2012

For my lovely daughter Eleanor.
And to Adam, for his unwavering love and support.

ACKNOWLEDGEMENTS

I would like to express my sincere appreciation to the members of my doctoral committee, Siobán Harlow, Bill Herman, Bin Nan and Lynda Lisabeth. Dr. Harlow provided invaluable personal and professional support, and she has a true commitment to mentoring doctoral students. Thank you to Dr. Herman for sharing his expertise in peripheral neuropathy and diabetes, his willingness to fund assays for my work, and his timely feedback on my writing. Thank you to Dr. Nan for his statistical expertise, and thank you to Dr. Lisabeth for her willingness to join my committee at the last minute despite her busy schedule. I appreciate all of your time more than I can express.

A special thanks to Kathy Welch, my SAS guru, in CSCAR.

My very first friends here and my comp exam study group: Yamini, Brian, and Pangaja.

My experience at the University of Michigan would not have been the same without you.

My fellow CIACD doctoral students: Eileen, Flo, and especially Carrie. Thank you for your friendship and willingness to read my work. Carrie, I don't think I could have made it without you and I look forward to our continued collaborations.

It is not easy to have a baby during this process and numerous people supported and encouraged me. I would not have been able to survive without support from Sharon Kardia and Allison Aiello, who hired me as a GSI with a 4 week old infant, and Sarah, Carrie, Brian, Pangaja, Jana, Erin and many others who baby sat for me during meetings, office hours, CSCAR appointments, and while I proctored exams. I will be forever grateful.

Thank you to the SWAN participants who are willing to come back year after year...this research is yours.

Thank you to the SWAN clinic staff and the CIACD office staff, in particular Charlotte, who runs the research process, and Steffenie, my encouraging office mate.

To the SWAN Thursday morning group, thank you for being a safe space to present early drafts of this work.

Finally, to my husband Adam. Thank you for your unwavering support and love. I think everyone should have a partner that believes in you more than you believe in yourself. I don't think I will ever know how I got so lucky.

I never imagined that I would complete this work without Dr. MaryFran Sowers, my advisor and mentor of 3 years. I am so sad that she passed away before she could see this work come to fruition. She was a much bigger influence on my life and work than I realized during her lifetime, and I miss her every day at the office. I still expect to see her each morning when I arrive. She was famous for coming up with hypotheses that always seemed to work out. Peripheral neuropathy was one of those hypotheses. She convinced me to work on it for my dissertation, and even though she never saw the full results, I know she would have been ecstatic. She correctly identified that I usually needed to work on “selling” my work- and on more than one occasion, she said “sell it, Kelly. Peripheral neuropathy isn’t sexy, but it’s important.” So, for MaryFran, I hope that my dissertation proves the importance and relevance of peripheral neuropathy.

ABSTRACT

Prevalence, Risk Factors, and Sequelae of Peripheral Neuropathy in a Population-Based Cohort of Mid-Life Women

by

Kelly Renee Ylitalo

Chair: Siobán D. Harlow and MaryFran R. Sowers (Deceased)

Peripheral neuropathy is a well-documented complication of diabetes, yet it remains an underappreciated condition in non-diabetic individuals. Studies of neuropathy in longitudinal or population-based samples are limited. The goal of this dissertation was to document the burden, risk factors, and sequelae of peripheral neuropathy in a population-based sample of Caucasian and African American women in the United States.

This dissertation utilized 1996-2008 data from the Study of Women's Health Across the Nation – Michigan site. Annual anthropometric and performance-based physical functioning measures were collected and peripheral neuropathy was assessed in 2008 using three independent assessment methods. We described the associations between individual characteristics and neuropathy, and determined if anthropometric and

physical functioning trajectories differed between women who did and did not have prevalent neuropathy in 2008.

The prevalence of peripheral neuropathy was substantial and ranged from 14.3% to 20.0% depending on assessment method. On average, body mass index, weight, and waist circumferences increased over time and differed significantly at baseline through 2008 between women who did and did not have neuropathy in 2008, even among women without diabetes. However, when we examined trajectories of anthropometric measures, slopes did not differ, suggesting that age-related increases in body size were constant over time between women who did and did not have peripheral neuropathy in 2008.

On average, physical functioning declined over time and differed significantly between women who were and were not found to have neuropathy in 2008. Women who had peripheral neuropathy in 2008 had poorer physical functioning, and for some measures, a steeper rate of decline over time, than women who did not have neuropathy in 2008.

This dissertation expands our understanding of the burden of peripheral neuropathy in mid-life women. The high prevalence of neuropathy is a growing public health problem and is underappreciated as a potential cause of functional decline. Clinicians should implement peripheral neuropathy testing for individuals of the general population who exhibit diminished functional capacity. The co-occurrence of peripheral neuropathy

with obesity and poor physical functioning may explain the high prevalence of disability reported among women in the United States and deserves further research.
