ABSTRACT

The procedures employed to review and refine the DOVAP tracking data presented in Technical Report 2387-50-T are described. The final trajectory results are listed in four appendices to the report. New results, not listed in Report 2387-50-T, are tabulations and graphs of velocity and acceleration data, peak altitudes, and a comparison of ballistic camera and DOVAP data. The random and systematic errors of the data are estimated.

I. INTRODUCTION

Ten Aerobee rockets carrying the Signal Corps—University of Michigan grenade experiment for upper-air temperature and winds were fired at Fort Churchill, Canada, as part of the U.S. IGY rocket program. Grenades carried aloft by each missile were ejected and exploded along the upleg portion of the rocket path. The DOVAP tracking system data for each flight were reduced by The University of Michigan project personnel as reported in Report 2387-50-T,¹ entitled DOVAP Data Reduction for IGY Grenade Aerobee Rockets SM 1.01—SM 2.10. Section IX of that report recommends continuation of the data reduction for the ten flights and makes three suggestions for further study:

1. The data for SM 1.01, SM 1.02, SM 1.03, and SM 1.05 should be refined and DOVAP, ballistic camera, and radar data for these four flights should be compared.
2. The data reduction for SM 2.10 should be carried out up to the peak of the rocket trajectory.
3. Velocity and acceleration data should be calculated for all ten flights.

These suggestions have largely been carried out; in addition, the data for the remaining six rockets have been refined, and some additional trajectory data have been calculated. This supplement describes the review and refinement of the data. The final trajectory results are listed in the appendices.

II. DOVAP DATA REVIEW AND REFINEMENT

The DOVAP data for SM 1.01, SM 1.02, SM 1.03, and SM 1.05 were reviewed as recommended. The review of SM 1.02 cycle counts showed that, as a result of the smoothing of second differences, the total cycle count for each channel had been modified by a large fraction of a cycle. A review of the other six sets of data was also made and showed similar changes in SM 1.04 and SM 1.08. Since a basic rule in editing the data is that the total cycle count should not be modified by smoothing, all modified cycle counts were restored to their original values.

When Report 2387-50-T was written, it was felt that geometry corrections for the first 40 seconds of flight were adequate. However, further study of SM 1.03, SM 1.05, SM 2.06, and SM 1.09 showed that failure to include geometry corrections in the data for the whole trajectory could introduce a systematic error of as much as 0.4 cycle. As a result of this study, geometry corrections were made for the entire trajectory on all flights.

At this point in the review, it became necessary to rewrite the IBM 650 trajectory solution programs for the LGP-30 digital computer because the IBM 650 facility at the University had been discontinued. The programs were checked out and ten DOVAP data tapes were punched, proofread, and corrected. Data were included to take SM 2.10 from 95.0 seconds to peak, to take SM 2.06 from 95.0 seconds to the time of the last grenade explosion, and to extend the four-channel solution for SM 1.02 from 115.5 seconds through the time of the last grenade explosion. A trajectory solution—a position for each combination of three receivers and the average of the four positions—was computed for each flight.

The techniques used to refine the DOVAP data are best illustrated by referring to a set of trajectory results in Report 2387-50-T. Refer to the SIG X column on SM 1.09 and note the regular increase of the values up to 100.5 and 101.0 seconds. The standard deviations of these two points can be increased to fit the trend of the SIG X values by changing the cycle count at 100.5 seconds on one channel by about 0.5 cycle and then changing the count on the same channel by an equal and opposite amount at 101.5 seconds.

Next note that the SIG X curve from 107.5 seconds through 119.5 seconds has been shifted up by several feet, apparently due to an error in the cycle-count data. The data at 107.5 and 108.0 seconds are in the highly disturbed region immediately following a grenade explosion. For this case second differences taken on all channels about these points indicated the magnitude and sign of the equal and opposite corrections necessary to shift the SIG X curve to eliminate the discontinuity noted above.

