Abnormalities of Growth & Development

Ram K. Menon, M.D.
Division of Endocrinology
Department of Pediatrics
CS Mott Children’s Hospital
University of Michigan
To understand the
determinants of normal growth
common variations in normal growth
diagnostic approach to a child with abnormal growth
principles of management of a child with abnormal growth
Topics **NOT** covered in today's discussion

- Sexual differentiation
- Ambiguous genitalia and disorders of sexual differentiation
- Pubertal development
- Disorders of pubertal development – delayed / precocious
- Physiology of hormone secretion / action

**OBJECTIVES**
Normal growth is the aggregate of hormonal, environmental, nutritional, and genetic factors

Hormonal Factors

- **Thyroid** - essential for normal growth
  - hypothyroidism is a common cause of severe growth delay
- **Sex steroids** - bone maturation is dependent on estrogen
  - testosterone can enhance GH secretion
- **Glucocorticoids** - potent inhibitor of growth
GH/IGF-1 Axis

Image of GH/IGF-1 Axis removed

Normal Growth

- Weight
- Measurement of height – Stadiometer
  - less than 2 yrs of age – length (supine)
  - greater than 2 yrs of age – height (erect)
- Head circumference
- Span
- Upper segment / lower segment ratio
Normal Growth

Upper / Lower Segment Ratio

Lower segment: symphysis pubis to floor
Upper segment: Ht (-) lower segment

Anthropometric parameters

Normal Growth

Growth Velocity

- measured in cms/yr
- should be measured over at least a 6-12 month period
- more the # of height points used to calculate GV - more reliable is the interpretation
- assessment of pubertal status is critical for interpretation of GV
- Normal GV - is a strong argument AGAINST a significant hormonal abnormality
Girls 2-18 yrs

Source: JM Tanner, et al.
Boys 2-18 yrs

Growth rate (cms/yr)

Age (yrs)

Source: JM Tanner, et al.
Normal Growth

- Chronological age
- Dental age
- Bone Age (skeletal maturation)
  - beyond the neonatal age - X-ray of L wrist
  - comparison with published standards (Greulich & Pyle)

Usefulness
  - prediction of final height
  - age of onset of puberty closely linked to bone age
  - corroborates diagnosis, but is never diagnostic

Caveats - imprecise / ethnic variability
SHORT STATURE

Definition
Classification
Etiology
Evaluation / Diagnostic Approach
Treatment
Short Stature
height < 3rd percentile

Growth Retardation
growth velocity < 3rd percentile
SHORT STATURE Definitions

Short Stature
height < 3rd percentile

Growth Retardation
growth velocity < 3rd percentile

Etiology

Normal Variant

Pathological
**SHORT STATURE**

**Normal Variant**

**Familial / Genetic**
- final ht appropriate for parental ht
- normal size at birth
- GV may be ↓ in 0-3 yrs of age
- BA = CA

**Constitutional Delay of Growth & Puberty**
- "Late Bloomer"
  - family history
  - normal size at birth
  - normal GV
  - delayed puberty
  - BA < CA

---

BA = bone age
CA = chronological age
14 yr old boy
h/o “shortest in his class”
h/o “always a small boy”
h/o father did not “grow” till he entered college

Prepubertal
GV = 5.0 cm/yr
Normal BUN / ESR
Normal Free T4 & TSH
Low-normal IGF-1
Normal IGFBP3 (for Tanner stage)
Bone age = 11.5 yrs

MRI
Normal

Testosterone 50 mg / q 4wks x 3 doses

Source: Undetermined
**SHORT STATURE**

- **Definitions**
  - Short Stature
    - height < 3rd percentile
  - Growth Retardation
    - growth velocity < 3rd percentile

**Etiology**

- Normal Variant
- Pathological
  - Proportionate
  - Disproportionate
Hypothyroidism
GH deficiency
Cushing's syndrome
Malabsorption
Inflammatory bowel disease
Celiac disease
Chronic renal failure
Renal tubular acidosis
Cardiac
Pulmonary
Liver
Infection
Psychosocial Dwarfism
Emotional Deprivation Syndrome
Pathological Proportionate
SHORT STATURE
4 yr old boy
Voracious appetite / drinks urine - toilet bowl
Withdrawn / flat affect
No dysmorphic features
Chaotic home situation - abusive father

Ht age = 1 yr old

All lab tests normal
4 yr old boy  
No dysmorphic features  
Chaotic home situation - abusive father  
Admitted to hospital for observation  
Emotional deprivation syndrome  
Psychosocial dwarfism

Source: Undetermined
6 yr old girl

GV = 3.0 cm/yr

No dysmorphic features

Chaotic home situation - parent incarcerated - shuttled through couple of foster homes

Adopted by a family

Stable home environment

All lab tests normal

Emotional deprivation syndrome

Psychosocial dwarfism

Source: Undetermined
Skeletal Abnormalities
- Dysplasia
- Achondroplasia
- Rickets
- Vertebral anomalies

Dysmorphic Syndromes
- Turner
- Down
- Russell-Silver
- Prader-Willi
- Pseudo-hypoparathyroidism

