diabetes mellitus
  - *uncertain genetic component
  - autosomal dominant more likely
  - HAL-B8 chromosome 6

- PGA III
  - hypothyroidism
  - other autoimmune disorder (NOT adrenal insufficiency)
Primary Adrenal Insufficiency

SYMPTOMS

Cortisol
- Fatigue
- Weakness & Malaise
- Anorexia
- Nausea and vomiting

Aldosterone
- Dizziness

SIGNS
- Proximal muscle weakness
- Orthostatic hypotension
- HYPERPIGMENTATION—Primary AI only
- HypoNa, HyperK—Primary AI only
Hypoaldosteronism

- cholestrol
- pregnenolone
- DOCs
- progesterone
- 18OHCs
- CS
- aldosterone
- p450c11B2
- p450c11B2-18OH
- p450c21
- 3ßHSD
- sTaR

Symptoms:
- Hypotension
- Hyperkalemia
- Hyponatremia
Primary Adrenal Insufficiency

(ALDOSTERONE DEFECT ONLY SEEN IN PRIMARY AI not SECONDARY AI)

Aldosterone increases sodium resorption and potassium and hydrogen ion excretion.

So, with aldosterone deficiency:

\[
\begin{align*}
\text{Na}^+ & \quad \text{Cl}^- \\
\uparrow & \quad \downarrow \\
K^+ & \quad \text{HCO}_3^-
\end{align*}
\]
Glucocorticoid Deficiency

- Hypotension
- Fatigue
- Hypoglycemia

Cholesterol → sTaR → Pregnenolone → 3ßHSD → Progesterone → 17OHprogesterone → p450c21 → DOC → Cortisol

- p450c11B1 → 3ßHSD → 17OHprogesterone → DOC → Cortisol

- Fatigue
- Hypotension
- Hypoglycemia
DHEAS Deficiency

- **Male:** fatigue, △ mood
- **Female:** fatigue, △ mood, libidinal dysfunction

---

**Chemical Pathway:**

1. **Cholesterol** → **P450c17** → **Pregnenolone** → **17αOH-Pregnenolone** → **DHEA**

2. **17αOH-Pregnenolone** → **17αOH-Pregnenolone** → **3βHSD** → **Progesterone**

3. **DHEA** → **Sulfatase** → **DHEA-Sulfate**

4. **Progesterone** → **17αOH-Progesterone** → **17αOH-Progesterone** → **3βHSD** → **Androstenedione**

---

**Enzymes Involved:**

- **Sulfotransferase**
- **17α,20β-Lyase**
- **P450c17**
- **3β-Hydroxysteroid Dehydrogenase (3βHSD)**
T. Addison

TERTIARY

Adrenal Gland

(+)

(-)
Secondary & Tertiary Adrenal Insufficiency

- Vascular: Postpartum necrosis (Sheehan’s)
- Lymphocytic hypophysitis
- Infiltrative diseases: Sarcoidosis, Histiocytosis X
- Tumor compression
- Following surgery or radiation

- Long term glucocorticoid treatment
  Pharmacologic Dose = more than physiologic replacement
Secondary Adrenal Insufficiency

**SYMPTOMS**
- Mild malaise, fatigue
- Proximal muscle weakness

**SIGNS**
- NO hyperpigmentation
- NO orthostatic hypotension

SIGNS & SYMPTOMS are generally milder than with primary adrenal insufficiency due to cortisol deficiency ALONE (ie: NO ALDOSTERONE DEFICIENCY)
Adrenal Insufficiency

REMEMBER TO DIFFERENCE BETWEEN PRIMARY AI AND SECONDARY AI

**PRIMARY ONLY**
- hyperpigmentation (92-96%)
- HYPERkalemia (52-64%)

associated features (ie can see if PGA)
- vitiligo (4%)
- hypothyroidism (primary)
- hypogonadism (primary)

**SECONDARY ONLY**
- growth delay
- HA
- DI (if stalk involved)
- hypothyroidism (secondary)
- hypogonadism (secondary)
Adrenal Crisis