In the original data reduction, cycle counts taken from very noisy re-

gions on the film were of questionable accuracy. Trajectory calculations using the questionable counts occasionally show standard deviations which depart sharply from the trend of the SIG X curve. These counts are changed to smooth the trajectory results.

If additional smoothing of the trajectory results is desired, equal and opposite adjustments of the cycle counts should be made by adhering strictly to the following rules: (1) the adjustments should be kept as small as possible, (2) the sum of the changes must be zero in as small an interval as possible, and (3) the sum of the changes must be zero for the entire channel. The only possible exception to these rules is the case above, in which the change made in a questionable count to smooth the results is not included in the total of smoothing adjustments. Therefore the total change in cycle count for the channel is not zero. This exception to the general rule is felt to be justified because the trajectory results indicate an error in the questionable cycle count.

The data tapes were corrected to include the refinement of counts and another trajectory was run off for each rocket flight. If the results warranted additional smoothing, this was done according to the three rules above. Again the data tape was corrected and another trajectory was run and examined. This process was repeated until a satisfactory set of DOVAP data was obtained; then the final runs were made. The appendices list the results of the final trajectory solutions.

III. RESULTS

A. TRAJECTORY AND GRENADE-EXPLOSION POSITION DATA

The final results of the Fort Churchill DOVAP data reduction are given in Appendices A and B of this supplement. Appendix A gives the position, velocity, and acceleration components with respect to the Aerobee launcher. Appendix B lists the rocket positions above the microphone array at the times of the grenade explosions.

Comparison of the new results with the results previously listed in Report 2387-50-T shows appreciable changes in the position data for SM 1.02, SM 1.04, SM 2.06, SM 1.07, and SM 2.10, especially at high altitudes. The horizontal coordinates are changed by as much as 270 feet. The vertical coordinates are changed by less than 100 feet, except on SM 2.06.

On SM 2.06 the trajectory data in Appendix A are changed appreciably from the data given in the Report 2387-50-T; the vertical coordinate at 95 seconds is now 378 feet lower. However, the grenade position data of Appendix B remain essentially the same. Apparently, the trajectory data for SM 2.06, contained in Appendix A of Report 2387-50-T, were in error.

The data on the other five flights, SM 1.01, SM 1.03, SM 1.05, SM 1.08, and SM 1.09, have not been changed appreciably.

B. LAYERS BETWEEN GRENADE EXPLOSIONS

Note that even though the positions of the grenade explosions are changed in some of the flights, the layers of air between grenade explosions, which are the critical data for the temperature and wind calculations in the grenade experiments, are not changed appreciably.

C. STANDARD DEVIATIONS OF THE DATA

On all flights the standard deviations of the refined data are essentially the same or better than previously reported. The improvement in standard deviation is especially noticeable on SM 1.02, SM 1.04, SM 2.06, SM 1.07, and SM 2.10.

D. THE COMPARISON OF DOVAP DATA WITH BALLISTIC CAMERA DATA

Appendix C contains tables listing the ballistic camera and DOVAP grenade-explosion coordinates with respect to the Aerobee launcher for SM 1.01, SM 1.02,

SM 1.03, and SM 1.05. The tables list in order for each explosion the ballistic camera data, the DOVAP position data obtained with the use of a vacuum wavelength, and the DOVAP position data obtained with the use of an average wavelength.

Graphs of the difference between ballistic camera and average DOVAP data are also given in Appendix C.

From these graphs it can be seen that the systematic errors between these two tracking systems are typically less than 150 feet in the north-south coordinate data (X), less than 180 feet in the east-west coordinate (Y), and less than 125 feet in the vertical coordinate (Z). These values are stated conservatively. Half of the time, the errors between the two systems are less than half the values given above.

These results can be compared with the results given by Brown and Patton² for a flight at White Sands Proving Ground in which the agreement in the north-south coordinate was less than 60 feet, less than 25 feet for the east-west coordinate, and less than 180 feet for the vertical coordinate.