Pathological Disproportionate

SHORT STATURE

First sign of puberty on PE:
♀ breast dev / ♂ incr in testicular volume

Anthropometric
ht, wt, head circ., arm span, U/L ratio

Nutritional state

Tanner Staging for Pubertal Development

Dysmorphic Features

Neurological exam

Thyroid Gland

Evaluation
Physical Exam
Target Height (in cms)

girl = \frac{[father’s ht + mother’s ht] - 13}{2}

boy = \frac{[father’s ht + mother’s ht] + 13}{2}

normal range is ± 8 cms
Key Parameter - Growth Velocity

**Normal GV**
- Familial
- Constitutional

**Impaired GV**
- Malnutrition
- Chronic systemic illness
- IUGR
- Psychosocial
- Chromosomal abnormalities
- Endocrine
- Malabsorption
- Bone dysplasias
SHORT STATURE

Screening Tests

CBC, ESR, BUN
FT₄, TSH
IGF-1, IGFBP3
Tissue Transglutaminase ab

KARYOTYPE
◊ in girls to exclude TURNER
◊ dysmorphic features

RADIOLOGICAL
◊ bone age
◊ skeletal survey
SHORT STATURE

Growth Hormone Deficiency (GHD)
GH Deficiency (GHD) Signs & Symptoms

- Neonatal - normal size / hypoglycemia / jaundice / micropenis / midline defect
- Decreased growth velocity
- Delayed dentition / mid-facial hypoplasia
- Increase in adiposity
**SHORT STATURE**

**GH Deficiency (GHD) Causes**

- Tumor - craniopharyngioma
- Trauma - surgery / irradiation
- Idiopathic
- Congenital Aplasia / Hypoplasia / Septic-optic dysplasia
- Genetic Defects -
  - Isolated Growth Hormone Deficiency (IGHD)
  - PROP1 / POU1F1 (Pit1)
Criteria for diagnosing GH deficiency

Clinical (NOT laboratory) diagnosis
- GV < 2 SD
- Low IGF-1 & IGFBP-3
- Provocative GH Level < 7-10 ng/ml

Corroborative evidence
- Delayed BA
- Related pathology
Spontaneous pulsatility of GH precludes random measurement.

Provocative test after overnight fast:
- Insulin induced hypoglycemia is the “Gold standard”

**IGF-1 / IGFBP3**

- Altered by nutritional status
- Normal range related to age & pubertal status
Indications for GH Therapy:
- Growth hormone deficiency
- Turner syndrome
- Renal disease, before transplant
- Small for gestational age
- Prader-Willi syndrome
- Idiopathic short stature
SHORT STATURE

Treatment
GH Replacement Therapy

s/c injection
7 days/wk

Side Effects
- Secondary/tertiary hypothyroidism
- Worsening of scoliosis
- Slipped capital femoral epiphysis
- Pseudotumor cerebri

Monitor
GV, Free T4, IGF-1, IGFBP3
8½ yr old girl
h/o poor growth x 12-18 months
recent h/o vague headaches
school performance has recently deteriorated
recent episodes of enuresis

Prepubertal
GV = 1.5 cm/yr
Low Free T₄, Normal TSH
Low IGF-1 & IGFBP3
Karyotype = 46 XX
Bone age = 6 yrs

MRI
craniopharyngioma

Source: Undetermined
8½ yr old girl
h/o poor growth x 12-18 months
h/o vague abdominal discomfort

Prepubertal
GV = 2.5 cm/yr
Normal Free T₄ & TSH
Low IGF-1
Normal IGFBP3
Karyotype = 46 XX
Bone age = 7.5 yrs

Decreased serum albumin, microcytic anemia
ESR - 30

Tissue transglutaminase antibodies +ve
Small Intestine Biopsy - CELIAC DISEASE

Source: Undetermined
5 yr old girl

$GV = 3.0 \text{ cm/yr}$

Subtle dysmorphic features - clinodactyly, webbing of neck ±, t carrying angle

$GV = 3.0 \text{ cm/yr}$

Normal Free T$_4$ & TSH

Normal IGF-1

Normal IGFBP3

Bone age = 5.0 yrs

Karyotype = 45,X

TURNER SYNDROME

Source: Undetermined
Turner Syndrome

BY: Johannes Nielsen, et al.
Turner Syndrome

- Described in 1938 by Dr. Henry Turner
- Most common sex chromosomal abnormality in females -- X chromosome
- Frequency 1:1500 to 1:2500 in live born infant girls
- 15% of spontaneous abortions = TS
Turner Syndrome

Karyotype 45, X

Image of Turner Syndrome Karyotype removed
Turner Syndrome

Clinical Features - Postnatal

- Growth Failure 80-100%
- Gonadal Dysgenesis 80-100%
- Inverted/ widespaced nipples 60%
- Nail dysplasia 60-80%
- High narrow palate 60-80%
- Cardiac malformation 40-60%
- Renal dysplasia 40-60%
- Low hairline/webbing 30-40%
- Pigmented nevi common
Lymphedema at birth is highly correlated with 45,X karyotype and congenital heart abn
Growth velocity (and NOT height) is the key anthropometric parameter.

Normal growth velocity virtually excludes a pathological cause for short stature.

Always exclude Turner’s synd in a girl with short stature.

Diagnosis of a child with growth problems is made more on CLINICAL and less on laboratory criteria.