- *hemorrhage
- thromboembolic disease
- Coagulopathy
- anticoagulant therapy
- Waterhouse-Friderichsen Syndrome
  - Neisseria meningitidis septicemia
  - Streptococcus pneumoniae,
  - Pseudomonas aeruginosa
  - Staphylococcus aureus
  - Escherichia coli
  - Haemophilus influenzae
- *drugs - increase metabolism GC
  - phenytoin, phenobarbitol, rifampin
- *drugs - decrease production GC
  - ketoconazole, AG, mitotane, metyrapone
- *withdrawal of exogenous glucocorticoids
Adrenal Crisis

- **suspect in setting of:**
  - catecholamine resistant hypotension
  - hypotension with abd pain
  - must r/o adrenal hemorrhage

- **look for:**
  - hyperpigmentation/decreased pubic hair
  - hyperkalemia
  - hyponatremia
  - hypoglycemia

If the diagnosis is missed, your patient will most likely die
SCREENING TEST:

AM CORTISOL: GOAL is to RULE OUT disease

Principle of test: Cortisol is highest in the AM allowing maximal chance of ruling out disease

- HI AM cortisol RULES OUT DISEASE

- BUT ONLY EXTREMELY LOW AM cortisol is DIAGNOSTIC

Most patients are neither EXTREMELY HI or EXTREMELY LOW and require DYMANIC testing
Diabetic Adrenal Insufficiency Diagnostic

**DIAGNOSTIC TEST FOR PRIMARY ADRENAL INSUFFICIENCY:**

**ACTH STIMULATION TEST:** GOAL is to RULE IN disease

Principle of test: ACTH stimulates steroidogenesis and secretion of cortisol - normal levels well documented

- Cortisol level after ACTH that is SUBNORMAL is DIAGNOSTIC of AI
- ACTH level that is EXTREMELY HI is CONSISTENT with diagnosis of PRIMARY AI
  but is NOT DIAGNOSTIC
The ACTH Stimulation Test

**NORMAL**

- CRH stimulates ACTH from the Pituitary.
- ACTH stimulates Cortisol from the Adrenal Gland.
- Serum Cortisol increases.

**ADRENAL INSUFFICIENCY**

- CRH stimulates ACTH from the Pituitary.
- No or blunted increase in serum cortisol.

**Synthetic ACTH (Cosyntropin)**

- CRH and ACTH are synthetically induced.
- Cortisol production is measured.

Hypothalamus

(-)  Pituitary

Adrenal Gland

(+)  (+)
Adrenal Insufficiency Diagnostic

**DIAGNOSTIC TEST FOR SECONDARY ADRENAL INSUFFICIENCY:**

**INSULIN HYPOGLYCEMIA TEST:** GOAL is to RULE IN disease

Principle of test: Insulin results in hypoglycemia that is the strongest stimulus for activation of HPA axis at the level of CRH

Cortisol level after IHT that is SUBNORMAL is DIAGNOSTIC of AI

ACTH level after IHT that is SUBNORMAL is DIAGNOSTIC of SECONDARY AI
Diagnosis of Secondary/Tertiary Adrenal Insufficiency

The Insulin Tolerance Test

Insulin-induced hypoglycemia is a powerful stimulus of the HPA axis
Therapy for Adrenal Insufficiency

Image of adrenal gland removed

Therapy

Image of adrenal gland removed
Guidelines for Management

**Guiding Principle:** The more severe the stress the more cortisol patient needs. Do not wait for labs!!!!

**Acute Therapy (significant ill or Adrenal Crisis)**
- IV fluids
- IV cortisol: HI DOSE
- Glucose
- Treat underlying precipitating events

**Maintenance Therapy**

**Glucocorticoids**
- Hydrocortisone ~ 15-25 mg/d
  - Titrate to a sense of well being and physical strength
  - Avoid weight gain, hypertension, hyperglycemia and osteoporosis

**Mineralocorticoids**
- Fludrocortisone ~0.1 mg/d
  - Titrate to salt craving and postural hypotension
  - Together with serum K and upper range renin