E. ROCKET PERFORMANCE

The peak altitude of each of the Fort Churchill Grenade Aerobees has been calculated using the equation:³

$$r_p = \frac{r_o \lambda \sin^2 \gamma}{1 - \sqrt{1 - (2 - \lambda) \lambda \sin^2 \gamma}} \quad (1)$$

where

$$r_o = h_o + a \quad (\text{km})$$

$$a = 6378 \text{ km}$$

$$\begin{aligned} \sin \gamma &= \frac{V_z}{|\vec{V}|} \\ \lambda &= \frac{|\vec{V}|^2 r_o}{GM} \end{aligned}$$

$$GM = 3.9861 \cdot 10^5 \text{ km}^3/\text{sec}^2$$

and

$$h_o = z, V_z, \text{ and } |\vec{V}| \text{ is an initial point taken from the DOVAP trajectory data.}$$

A calculation was made using Eq. (1) for 10-20 initial points in the neighborhood of 100 seconds on each flight. The average value of peak altitude for each of the flights is given in the table in Appendix D. This table

also gives the components of velocity at burnout.

The evaluation of the rocket performance is aided by the graphs of acceleration versus time and velocity vs. time which are also contained in Appendix D.

The rockets used on SM 2.05 and SM 2.10 were AJ-10-34 "intermediate" Aerobees; on the other eight flights, the AJ-10-25 "standard" Aerobee was used.

Note from the table in Appendix D that for the AJ-10-25 rockets, the burnout velocity and peak altitude were low on SM 1.01, SM 1.04, and SM 1.07. For the AJ-10-34 rockets, the burnout velocity and peak altitude on SM 2.06 were appreciably lower than on SM 2.10.

The low peak altitude on SM 1.01 was primarily due to the heavy payload and excessive drag of the DOVAP antennas, although a few miles were lost from peak because of the rather large horizontal velocity developed.

On SM 1.04 and SM 1.07, the low peak altitude was due to the rather poor performance of the rocket motor. The low burning time on SM 1.04 and the rather long erratic burning time on SM 1.07 are easily seen on the graphs of acceleration vs. time in Appendix D. Again some peak altitude was lost because a rather high horizontal component of velocity was developed.

On SM 2.06 the burning time was slightly low and a rather large horizontal component of velocity was developed; this resulted in a lower peak altitude than obtained on SM 2.10.

IV. ERRORS

The sources of error and the method of analysis are described completely in Report 2387-50-T. The review and refinement of the data since that report was issued have served to establish more firmly the magnitudes of errors given in that report.

The magnitude of random error in DOVAP position data is indicated by the values of the standard deviation given in Appendices A and B. The equivalent standard deviations in cycle count (n) and in the transmitter-rocket-receiver distances (u) can be calculated as described in Report 2387-50-T. The random errors for the final data on the Fort Churchill flights can be summarized as follows:

- (a) For all flights except SM 1.02 and SM 1.09 at high altitudes

$$\begin{array}{ll} \sigma_x < 15 \text{ feet} & \sigma_u < 5 \text{ feet} \\ \sigma_y < 15 \text{ feet} & \sigma_n < 0.4 \text{ cycle} \\ \sigma_z < 4 \text{ feet} & \end{array}$$

- (b) For SM 1.02 and SM 1.09 at high altitudes

$$\begin{array}{ll} \sigma_x < 40 \text{ feet} & \sigma_u < 8 \text{ feet} \\ \sigma_y < 40 \text{ feet} & \sigma_n < 0.7 \text{ cycle} \\ \sigma_z < 6 \text{ feet} & \end{array}$$

The magnitude of the possible systematic errors in the DOVAP position data are indicated by the comparison with ballistic camera position data (see Appendix C and Section III, D). Since the two tracking systems theoretically have comparable accuracy and precision, a comparison of ballistic camera data and DOVAP data on the same flight should indicate the magnitude of the possible systematic errors. The data of Section III, D, show differences and thus possible systematic errors in either system of:

$$\Delta x < 150 \text{ feet}$$

$$\Delta y < 180 \text{ feet}$$

$$\Delta z < 120 \text{ feet}$$

Since both the random errors and systematic errors in the coordinates of the position data increase uniformly with altitude, the errors in the layers

between grenade explosions remain smaller than the errors in the position of each grenade explosion. The error in such a layer corresponds to the random error in cycle count of ± 0.5 cycle as stated in Report 2387-50-T: "The corresponding errors in vertical and horizontal distance between two consecutive grenade explosions are less than ± 6 feet and ± 36 feet, respectively."

