M1 - Cardiovascular / Respiratory, Fall 2007

Abrams, G.; Sisson, T.; Jacobson, P.
Ventilation/Perfusion Matching

Thomas H. Sisson, M.D.
Objectives

• To recognize the importance of matching ventilation and perfusion
  – To explain the consequences of mismatched ventilation and perfusion
  – To define shunt and dead space physiology
  – To be able to determine the alveolar $pO_2$
  – To be able to determine the A-a $O_2$ gradient and understand the implications of an increased gradient
  – To explain and understand the consequences of regional differences in ventilation and perfusion due to effects of gravity
Ventilation and Perfusion at the Level of the Whole Lung

- Tidal Volume: 500 mL
- Anatomic Dead Space: 150 mL
- Alveolar Gas Volume: 3000 mL
- Volume of Blood in Pulmonary Capillaries: 70 mL
- Respiratory Rate: 15/min
- Total Ventilation: 7500 mL/min
- Alveolar Ventilation: 5250 mL/min
- Ventilation/Perfusion: $\frac{V}{Q} = 1$
- Pulmonary Blood Flow: 5000 mL/min

Gas Composition in the Alveolar Space

Trachea: partial pressure of CO2 is approximately 0

\[
\text{PiO}_2 = (\text{barometric pressure} - \text{H2O vapor pressure}) \times \text{FiO}_2
\]

\[
= (760 - 47) \times 0.21 = 150 \text{ mmHg}
\]

In the alveolar space, oxygen diffuses into the blood and CO2 diffuses into the alveolus from the blood.
Alveolar Gas Equation

\[ \text{PAO}_2 = (\text{PiO}_2) - (\text{PaCO}_2/R). \]

\( \text{PaCO}_2 \) approximates \( \text{PACO}_2 \) due to the rapid diffusion of \( \text{CO}_2 \).

\( R = \text{Respiratory Quotient (VCO2/V02)} = 0.8 \)

In a normal individual breathing room air:

\[ \text{PAO}_2 = 150 - 40/0.8 = 100 \text{ mmHg} \]
Gas Composition in the Normal Alveolar Space

Trachea: partial pressure of CO2 is approximately 0

\[ \text{PiO}2 = (\text{barometric pressure} - \text{H2O vapor pressure}) \times \text{FiO2} = (760 - 47) \times 0.21 = 150 \text{ mmHg} \]

In the alveolar space, oxygen diffuses into the blood and CO2 diffuses into the alveolus from the blood.
Consequences of Inadequate Ventilation

- **Apnea:**
  - $P_{ACO2}$ rises
  - $PAO2$ falls until there is no gradient for diffusion into the blood

- **Hypoventilation:**
  - Inadequate ventilation for perfusion
  - $PACO2$ rises
  - $PAO2$ falls, but diffusion continues
How Can We Tell if Alveolar Ventilation is Adequate?
PaCO₂ and Alveolar Ventilation

• PaCO₂ is:
  – directly related to CO₂ production (tissue metabolism).
  – Inversely related to alveolar ventilation.

• Increased PaCO₂ (hypercarbia) is always a reflection of inadequate alveolar ventilation (VA).

\[ PaCO₂ \approx \frac{VCO₂}{VA} \]
Alveolar Hypoventilation

Suppose a patient hypoventilates, so that the PCO2 rises to 80 mmHg. We can estimate the PAO2 based on the alveolar gas equation.

\[ PAO2 = 150 - \frac{80}{0.8} = 50 \text{ mmHg} \]

Thus even with perfectly efficient lungs, the PaO2 would be 50, and the patient would be severely hypoxemic. Therefore, hypoventilation results in hypoxemia.
V/Q Matching

• 300 million alveoli.

• Different alveoli may have widely differing amounts of ventilation and of perfusion.

• Key for normal gas exchange is to have matching of ventilation and perfusion for each alveolar unit
  – Alveoli with increased perfusion also have increased ventilation
  – Alveoli with decreased perfusion also have decreased ventilation
  – V/Q ratio = 1.0
Two Lungs, Not One

• Suppose the left lung is ventilated but not perfused (dead space).

• Suppose the right lung is perfused but not ventilated (shunt).

• Total V/Q = 1, but there is no gas exchange (V/Q must be matched at level of alveolar unit).
Low V/Q Effect on Oxygenation

One lung unit has normal ventilation and perfusion, while the has inadequate ventilation.

PO2 ?

↑ PCO2

↓ PO2
Mixing Blood

- What is the PO2 of a mixture of two volumes of blood with different initial PO2?
- Determined by interaction of oxygen with hemoglobin.
  - the partition of oxygen between plasma (and thus the pO2) and bound to hemoglobin is determined by the oxyhemoglobin dissociation curve.
Oxyhemoglobin Dissociation Curve

\[ \text{CO}_2 = (1.3 \times \text{HGB} \times \text{Sat}) + (0.003 \times \text{P}_0^2) \]

- % Hemoglobin Saturation
- Oxygen Combined With Hemoglobin
- Dissolved Oxygen
- Oxygen Content (ml/100 ml)
- P\textsubscript{O}_2 mmHg
- Oxyhemoglobin
- Dissociation Curve
Low V/Q Effect on Oxygenation

One lung unit has normal ventilation and perfusion, while the other has inadequate ventilation.