**DHEA**
GUIDING PRINCIPLE: The more severe the stress the more cortisol patient needs!

**Stress Dosing Glucocorticoids**

**Minimal**
- no need for supplemental coverage
  - dental work
  - mild or non-febrile illness

**Minor**
- 25 mg hydrocortisone - day of procedure (or onset of fever)
  - hernia repair
- rapid taper in 1-2 days
  - hemicolecotomy
  - significant febrile illness

**Moderate**
- 50-75 mg hydrocortisone - day of procedure (or onset of fever)
  - cardiac surgery
  - rapid taper in 1-2 days

**Severe**
- 100-150 mg hydrocortisone - day of procedure (or onset of fever)
  - rapid taper in 1-2 days
  - sepsis

**Critically ill**
- 100 mg hydrocortisone i.v. bolus followed by -
  - 50-100 mg hydrocortisone i.v. q 6-8 hours (or 0.18 mg/kg/hr)
  - 0.05 mg/d fludrocortisone until shock resolves (days to week)
Discontinuing Glucocorticoids Following Long Term Suppression

GUIDING PRINCIPLE: The more glucocorticoid and the longer treated - the greater chance of long term suppression and atrophy of HPA axis

**Risk of suppression**
Low risk: Low dose, short duration or short “bursts” of glucocorticoid
High dose and prolonged therapy (≥ 1-4 weeks) - risk is higher

**Time course for recovery**
Larger doses for prolonged periods (months - years) - recovery can take from 9 MONTHS up to 1-2 years

**Need for taper**
taper from pharmacologic to physiologic (determined by non-adrenal disease course)
taper from physiologic to no treatment (determined by adrenal suppression)
DHEA: What is all the fuss?

- Marker of aging
  - Pharmacologic reversal of aging process
- Predictor of morbidity/mortality
- Works wonders in rodents
  - CNS, obesity, diabetes, immunity
- Preliminary studies in humans
DHEA
what is it??

- **Synthesized by adrenals only in humans and higher primates**
  - Obligate precursor of all sex steroids in humans

- **More synthesized than all other steroids**
  - Up to 25 mg/day in adults
  - Major secretion of fetal adrenal

- **Most secreted as sulfate (DHEA-S)**
  - Sulfation is **ONLY** in ADRENAL (NOT GONAD)

- **Inactive at androgen receptor**

19 carbon (androstan)\(\Delta^5, 3\beta\)-hydroxy, 17-keto
SO\(_4\), ester at 3\(\beta\)

Source: Undetermined
DHEA: How Does it Work?

- **Conversion to androgens**
  - 50 mg/d raises testosterone in females

- **Intrinsic activity of DHEA-S in brain**
  - trophic effects on cultured neurons
  - GABA, NMDA, sigma receptor-channels

- **Actions of weird metabolites**
  - concept of NEUROSTEROIDS
Case for DHEAS

DHEA + DHEAS

major secretory products of adrenal peak in fetal life and adrenarche

Decline throughout adult life to 20-20% by 70-80 yo

Advertisement as ANTI-AGING drug
In USA : FOOD SUPPLEMENT!!!!!!

classic steroid converted to testosterone peripherally
neurosteroid directly binding NMDA + GABA receptors
DHEA replacement in women with adrenal insufficiency improved overall well-being and mood, specifically depression, anxiety and both sexual interest and sexual satisfaction.

DHEA in men and women with primary adrenal insufficiency improves mood and well-being, irrespective of the patient’s sex.
Adrenal Androgens

only in pts w AI who do NOT feel “normal on replacement GC and MC”

DHEA: 25 mg po q a.m.

-may increase to 50 mg
-dictated by response and androgenic side effects
-monitor labs

DHEAS, androstendione and free test LFTS and lipids at 4 + 12 w
Watch Out for Supplements

Steroids are lipophilic
Undetermined dosing
Undetermined purity
Congenital Adrenal Hyperplasia

- Genetic block in biosynthetic pathway for cortisol and aldosterone result in primary adrenal insufficiency.
- Decreased feedback on hypothalamus and pituitary increase CRH and ACTH.
- Increased ACTH further stimulates adrenals and results in shunting and production of precursors.
- ACTH stimulates growth (HYPERPLASIA) of adrenals.

