Description of Collection Unit

Will excavate 20 m² area to include low density of artifacts - low density of artifacts, low density of artifacts, low density of artifacts. Loose cobble fill to be present for low density of artifacts. The next level will be excavated of low density of artifacts - low density of artifacts. Low density of artifacts, low density of artifacts. Concentration mostly on N-S sides of excavation unit.

Interpretation of Collection Unit

Artifacts include lower sequences of human/animal remains (low density of artifacts) and more recent pollen is present.

Burial Form

Lawrence believes the large stones covered by cobble fill may represent the floor of the most recent interment. I began clearing the E. side of Unit 1 to bring it to level with the rest of the central grave. I have uncovered what appears to be additional Stone Slabs similar to those already exposed. This may be evidence of an earlier grave. Because of confirmed looter activity in this region and esp. at T99, excavation will not continue within the central grave until a full day of work can be devoted to investigating the nature of the new "slabs". One Slab appears to extend beyond the E. border of central grave, while another may be present in the NE corner of the central grave. Extension of LUL 3 was brought to level at inner bank of Q1. Matrix is identical to that of central grave → Medium-sized stones deposited over small cobble fill. Shells are present in the soil. The sole find was a single human phalanx. ~~No pottery or other artifacts have been recovered.~~ To protect the potential slabs from looters, the area will be covered with tarps and soil.

The matrix in the central grave is significantly different from the other excavation units, leading us to the interpretation that they represent the prepared floor of the burial, which appears to have been excavated and removed by looters. ^{coarse fill, hand or foot}

Description of Relationship with other CUs

Description of Collection Unit

Matrix consists of rock pebbles, soil. Matrix here is very different from rest of the mound. Another cut slab was uncovered at SE corner of unit and is horizontally placed. Artifacts include faunal remains, first hand phalanx - m. distal end in soil. Small pebbles and soil is present beneath larger rocks.

Interpretation of Collection Unit

Large root in NW corner of unit may indicate presence of cavity deep within grave which could represent presence of an earlier burial.

Description of Relationship with other CUs

Description of Collection Unit

Level 006 was excavated to sterile gravel layer. no artifacts were recorded in this level and no human burials were observed. It will be the final level excavated in the central grave. After photos are taken the grave will be backfilled to preserve the stability of the stone slabs.

Interpretation of Collection Unit

The lack of earlier graves within the central grave suggests the mound was constructed specifically for the looted burial.

Description of Collection Unit

Each bucket of soil was screened. Northern length of Q1 is 8m long. Unit Z is 2m x 7m in length. Bone recovered from this unit may be scatter due to the disturbance of the central grave (unit 001). Artifact density is relatively low, consisting of prehistoric sherds, modern glass, shell casings. Level was excavated until change in soil, which appears as a tough, hardened, compact layer.

Interpretation of Collection Unit

Fill (prehistoric) consists of soil & rock (of all sizes). Rocks were intentionally placed in order to build up mound.

Description of Relationship with other CUs

Description of Collection Unit

This test strip was excavated in order to determine the edge of the tumulus. Upon excavating, change in soil - coupled with rocks in a seemingly linear formation - was observed. This rock formation appeared to be a peribolos. Lorene visited site and determined that this was natural. Rocks were documented as feature 001.

Description of Relationship with other CUs

Description of Collection Unit

This was excavated as a test trench in Q3 and was the sole trench excavated in Q3. It was approximately 2 x 7 meters. The strata was similar to that of all other excavated units = top stratum consisting of rock (of all sizes) and loose soil. Middle stratum consisting of hard, compact brown layer w/ little to no rock. Lower stratum consisting of sterile gravel. The rocks in the top stratum, however, are fewer in number than those of other quadrants. Perhaps the surrounding topography contributes to this? *spindle wheel recovered near edge of mound, w/1 unit.

Description of Relationship with other CUs

Description of Collection Unit

A portion of the bank b/w quadrants 1 and 2 was removed in order to excavate this unit, which was located along the eastern edge of the central grave. The strata was similar to that of all other excavated units = top stratum consisting of rock (of all sizes) + loose soil; middle stratum consisting of a hard, compact layer; lower stratum consisting of sterile gravel. This unit was excavated in order to view the eastern profile of the central grave. Along the eastern wall of the central grave, a burial slab was exposed - unfortunately, the slab fell from its in situ location before photos or drawings could be made. Matrix was similar to rest of tumulus, with the exception being the central grave. Recovered artifacts: one human bone, 15 faunal elements; 3 sherds - two of which are prehistoric.

Interpretation of Collection Unit

Prehistoric fill consisting of soil & rock.

SW Corner of Trench y: x:

Description of Relationship with other CUs

Description of Collection Unit

Once T99-04-012-001 was excavated down to the surface of the sterile gravel, this unit was created in order to assess the western-most profile of the central grave slabs. This unit was excavated at a depth of an additional meter beyond that of 012. This unit measured approx. 0.5 x 0.75 meters. A portion of the matrix nearest to the surface (and extending to an approx. depth of 10-15 cm) was similar to that excavated w/ the central grave (unit 001). This matrix consisted of very fine, smooth pebbles & small rocks. Below this matrix, all subsequent strata resemble that of all other excavated units = fill of rocks & loose soil, followed by a compact layer, then sterile gravel.

Interpretation of Collection Unit

Prehistoric fill consisting of soil & rock.

SW Corner of Trench y: x:

Sketch (Import)

Throughout the excavation of this unit, the profile of the southern-most central grave slab was exposed & extended down into the "fill" strata of the unit. Artifacts recovered = 6 faunal elements; 1 lithic; 1 modern tile.

Final Interpretation of Collection Unit (Post Excavation)

Compact Brown prepared for cultural deposition of rock, soil. Brown is natural but perhaps leveling is cultural. Pebble fill nearest surface used to leverage central grave slabs into place.