V. CONCLUSIONS

The DOVAP data for the ten rocket-grenade Aerobees SM 1.01—SM 2.10 have been reduced to position, velocity, and acceleration data. The initial data reduction has been reviewed and refined.

The position of the rocket antenna system, at the time of each grenade explosion, and the layers between consecutive grenade explosions have been calculated.

The random errors of the DOVAP system were determined and an estimate of the possible systematic error has been made by comparison with ballistic camera data.

It has been determined that the accuracy of the DOVAP system data is sufficient for the grenade experiment for upper-air temperature and winds.

APPENDIX C

A COMPARISON OF BALLISTIC CAMERA DATA ABOVE THE LAUNCHER WITH DOVAP DATA
CALCULATED FIRST WITH THE VACUUM VELOCITY OF LIGHT
AND THEN WITH THE AVERAGE VELOCITY

The rows of data correspond to the above order. The vacuum velocity used was 299792.9 km/sec; the average velocity used was 299748 km/sec. The standard deviations of the ballistic camera data were furnished by BRL.

APPENDIX D

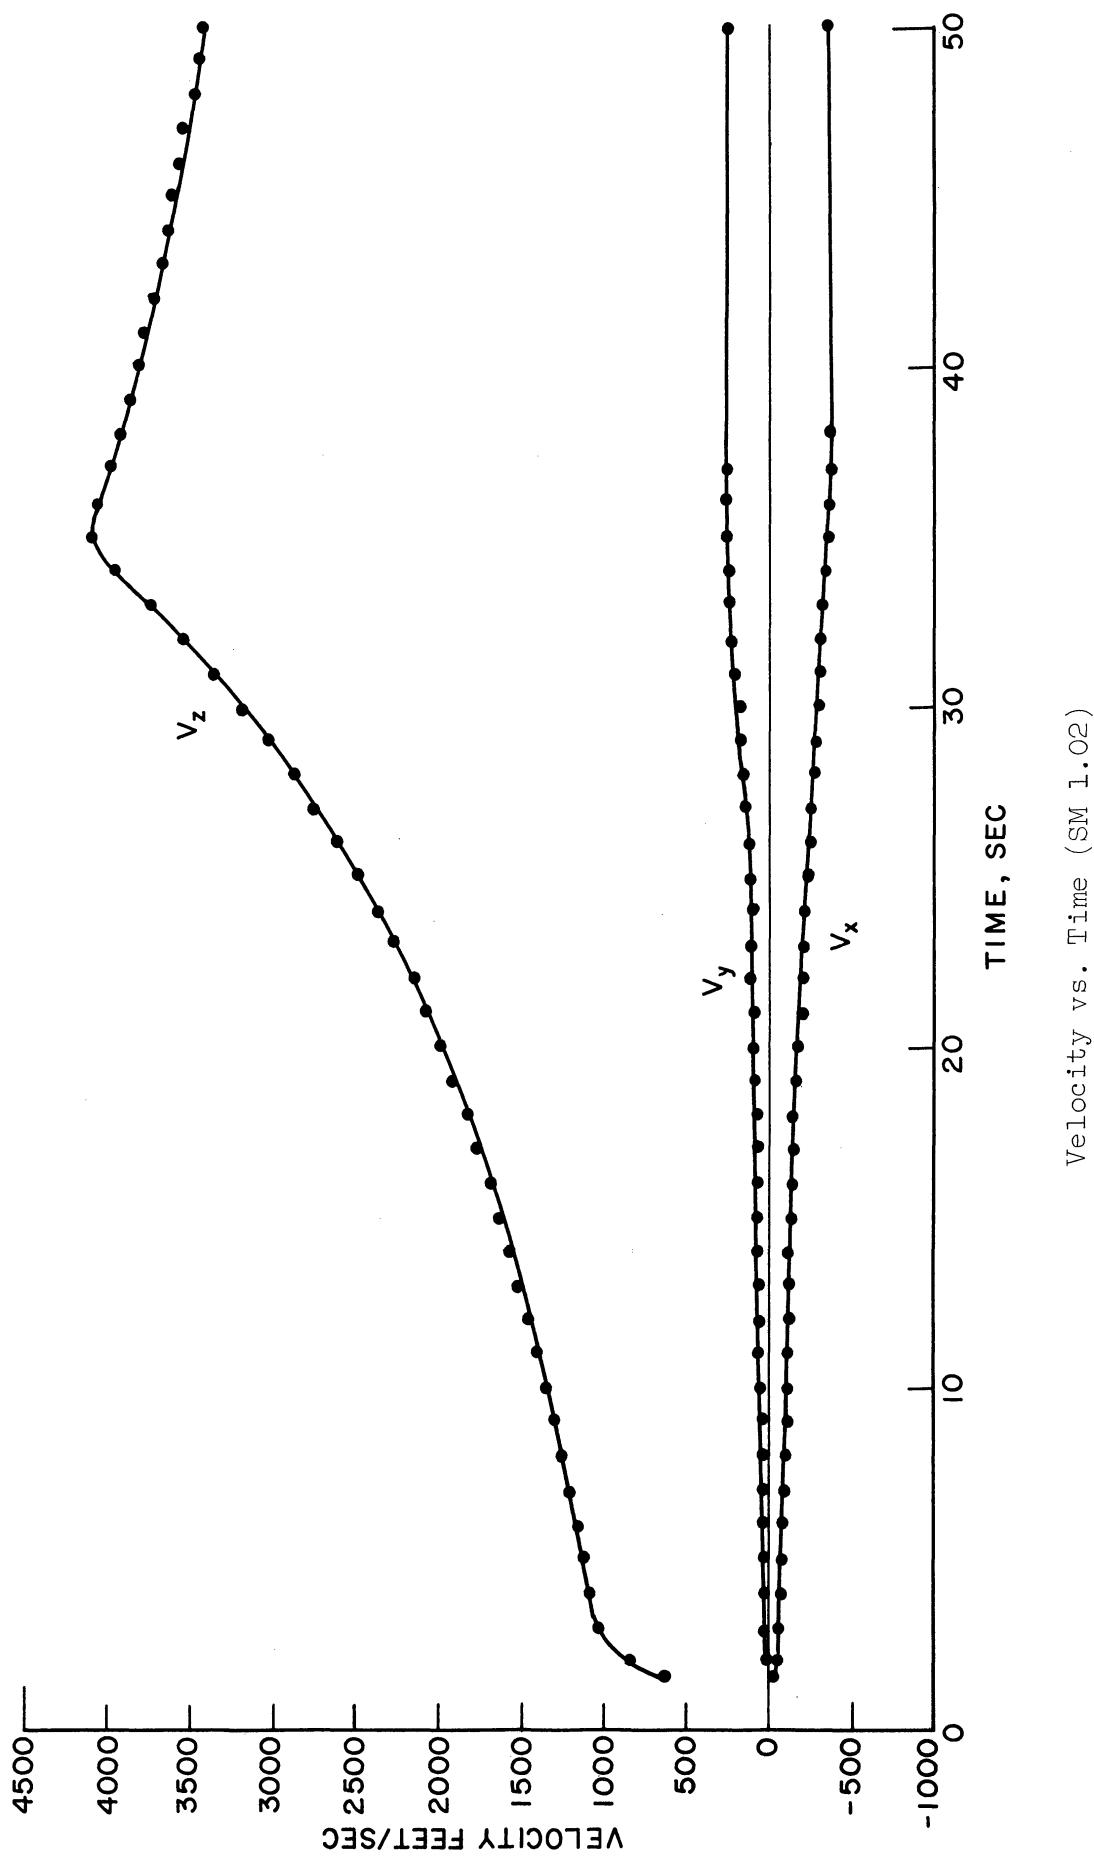

PLOTS OF VELOCITY COMPONENTS THROUGH THE FIRST 50 SECONDS OF FLIGHT AND
PLOTS OF VERTICAL (A_z) AND VECTOR ACCELERATIONS $|\vec{A}|$
THROUGH BURNOUT ARE SHOWN FOR EACH ROCKET

