<p>Author recommendations for harm prevention</p> <p>Development &amp; Research of patient transport systems</p>	
<p>Existing guidelines for intra-hospital transport mentioned or included?</p> <p>Ref #9, 12</p>	
<p>References to pull: Please include reference # from manuscript and pubmed ID or DOI if provided</p> <p>#4 - email      #11 pulled</p> <p>#8                      #16</p>	

Your comments / notes:

Bundle reduced waiting time, Transport time, Improved satisfaction  
 improved "nursing score" (not defined) and reduced adverse event rate  
 from 19% to 11%. "Successful rescue" (?mortality? Not defined)  
 improved  $\bar{c}$  bundle from 89.74% to 95.60%.  $P=0.009$   
 No mention of time spent performing bundle tasks.

Bias assessment questions

Circle One

Bias assessment questions	Yes	Can't tell	No
1. Did the study address a clearly focused question / issue?	Yes	Can't tell	No
2. Is the research method (study design) appropriate for answering the research question?	Yes	Can't tell	No
3. Are both the setting and the subjects representative with regard to the population to which the findings will be referred?	Yes	Can't tell	No
4. Is the researcher's perspective clearly described and taken into account?	Yes	Can't tell	No
5. Are the methods for collecting data clearly described?	Yes	Can't tell	No
6. Are the methods for analyzing the data likely to be valid and reliable? Are quality control measures used?	Yes	Can't tell	No
7. Was the analysis repeated by more than one researcher to ensure reliability?	Yes	Can't tell	No
8. Are the results credible, and if so, are they relevant for practice?	Yes	Can't tell	No
9. Are the conclusions drawn justified by the results?	Yes	Can't tell	No
10. Are the findings of the study transferable to other settings?	Yes	Can't tell	No

For interventional studies only:

Patient Population critically ill patients in ER needing intra-hospital transport, age 15y+  
 Intervention Bundle of measures: pre transport assessment, education + Plan; dedicated monitoring, person doing transport; Pat-transport record  
 Comparator waiting, previous routine care  
 Outcome waiting time, transport time, "nursing score", Patient satisfaction, accident rate

more physicians on transport for sicker patients  
after default P=0.019

Your comments / notes: Daytime 9:00-6pm  
Study of adverse transport events pre- and post-checklist implementation.  
Includes adult ER patients taken to another part of hospital including floor, ICU, Cath lab, Surgery, endoscopy or Radiology.  
Events collected were ID/consent issues; O<sub>2</sub> supply; monitor issue; SBP > 200 < 90;  
SpO<sub>2</sub> < 90; P=0.001  
Unreported events ↓ 36.5% to 22.1%. Serious ↓ 9.1% to 5.2%. P=0.005

Bias assessment questions

9. Are the conclusions drawn justified by the results?	Yes	Can't tell	No
10. Are the findings of the study transferable to other settings?	Yes	Can't tell	No

For interventional studies only:

Patient Population ER patients age 15y + transporting to another part of the hospital  
Intervention Checklist pre-transport and 4 hour course  
Comparator Pre-checklist, ER  
Outcome vital sign derangement, equipment issues (all checklist content)

Your comments / notes: Prospective observational study on VAP looking at a variety of risk factors including transport. Inclusion criteria included age >18y but children were included. Logistic regression showed an independent effect of transport ↑ VAP rates (OR 3.84). Due to supine position, ~~alteration~~ seeding of ETT during manipulation, or just a marker for worsened disease burden.

Your comments / notes:

ICU patients - no difference in # vitals outside range <sup>in ICU patients</sup> ~~after~~ during or after transport as compared to before transport.  
 # and duration of vitals  $\Delta$ 's ('insults') correlated with # and duration of moves before and after the move.  
 ↑ injury severity score correlates with ↑ insult number.  
 Transfer from ER - higher insult rate than transfer from ICU; higher post-transport ~~rate~~ <sup>transport insult</sup> rate

Predictors of  $\Delta$ 's in study were sensitive but not specific

Your comments / notes:

98 patients age 16+, both intra- and inter-hospital transport. Looked at  $\Delta$  in  $P_{aO_2}/F_{iO_2}$  ratio, created predictive model.

Patients with pre-transport  $F_{iO_2} < 0.5$  were on 60% during transport.  $> 0.5$  were on 100% during transport.

55% of patients had  $\downarrow$  in PF ratio. <sup>only</sup> 10% of them recovered in 24 hrs. Other study (Waydhas): 84% had  $\downarrow$  PF ratio; 43% lasting  $> 1$  hr post transport. Ventilator type made no difference; duration had no impact. Likely disconnected (as per 02)

Your comments / notes:

Observational study on patients post-anesthesia and degree of desaturation during transport (90-240 sec duration). Included few children. Intraoperative ventilation strategy and area of incision recorded; difference.

Bias assessment questions

Circle One

- | Bias assessment questions   | Yes | Circle One | No |
|---|-----|------------|----|
| 1. Did the study address a clearly focused question / issue?  | Yes | Can't tell | No |
| 2. Is the research method (study design) appropriate for answering the research question?                                     | Yes | Can't tell | No |

<p>Author recommendations for harm prevention  Regular trays for manual ventilation using test lungs and/or spirometer.</p>	
<p>Existing guidelines for intra-hospital transport mentioned or included?  Yes SCCM 1988</p>	
<p>References to pull: Please include reference # from manuscript and pubmed ID or DOI if provided  ✓ Ed - no new references</p>	

Your comments / notes:

20 adult (youngest 17y) intubated ICU patients  
looked at ABG, BP, HR and arrhythmia before and after  
transport. I had  $\uparrow$  PCO<sub>2</sub>  $\downarrow$  PO<sub>2</sub> due to O<sub>2</sub> disconnection and  
clamped chest tube. I had hypervent. later (not ped'icute)