**Diagram:**

gonad periphery

cholesterol → pregnenolone → 17OHpregnenolone → 17α-HSD → DHEA → 17β-HSD → androstenediol → 17β-HSD → testosterone

17α-HSD → 17β-HSD → progesterone → 17α-HSD → 17αOHprogesterone

DHEA-Sulfatase → DHEA → androstenedione → 17α-HSD → testosteron

p450c11B2 → 18αHSD → aldosterone

p450c11B2-18OH → DOC → cortisol

p450c11B2 → estrone

p450c11B1 → estradiol
Steroidogenesis

Steroidogenesis occurs in the adrenal glands, specifically in the following zones:

- **Glomerulosa**
- **Fasciculata**
- **Reticularis**

The process begins with the conversion of cholesterol to pregnenolone, which is then converted to progesterone by the enzyme **3β-HSD**. Progesterone is further converted to 17α-hydroxyprogrenolone by the enzyme **17α-20-lyase** and then to androstenedione. Androstenedione is converted to testosterone by **3β-HSD**. Testosterone is then converted to estradiol by the enzyme **17α-HSD** and to estrone by **p450Aro**.

The image also shows a histological section of the adrenal gland, highlighting the different zones.
SEVERE P45c21 Deficiency in FEMALE

results in androgen excess in utero

MILD P45c21 Deficiency in FEMALE results in androgen excess at puberty

Cliteromegaly

Hirsuitism
Congenital Adrenal Hyperplasia

Important things to remember:

• Loss of function of enzyme in steroidogenesis pathway

• “Block” in pathway leads to shunting down alternate paths and abnormal build-up precursors before the block.

• Severe forms lead to virulization of females

• Milder forms (“non-classical”) may lead to hirsuitism and menstrual abnormalities in women.

• Block in pathway may result in adrenal insufficiency during times of stress.
Causes of hypercortisolism

- **Physiological states**
  - Pregnancy
  - Stress
  - Chronic excessive exercise
  - Malnutrition

- **Pathologic states**
  - Cushing’s syndrome
  - Diabetes mellitus
  - Hyperthyroidism
  - Severe chronic disease
  - Glucocorticoid resistance
  - Psychological states
  - Anorexia nervosa
  - Panic disorder
  - Melancholic depression
  - Obsessive-compulsive disorder

- **PHARMACOLOGIC USE OF GLUCOCORTICOIDS**
Cushing’s Syndrome

Harvey Cushing (far left) in 1895 during his House Pupilship (internship) at Massachusetts General Hospital.

Cushing HW. The basophil adenomas of the pituitary body and their clinical manifestations (pituitary basophilism). Bulletin of the Johns Hopkins Hospital. 1932;50:137-95

His research on the pituitary body gained him an international reputation, and he was the first to ascribe to pituitary malfunction a type of obesity of the face and trunk now known as Cushing's disease, or Cushing's syndrome.
All types of Cushing’s Syndrome
- HI CORTISOL (urine and serum)
- Absent circadian rhythm

Adrenal Cushing’s syndrome is autonomous and therefore has LOW ACTH
Only ACTH-dependent Cushing’s (by definition) has HI ACTH
Cushing’s Syndrome

ACTH independent Cushing’s
- hypothalamic CRH
- pituitary ACTH
+ adrenal cortisol

ACTH dependent Cushing’s
- pituitary ACTH defect

ectopic ACTH Cushing’s
ectopic CRH Cushing’s
ectopic CRH

## ACTH dependent ONLY

- Pigmentation (MSH)

## ACTH dependent or Mixed Adrenal

- Androgen excess
  - Terminal hair hirsuitism
  - Acne
  - Irregular menses
  - Balding
Cushing’s Syndrome

- Physical examination:
  - adiposity
  - moon face, plethora
  - (pseudo-) gynecomastia
  - striae
Cushing’s Syndrome

- Acanthosis nigricans
- Purple striae
Cushing’s Syndrome

- Myopathy
  - Proximal muscle wasting
- Osteoporosis
- Oligo-Amenorrhea/Impotence
- Psychiatric Symptoms
  - depression, mania (Steroid psychoses)
ACTH-Dependent Pituitary Cushing‘s Disease

