

Supplementary Table 1. Rainwater sampling location, date and time of collection, measured surface air temperature (T), noble gas concentrations and measured He isotopic ratios (R) normalized to atmospheric He ratio (Ra). Samples from Milan and Ann Arbor were collected at altitudes of 215m and 290m a.s.l respectively. Surface weather station records used to derive appropriate precipitation characteristics for corresponding rainfall event is also indicated

Sample	Location	Date	Time	T	He	Ne	Ar	Kr	Xe	R/R _a ^b +/- 1 _S	Surface weather station

^aUTC is Coordinated Universal Time. UTC=Eastern Standard time+4 hours during daylight savings in USA.

^bR is the measured ${}^3\text{He}/{}^4\text{He}$ ratio and Ra is the atmospheric ${}^3\text{He}/{}^4\text{He}$ ratio of 1.384×10^{-6} [Clarke *et al.*, 1976]

^cExcept for nr5-1 and nr5-2, all other samples were collected on the same day and almost at the same time (± 1 hour) indicating that they are likely from the same storm system
