A. General Information

All reagents were used as received unless otherwise noted. Solvents were purified under nitrogen using a solvent purification system (Innovative Technology, Inc., Model # SPS-400-3 and PS-400-3). Ni(COD)$_2$ (Strem Chemicals, Inc., used as received) and triphenylphosphine (PPh$_3$) were stored and weighed in an inert atmosphere glovebox. All reactions were conducted in flame-dried glassware under a nitrogen atmosphere. $^1$H and $^{13}$C spectra were obtained in CDCl$_3$ at rt, unless otherwise noted, on a Varian Mercury 400 or Varian Unity 500 MHz instrument. Chemical shifts of $^1$H NMR spectra were recorded in parts per million (ppm) on the $\delta$ scale from an internal standard of residual chloroform (7.27 ppm). Chemical shifts of $^{13}$C NMR spectra were recorded in ppm from the central peak of CDCl$_3$ (77.0 ppm) on the $\delta$ scale. High resolution mass spectra (HRMS) were obtained on a VG-70-250-s spectrometer manufactured by Micromass Corp. (Manchester UK) at the University of Michigan Mass Spectrometry Laboratory.

Compounds 6a$^1$, 6b$^1$, 6c$^1$, 6d$^2$, 6e$^3$, 6f$^4$, 6g$^5$, 6h$^6$ and 6i$^7$ were prepared according to literature procedure. Enone reagents were used as received.

Regioisomeric ratios were determined on crude reaction mixtures using NMR and/or GCMS. GCMS analyses were carried out on an HP6890 Series GC System with a HP-5MS column (30m x 0.252 mm x 0.25µm). The trisubstituted alkene stereochemistry was determined by NOE in the following cases: compound 1a and Table 2, entries 12 and 13.
B. Experimental Procedure and Characterization

General Procedure for the Ni(COD)$_2$/PBu$_3$ Promoted Reductive Coupling of Enones and Alkynes

To a solid mixture of Ni(COD)$_2$ (0.03 mmol) and triphenylphosphine (PPh$_3$) (0.06 mmol) was added toluene (1 mL) at rt. After stirring for 5-10 min at rt, triethylsilane (0.6 mmol) and then enone (0.3 mmol) were added by syringe to the dark red mixture, followed by syringe drive addition of allene (0.45 mmol) in toluene (4 mL) at 1 mL/hr at 50 °C. The reaction mixture was stirred at 50 °C until TLC analysis indicated disappearance of the enone. The reaction mixture was concentrated, and then diluted with ethyl acetate. A solution of tetrabutylammonium fluoride (n-Bu$_4$NF) (0.6 mmol) in THF was added to the reaction mixture and stirred until TLC analysis indicated disappearance of the enol silane product. The reaction mixture was washed with brine, dried over magnesium sulfate, filtered, concentrated, and the residue was purified by column chromatography on silica gel.