- Symptoms due to pituitary mass
  - bitemporal hemianopsia
  - pituitary insufficiency
  - HA
Cushing’s Syndrome: Diagnosis

- **Diagnosis**
  - **First diagnose CORTISOL EXCESS**
    - Elevated 24 hr urine cortisol < 100 mg/24 hr
  - **Then diagnose PATHOLOGIC CORTISOL EXCESS**
    - r/o physiologic causes which suppress normally with low-dose DEX (Cort < 5 mg/dl)

- **ACTH dependent or NOT**
  - Measure ACTH level
    - if DETECTABLE > 9 pg/ml - must be ACTH dependent
    - (if NOT DETECTABLE < 9 pg/ml - must be ACTH independent)
Cushing’s Syndrome: Low-dose DEX suppression

Low-dose Dex will suppress ACTH secretion in:
- normal patients
- physiologic hypercortisolism (stress)

Low-dose Dex will NOT suppress ACTH secretion in:
- ACTH dependent Cushing’s syndrome (pituitary adenoma or ectopic ACTH producing tumors)
- ACTH independent Cushing’s syndrome (adrenal tumors)
Cushing’s Syndrome: Diagnosis

- **Diagnosis**
  - First diagnose CORTISOL EXCESS
    - elevated 24 hr urine cortisol < 100 mg/24 hr
  - Then diagnose PATHOLOGIC CORTISOL EXCESS
    - r/o physiologic causes which suppress normally with low-dose DEX (Cort < 5 mg/dl)

- **ACTH dependent or NOT**
  - Measure ACTH level
    - if DETECTABLE > 9 pg/ml - must be ACTH dependent
    - (if NOT DETECTABLE < 9 pg/ml - must be ACTH independent)
ACTH-DEPENDENT Cushing’s Syndrome

Is it pituitary or ectopic????

- High dose DEX SUPPRESSION TEST
  - Pituitary Cushing’s may suppress to high dose DEX
  - Ectopic NEVER suppresses to high dose DEX

- Inferior Petrosal sinus Sampling
  - Pituitary Cushing’s - find HI ACTH near pituitary and low in the periphery
  - Ectopic Cushing’s - find HI ACTH in the periphery and low near pituitary

- IMAGE the pituitary
Cushing’s Syndrome: High-dose DEX suppression

Most pituitary adenomas that secrete ACTH can still be inhibited by REALLY REALLY HIGH glucocorticoids (i.e., those that produce their diseased HPA axis).

Therefore, high-dose dexamethasone will NOT suppress ACTH from ectopic tumors.

High-dose Dex will suppress ACTH secretion in:
- ACTH dependent Cushing’s syndrome (pituitary adenoma)

High-dose Dex will NOT suppress ACTH secretion in:
- ACTH dependent Cushing’s syndrome (ectopic tumors)
Cushing’s Syndrome: Diagnosis

Most ectopic ACTH-producing tumors secrete ACTH independently from regulation by glucocorticoids.

Therefore, HIGH-dose dexamethasone will NOT suppress ACTH from ectopic tumors.

High-dose Dex will suppress ACTH secretion in:
- ACTH dependent Cushing’s syndrome (pituitary adenoma)

High-dose Dex will NOT suppress ACTH secretion in:
- ACTH dependent Cushing’s syndrome (ectopic tumors)
Imaging in Cushing Syndrome

- **ADRENAL CT findings**
  - adrenals small = ?
  - one adrenal large and 1 small =?
  - Both adrenals large =?

- **Pit MRI findings**
  - Mass or no mass
    - (some pituitary corticotrope tumors are too small to be seen on MRI)

- **Search for ectopic ACTH or CRH producing tumor**
  - Lung: Bronchial Carcinoid and SCC  50%
  - Thymic Carcinoid (epithelial thymoma)  10%
  - Pancreatic Islet Cell Tumor  10%
  - Pleochromocytoma  10%
  - Abdominal Carcinoids  5%
  - Medullary Thyroid Carcinoma  5%
Cushing’s Syndrome Treatment

- **adrenal adenoma**
  - resection
  - cortisol replacement
  - if not curative
    - XRT
    - bilateral adrenalectomy
    - adrenolytic therapy
      - mitotane
      - ketoconazole

