ABSTRACT

Tables of the integral $\frac{y}{\pi} \int_{-\infty}^{\infty} \frac{\exp(-t^2)}{y^2+(x-t)^2} dt$ for the range $x = 0$ to 240 and $y = 0$ to 23 are presented.

1. INTRODUCTION

The Voigt profile which gives the absorption coefficient for a spectral line with combined Doppler and radiation damping or collisional broadening is of interest to astrophysicists for studies of the profiles of stellar absorption lines and to meteorologists for radiative transfer calculations involving gases at low pressures.

Recently several tables of this function have appeared, Posener,¹ Faddeeva and Terentev,² Fried and Conte,³ and Finn and Mugglestone.⁴ Surtees⁵ has recently noted values may be obtained using tables of the complex Fresnel integral prepared by Martz.⁶ Interesting comments concerning this and related functions are given in the review of Fried and Conte's book in Mathematics of Computation.⁷

The excuse for preparing these tables is that they are more extensive than previous tabulations and have been specifically prepared for the meteorologist performing radiative transfer calculations.

2. DETAILS OF COMPUTATION

The Voigt profile is given by

$$K(x,y) = \frac{k_\nu}{k_0} = \frac{y}{\pi} \int_{-\infty}^{\infty} \frac{\exp(-t^2)}{y^2 + (x-t)^2} dt$$

where k_ν is the absorption coefficient

$$k_0 = \frac{S}{\alpha_D} \left(\frac{\ln 2}{\pi} \right)^{1/2}$$

$$y = \frac{\alpha_L}{\alpha_D} (\ln 2)^{1/2}$$

$$x = \frac{\nu - \nu_0}{\alpha_D} (\ln 2)^{1/2}$$

S = line strength

$\alpha_D = \frac{\nu_0}{c} \left(\frac{2kT \ln 2}{m} \right)^{1/2}$, the Doppler half-width

α_L = radiation damping or collisional broadening half-width

ν_0 = wave number of line center

ν = wave number at which k_ν is to be evaluated

The tables present $K(x,y)$ for the range $x = 0$ to 240 and $y = 0$ to 23. The tables were prepared using the method described by Young.⁸ This method was designed for use as a computer subroutine and is not particularly efficient for table preparation. As a matter of interest, it took an IBM 7090 about 10 minutes to prepare and print the tables.

The calculations were checked against the more recent tabulations, good agreement being obtained. The differences were mostly confined to 1 or 2 in the sixth significant figure. Consequently the tables are considered accurate to five significant figures.

3. USE OF TABLES

The best method for computing $K(x,y)$ for radiative transfer calculations is to use the method described by Young⁸ as a computer subroutine. The tables should prove useful if only a limited number of values are desired. The tabulations are close enough so that interpolation can be easily and accurately performed to give values for non-tabulated x and y .

The maximum value for x is 240 at which point accurate approximations may be employed; these approximations are discussed in the references. If, for example, collisional broadening is being considered then the Lorentz line shape formula may be used.
