

To the magnificent results of two very intended pregnancies –  
and to the one who made it all possible

## ACKNOWLEDGEMENTS

I would like to thank my Chair, Jane Banaszak-Holl, for her wisdom, encouragement, and patience. My experience as a doctoral student was greatly enhanced by Jane's willingness to take me on as an advisee mid-course. I would also like to recognize the contributions of my other Committee members: Paula Lantz, Tom Reischl, and Jennifer Barber. No one has taught me more about research methods than Kathy Welch. Kathy's guidance through the world of hierarchical linear modeling resulted in a renewed sense of methodological competence, while simultaneously providing a clear and constant reminder to always check with a statistician.

I was also fortunate to be exposed to a number of outstanding mentors in teaching: Tim Johnson, Rich Lichtenstein, Lisa Kane-Low, and Lisa Martin. These educators are strong examples of equal passion for both subject matter and the success of their students. I have been similarly inspired by the enthusiasm and intelligence of so many of my students. My interactions with these young scholars will undoubtedly continue to inspire my career in teaching.

I would also like to thank those who encouraged my career in public health early on. Alma Berson and the late Sol Levine were instrumental in orchestrating my introduction to the field. Working for Peter Jacobson allowed me to envision a future in behavioral health policy. In particular, Leslie Tarr Laurie insured that I was cognizant of issues in women's reproductive health from birth. Leslie's work in providing a range of

high-quality health services and interventions to those in greatest need continues to inspire.

I am deeply grateful to my friends for their unrelenting support. Throughout this process Ann Arbor has become my home and I couldn't create a more ideal neighborhood than the 1600 block of Brooklyn Avenue. I count among many remarkable friends Anne Leo, Jean Song, Lauren Wichterman, Anuja Rajendra, Linda Levy, Ali Reingold, and Melissa Greenhawt. In addition, Colin Smith and my colleagues on the Park Advisory Commission have provided me with an outlet for meaningful engagement with the community. I would be remiss if I also did not thank the many fabulous teachers who have cared so deeply for my children. Without the knowledge that they were in a loving and stimulating environment, I would never have been able to focus on my own endeavors.

My parents, Ellen and Mark Berson, have encouraged my academic career every step of the way. They not only have provided me with profound love and support, but have allowed me to find my own career path. My husband's parents, Myrna and Joe Grand, have been a tremendous source of emotional support, in addition to providing invaluable hours of childcare. I am also grateful for my brothers, Steve and Mike Berson, my sister-in-law Sarah Berson, brother-in-law Jon Grand, and niece Norah Berson. Finally, I continue to be blessed by the presence of three strong women: my grandmother Shirley Gordon, as well as my adopted grandmothers Etta Schiller and Freda Grand.

Most importantly, I want to thank my husband David Grand and our truly amazing children Maddie and Sam. David has been a constant source of love, friendship, and joy in my life. I would never have made it to this point without his support and

patience. This process has taken considerably longer than anticipated, but the reasons behind those breaks are infinitely more important than any credential or piece of paper. I am continually astonished by my children's energy, sweetness, and intelligence. Any accomplishment in the last six years is ultimately for and because of them.

## **ABSTRACT**

The promotion of planned pregnancies has long been a goal of women's reproductive health researchers and advocates within the United States. However, almost half (49%) of all pregnancies in the U.S. are unintended (Finer and Henshaw, 2006). The goal of this research is to increase understanding of intentionality, from expanding upon established antecedents of pregnancy intention to examining the effect of pregnancy intention on the utilization and evaluation of reproductive health services.

The first study examined the relationship between pregnancy intention and satisfaction with prenatal and hospital-based labor and delivery care. Results revealed that women with unwanted pregnancies were more likely to report lower satisfaction with their prenatal care provider, their provider's communication skills, and with their perceived sense of control during labor and delivery.

The second study examined the potential for pregnancy history as an antecedent of pregnancy intention in a nationally representative sample of women ages 15-44. Separate analyses were further conducted to examine if these hypothesized relationships changed as women aged. Pregnancy history, in particular a history of prior unwanted pregnancy, was found to be significantly associated with an increased likelihood of subsequent unintended pregnancies. Conversely, women with a history of younger age at first pregnancy and/or pregnancy loss were less likely to report their pregnancies as unintended. When analyzed separately by age group, the relationship between pregnancy history and pregnancy intention were generally strongest for women ages 30-44.

The final study tested the relationship between pregnancy intention, pregnancy history, and the utilization of pregnancy prevention services, specifically utilization of

contraception during the interval between pregnancies and the election of post-pregnancy tubal sterilization. Pregnancy history was found to be significantly associated with the contraceptive use. Women who first became pregnant before age 30 were more likely to utilize contraception in the pregnancy interval, while a history of both unwanted pregnancy and pregnancy loss were negatively associated with this outcome.

The relationship between pregnancy history, pregnancy intention, and the evaluation and utilization of reproductive health services, further complicated by influence of age, supports the view of intentionality as a complex and potentially influential construct.