- **pituitary adenoma**
  - transphenoidal resection (TSR)
  - cortisol replacement
  - if not curative
    - XRT
    - bilateral adrenalectomy
    - adrenolytic therapy
      - mitotane
      - ketoconazole

- **Ectopic ACTH or CRH**
  - Find the tumor!!!!!!!!!!!
  - if not curative
    - bilateral adrenalectomy
    - adrenolytic therapy
      - mitotane
      - ketoconazole

Conn JW. Primary aldosteronism, a new clinical syndrome. J Lab Clin Med. 1955;45:3-17
Primary Aldosteronism

- Clinical Presentation
  - Manifestations of HYPOKALEMIA and HTN
    - LOW K
      - neuromuscular
        - paresthesias
        - weakness
        - tetany
    - Renal
      - Polyuria
    - Carbohydrate
      - abnormal GTT
    - HTN usually not malignant
      - early in disease may have HTN with NORMAL K
Causes of Hyperaldosteronism

Definition: syndrome of inappropriate excessive secretion of aldosterone by adrenal gland

An increase in aldosterone ACTION can theoretically result from ANY defect in RAA pathway

-LOW IVV (real or perceived by kidney in renal artery stenosis)
-JGA renin tumor
-ACE polymorphisms
-overproduction of AII by renal tumors
-ADRENAL overproduction of ALDO
-constitutive MR or Na channel
Primary Aldosteronism

**primary hyperaldosteronism (HI ALDO/LOW RENIN)**
- ZG Aldo tumor
  - 70%
- ZG Aldo hyperplasia
  - 30%

**rare/rare/rare**
- Constitutively active MR
  - <1%
- Na/K/H channel
  - <1%
- Licorice
  - <1%

**secondary hyperaldosteronism (HI ALDO/HI RENIN)**
- JGA renin tumor
  - <1%
- Renal artery stenosis
  - <1%

**apparent mineralocorticoid excess (LOW ALDO/LOW RENIN) (downstream of ALDO)**
- ACE polymorphisms
  - <1%
- AII overproduction
  - <1%
- Congenital adrenal hyperplasia
  - (p450c11ß, p450c17)
  - <1%
- ZG Aldo tumor
  - 70%
- ZG Aldo hyperplasia
  - 30%
Primary Aldosteronism

Consider in patients with:

- New HTN
- HTN with LOW K

EVEN THOUGH it only accounts for 0.5% of all HTN

BECAUSE- IF YOU NEVER THINK OF THIS--
---YOU WILL NEVER FIND IT!!!
Primary Aldosteronism

- **Work-Up**
  - R/O other causes of LOW K
    - LOW intake (diet)
  - HI output
    - N/V/D
  - Diuretic use with loops + thiazides

- **24 h Urine ALDO**
  - If LOW- pt does not have PRIMARY ALDO
  - IF HI (>10 ug/day)
    - check RENIN level (suppressed < 1 ng/ml/hr)
      - If RENIN HI ---- JGA renin tumor or RAS
      - If RENIN LOW---- PRIMARY HYPERALDO

- IF NECESSARY (ie AMBIGUOUS) Volume expand to see if can suppress RAA
  - If can suppress -- essential HTN
Adrenal Zona Glomerulosa Adenoma

Image of Adrenal gland removed
Primary Aldosteronism

- **IMAGING and TREATMENT**
  - CT scan
    - Adenoma
      - unilateral ADX
    - NO adenoma
      - selective venous cath to measure ALDO rt vs lt
        - If unilateral elevation-small adenoma
        - If no lateralization-bilateral hyperplasia
      - Medical trt with spironolactone or amiloride
    - bilateral ADX
Adrenocortical Carcinoma

- Larger adrenal mass
  - High probability NOT benign if >5 cm in diameter
  - Development of Cushingoid features usually very rapid (several months rather than years)
  - Often associated with elevated DHEA-sulfate and virulization

Image of Adrenal gland removed
Endocrine disorders are NOT diagnosed by means of imagining studies. Biochemical confirmation must come first before imagining is performed.
“Even our destiny is determined by our endocrine glands.”

Albert Einstein