- Normal: PO2 114
- Low V/Q: PO2 50

Low V/Q Effect on Oxygenation

One lung unit has normal ventilation and perfusion, while the other has inadequate ventilation.

- **Normal**
  - PO2 114 mmHg
  - O2sat 100%
  - O2 content 20ml/dl

- **Low V/Q**
  - PO2 50 mmHg
  - O2sat 80%
  - O2 content 16ml/dl

- **PO2 50**
  - PO2 60 mmHg
PCO2 in V/Q Mismatch

- Increased ventilation can compensate for low V/Q units.
  - Shape of CO2 curve
- Total ventilation (VE) must increase for this compensation.
Extremes of V/Q Inequality

• Shunt
  – Perfusion of lung units without ventilation
    • Unoxygenated blood enters the systemic circulation
    • $V/Q = 0$

• Dead space
  – Ventilation of lung units without perfusion
    • Gas enters and leaves lung units without contacting blood
    • Wasted ventilation
    • $V/Q$ is infinite
Effect of Changing V/Q Ratio on Alveolar PO2 and PCO2

One lung unit has normal ventilation and perfusion, while the other has no ventilation.
Response to Breathing 100% Oxygen

- Alveolar hypoventilation or V/Q mismatch responds to 100% oxygen breathing.
- Nitrogen will be washed out of low ventilation lung units over time.
- PaO2 will rise to > 550 mmHg.
- Limited response to oxygen in shunt.
- Use this characteristic to diagnose shunt.
Shunt Calculation

- \( Qt \times CaO2 = \text{total volume of oxygen per time entering systemic arteries} \)
  - \( Qt = \text{total perfusion} \)
  - \( Qs = \text{shunt perfusion} \)
  - \( CaO2, Cc'O2, CvO2 \) are oxygen contents of arterial, capillary and venous blood

- \( (Qt-Qs) \times Cc'O2 = \text{oxygen coming from normally functioning lung units} \)

- \( Qs \times CvO2 = \text{oxygen coming from shunt blood flow} \)
Shunt

\[ \dot{Q}_t \quad C_{\overline{v}O_2} \quad \dot{Q}_s \quad C_{c'O_2} \quad \dot{Q}_t \quad C_{ao_2} \]
Shunt Equation

\[ Qt \times CaO2 = [(Qt - Qs) \times CcO2] + [Qs \times CvO2] \]

\[
\frac{Qs}{Qt} = \frac{Cc'O2 - CaO2}{Cc'O2 - CvO2}
\]
Causes of Shunt

• Physiologic shunts:
  – Bronchial veins, pleural veins

• Pathologic shunts:
  – Intracardiac
  – Intrapulmonary
    • Vascular malformations
    • Unventilated or collapsed alveoli
Detecting V/Q Mismatching and Shunt

• Radiotracer assessments of regional ventilation and perfusion.

• Multiple inert gas elimination.
  – Takes advantage of the fact that rate of elimination of a gas at any given V/Q ratio varies with its solubility.

• A-aO2 Gradient.
V/Q Relationships

Multiple Inert Gas Elimination

A-a O2 gradient

- In a totally efficient lung unit with matched V/Q, alveolar and capillary PO2 would be equal.

- Admixture of venous blood (or of blood from low V/Q lung units) will decrease the arterial PaO2, without effecting alveolar O2 (PAO2).

- Calculate the PAO2 using the alveolar gas equation, then subtract the arterial PaO2: \((\Pi O_2) – (PaCO_2/R)\) – PaO2.

- The A-a O2 gradient (or difference) is < 10-15 mmHg in normal subjects
  - Why is it not 0?
Apical and Basilar Alveoli in the Upright Posture

- Elastic recoil of the individual alveoli is similar throughout the normal lung.
- At end expiration (FRC) apical alveoli see more negative pressure and are larger than basilar alveoli.
- During inspiration, basilar alveoli undergo larger volume increase than apical alveoli.
- Thus at rest there is more ventilation at the base than the apex.
- Also More Perfusion to Lung Bases Due to Gravity.
Effects of Gravity on Ventilation and Perfusion

Effects of Gravity on Ventilation and Perfusion Matching

BY: University of Michigan Medical School

Causes of Abnormal Oxygenation

- Hypoventilation
- V/Q mismatch
- Shunt
- Diffusion block
Ventilation and Perfusion must be matched at the alveolar capillary level.

V/Q ratios close to 1.0 result in alveolar PO2 close to 100 mmHg and PCO2 close to 40 mmHg.

V/Q greater than 1.0 increase PO2 and Decrease PCO2. V/Q less than 1.0 decrease PO2 and Increase PCO2.

Shunt and Dead Space are Extremes of V/Q mismatching.

A-a Gradient of 10-15 Results from gravitational effects on V/Q and Physiologic Shunt.