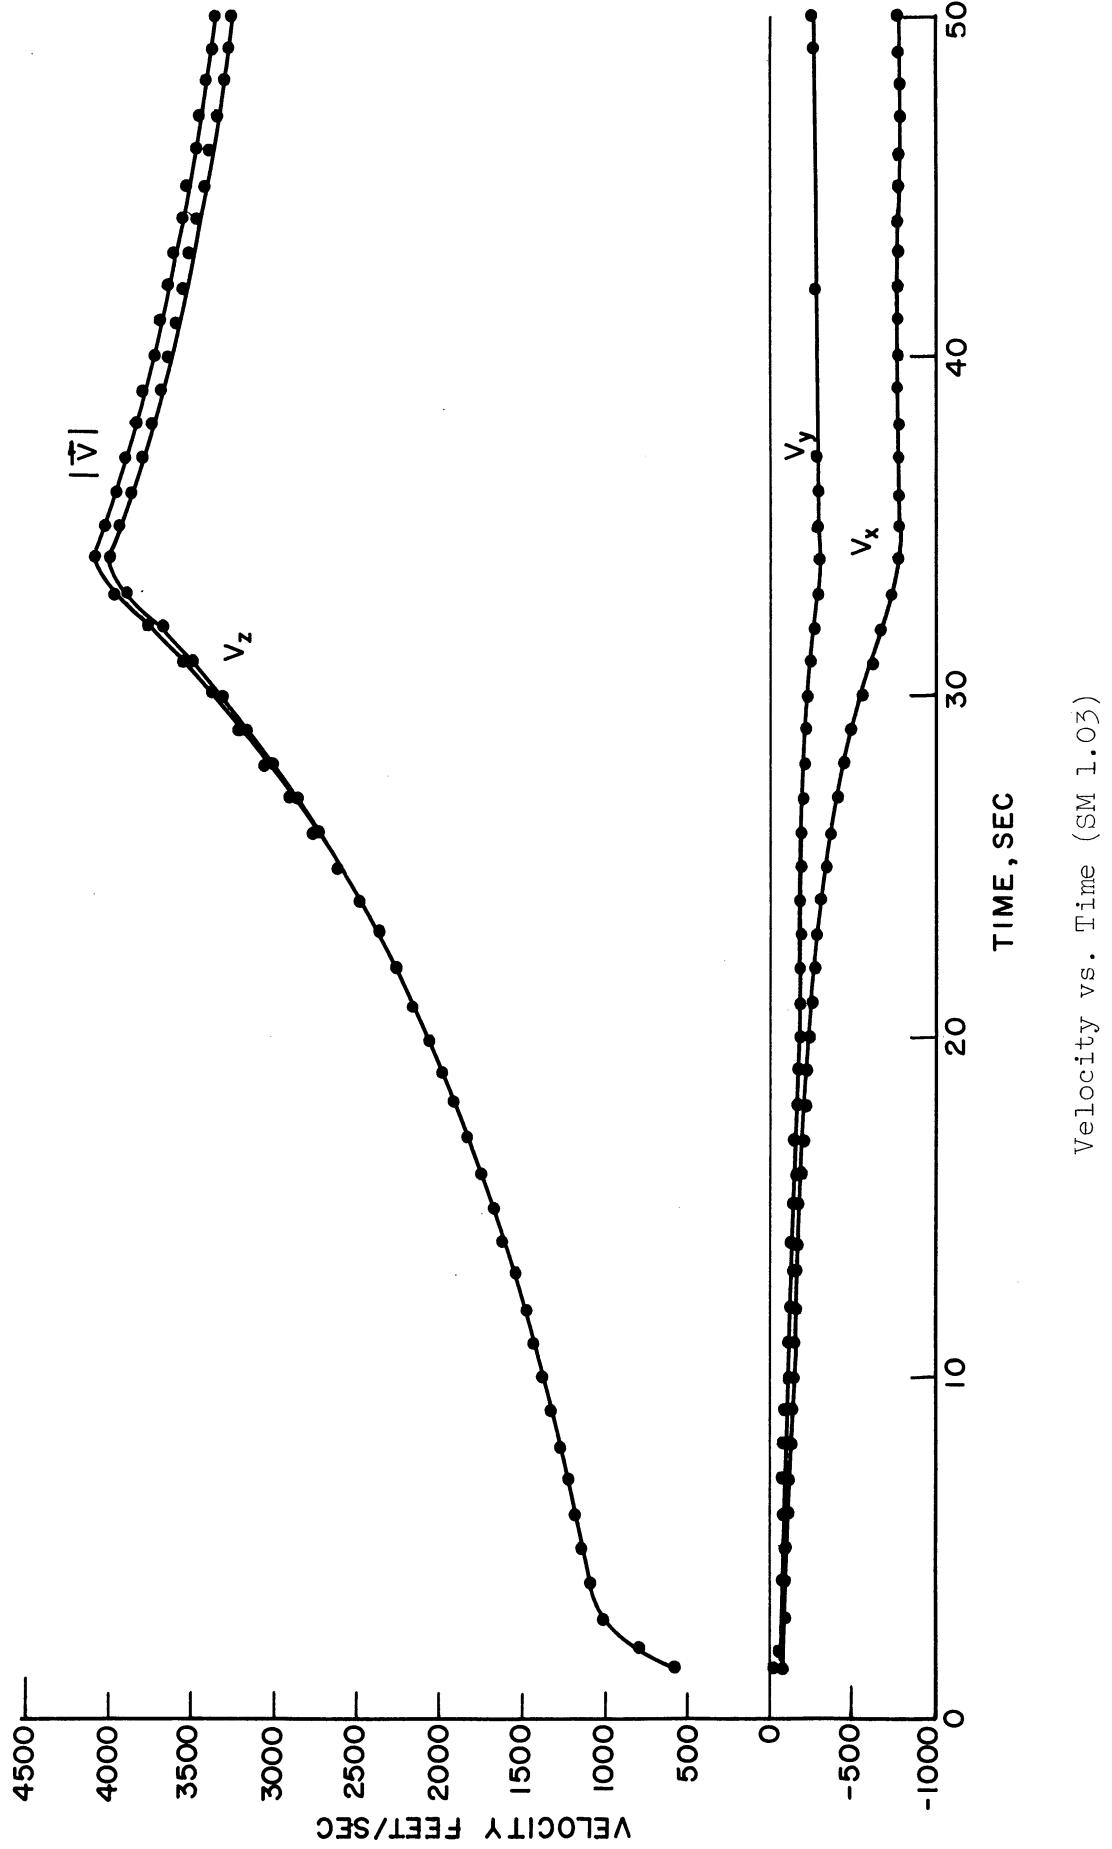

Burnout velocity components and peak
altitudes are listed for each rocket.

ROCKET		BURNOUT	VELOCITY AND PEAK ALTITUDE	V_x (ft/sec)	V_y (ft/sec)	V_z (ft/sec)	V (ft/sec)	PEAK ALTITUDE (ft)
